**Hereditary Power.**—Every true American citizen must have blushed with shame on seeing the remarkable claim to hereditary power so practically illustrated recently by the Cameron family. The senior Cameron in the United States Senate, by his act says: "This is no representative government; it is all bosh to say that our legislators, heads of departments, members of the cabinet, and rulers, are the choice of the people; the best political tactician, boldest and most ingenuous pleader, and the one with the longest purse, will ever hold the reins, and the masses will submit to the harness to which they are getting so much accustomed." And the successful carrying out of this doctrine seems to prove that the ex-Senator is not far astray. The junior Don Cameron, when scarcely relieved from the duties of Secretary of War, is apparently just as easily planted in the father's Senatorial chair by a move on the political chess-board, as a son is made to succeed the old man in the management of any ordinary business. The people, who should be the sovereigns, are not consulted—simply the desired signal is given to those who are holding the places of legislators at Harrisburg, and the little thing is accomplished. True, there were found a few State representatives who battled manfully against the order; but the requisite number came to time when the roll was called, and the hereditary power of the Cameron family became established. And why not? If *right* be the measure of *might*, should we not yield, and cheerfully too, to the powers that be? If the power conveyed by the Constitution to the people is null and void, why raise a protest against the new order of things? Somebody must make our laws; some one must give advice to the President, or be at the head of the great bureaus at Washington, and why not a Cameron as well as anybody else? Then, to make the matter more complete, why not recognize the right and power of all others in our State and national halls to have their sons succeed them, as their hereditary right and God-given privilege? This would save a vast amount of political strife and contention. Torches, banners, parades, all the expenses and paraphernalia incident to office-seeking and money-getting would be done away with. The talent and eloquence used in political campaigns could be diverted to temperance, education and morality.

Thus reason the advocates of all monarchical governments. The soothing powder always precedes the slumber. It is administered, too, in a sort of homoeopathic doses, not like it to permanently alleviate, but rather to deaden by gradual process, like opiates, all the higher and better elements in the great system of government. If the Cameron dose does not agitate or convulse the patient too much the next prescription can be made a little stronger, until the subject loses sufficient vitality to prepare him for a sort of negative acquiescence to the new manifestations of power.

The advances upon the rights of the people are made only by degrees, so as to make the shock slight and resistance small. They are, nevertheless, steps made not to the music of the Union, nor for the enlargement of individual liberty.

We fear not for the safety of the republic; but it is well that every patriot should be on his guard to crush all efforts calculated to foster caste, aristocracy or imperialism. The blessings of political and religious freedom can only be transmitted to our children unimpaired, by sacredly watching

the train of events as it passes before us, and by stamping the seal of condemnation on all that militates against "the greatest good to the greatest number."

**Christian Missions among the Jews.**—The Rev. Josiah Miller, Secretary of the London City Mission, says that among the 5,000,000 Jews in Europe Christian missions employ only about 220 agents, with an annual expenditure of £67,000.

"Modern Protestant Christian Missions to the Jews began with the Society, which afterward divided into two parts—the larger, the 'London Society,' having at the present time an annual income of about £37,000 and 118 agents; the smaller, the 'British Society,' with 27 agents and an annual income of about £8,000. In addition to these, there is the mission of the Presbyterian Church in Ireland, that of the Presbyterian Church in England, and that of the United Presbyterian Church in England. There are also several small societies on the Continent and two very small ones in America. The London City Mission aids in the work, and there is some useful work due to individual Christian enterprise. London, with 30,000 Jews, has twelve missionaries; Warsaw, with 90,000 Jews, has only two or three missionaries; and large towns in Austria, Roumania, and Russia, with from 20,000 to 50,000 Jews each, have but one missionary each, and in some cases are wholly without Protestant teaching. The countries with large Jewish populations, and especially destitute of missionary efforts at present, are America, where the Jews are increasing in numbers rapidly; Northern Africa, and especially Morocco, and Arabia; and above all, Russia."

Mr. Miller is not able to point to any very remarkable instances of success. In Rome, where a mission has existed every year and been "conducted with zeal and ability," there is not yet a single convert. Perhaps the most successful work has been done in London, where there have been 1,395 baptisms.

**Sunday-School Congress.**—At the recent anniversary of the Methodist Episcopal Sunday-School Union, in Cincinnati, Dr. Vincent, Corresponding Secretary, made the following report: Number of Sunday-schools in the Methodist Episcopal Church, 19,379—increase during the year, 273 officers and teachers, 209,623—increase, 3,010; scholars, 1,441,959—increase, 43,028; conversions, 98,554—increase, 23,392; maximum circulation of the *Sunday School Journal*, 115,000; *Sunday School Advocates*, 305,000; *Normal Class*, 2,000; picture lesson paper, 125,000; *Berean Quarterly*, 7,000; *Berean Leaf*, 1,200,000; the *Church Teacher*, 40,000; the *Five Years*, 36,000; number of bound volumes of text-books, 90,933; number of bound volumes in libraries, 133,926; whole number of pages published, 157,615,200. The first Sunday-School Congress was held in connection with the anniversary. All that was done, so far as appears from the report of it, was the asking and answering of the question, "Why is it desirable to hold throughout the country a series of Methodist Episcopal Sunday-School Congresses?" The answers were: "To concentrate our forces; to educate our people in the work of our churches; to bring forward the best ideas of our people; to secure our young people to the Church, when converted; to secure practical reports of our Sunday-school work, greater unity between the congregation and Sunday-school; to promote the study of the Church discipline on the part of pastors, Sunday-school superintendents, and presiding elders."

**Rochester Theological Seminary.**—The following are the statistical items concerning Rochester Theological Seminary: Students who have completed a full course of Seminary, 307; students who have taken a part of the Seminary, 131; total number who have up to the time pursued studies in the German Department, 61; now living, not including undergraduates who have been pastors of churches, 429; engaged in pastoral work, 286; presidents or professors of colleges and seminaries, 34; foreign missionaries, 25; home missionaries, 22; secretaries or agents of benevolent societies, 15; superintendents or principals of schools 15; chaplains, 10.

**Evangelical Work in Constantinople.**—There are seventeen places of Evangelical worship in Constantinople and its suburbs. Christian work is carried on by the American and British and Foreign Bible Societies, the American Board, the Free Church of Scotland (among the Presbyterians), the Established Church of Scotland (among the Presbyterians), the London Jewish Society, and the (Anglican) Church of England Society. There are six educational institutions; two are American. The Bible Societies issued in 1880, Scriptures, in whole and in part in twenty languages.

**Dartmouth College.**—The Dartmouth faculty report that the result of the new plan of admitting students without any examination is working even better than anticipated. It makes the first three months of the year a virtual examination, and it is thought that the effect of being dropped at the end of that time has had a beneficial effect in increasing the studiousness of the freshmen.

Among the graduates of Dartmouth there have been 15 Judges, 15 United States Senators, 61 Congressmen, 1 Cabinet Officer, 4 Foreign Ambassadors, 1 General, 14 Governors of States, 1 Governor of a Territory, 25 College Presidents, and 24 Professors in other institutions.

**Oxford University** has an annual income of £1,200,000; a library of 520,000 volumes, and 1,300 undergraduates.

**The Friends' Mission in Burma.**—The mission is completing a large and convenient building, and is reported to be prospering.

**German Universities.**—Six Universities have more than one thousand students each. Berlin take the lead, having respectively 2,731 students. In the twenty-one Universities of the country there are 17,143 students and 1,827 teachers. The number of Protestant theological students is as follows: Tübingen, 260; Halle, 190; Erlangen, 196; Heidelberg, 9.

**Extra Session of Congress.**—The day for an extra session of Congress has been fixed for June 1. This late date was fixed so as to have the shortest session as possible, and so that the President might give the President ample time to get his running order to assist the onslaught on the reform policy, which is expected as soon as Congress meets.

## LITERATURE AND ART.

**The History of Bucks County, Pennsylvania.** By W. W. H. DAVIS, A.M. 8vo, 930 pages. Published by Democrat Office, Doylestown, Pennsylvania.

This volume, inscribed to the Hon. Henry Chapman, a descendant of John Chapman, the first settler north of Newtown, Pennsylvania, comes to us bound in very attractive form, green cloth, and in matter replete, giving the history of Bucks County, Pennsylvania, from the discovery of the Delaware to the present time. The author in this book has added materially to the general stock of historical knowledge, and we might add that his labors to bring forth this publication will, in our opinion, be recognized and appreciated long after a number of his other works shall have succumbed to the shocks of time.

In his preface, the author says: "The writing of the 'History of Bucks County' has been more a 'labor of love,' than of gain; it was undertaken from a desire to preserve interesting facts connected with its settlement and history, but in a few years would have been lost forever; and no reasonable compensation would reward us for the seven years' labor bestowed upon it. We labored under many difficulties. Its story had never been written, and the material, in a great measure, had to be first gathered in isolated facts, and then woven into the thread of history."

The scope of the book is so broad, and the subjects all treated so exhaustively that we can hardly in a brief like this do the matter justice. It will suffice us to say that the settlement, growth and development of all the moral and material interests of the people and County are separately and collectively examined, weighed and discussed in their past, present and prospective future bearings. The horticultural, agricultural, garden, farm and forest values are carefully observed. The feathered tribe also get a favorable notice from the author. Maps and illustrations give increased attractiveness to the excellent typographical work of the printers.

**American Journal of Numismatics and Archaeological Societies.** Published by the Boston Numismatic Society.

The April number of the Quarterly furnishes a fund of information on "The Coins and Currency of Modern Greece," by Fisk P. Brewer, late United States Consul at Athens, Professor of Ancient Languages in the University of South Carolina. The Masonic medals can scarcely fail to interest members of the Order.

**Twenty-second Annual Report of the Board of Controllers and the Third Annual Report of the Superintendent of Public Schools of Allegheny City, Pennsylvania.**

Mr. John Davis, Superintendent of the above schools, favors us with a copy of his report for the year ending 1876. From it we glean these facts: That the number of pupils enrolled for the year was 9,129, an increase over preceding year of 319; the cost of tuition per pupil is increased from \$14.75 to \$15.34 per annum. In this report, Mr. Davis says, "the

best and most useful citizens are, as a rule, the best educated," to which we can readily agree. "If the mind and heart are properly trained and educated in early life, there is certainly less risk of depraved manhood," is also a truth too easily demonstrated to dispute. The question, however, comes up, What is meant by *properly trained*? While we do not doubt that the schools of Allegheny City will compare favorably with schools elsewhere, we are very far from admitting that our free schools train or educate properly for the great duties of life. They move in that direction, and accomplish much good, but that they sadly *fail* in turning out young men and young women fully equipped for fighting successfully the battles of life, is too potent to the seeing eye and thinking mind to admit of dispute. [See article on "Education and Tact" in this number].

**Magazine of American History, with Notes and Queries.** JOHN AUSTIN STEVENS, Editor. New York: A. S. Barnes & Co., Publishers.

This monthly periodical is now before us; as we turn its leaves over we are impressed with the idea that editor and publishers are awake to the subjects which its title includes, and that they propose to give to the lovers of American History reliable matter and typographical work of the first order, and on a superb quality of paper, too. The April number opens with "The First Sea Fight of the Revolution," by Foxhall A. Parker; followed by "Massacre at Falling Creek, Virginia," and other subjects of note and interest to the general reader and student. In aim, form and size the publication is similar to the "American Historical Record," published by John E. Potter & Co., and which was started in 1872, under the editorial management of Benson J. Lossing; now merged into POTTER'S AMERICAN MONTHLY. We congratulate Mr. Stevens and Messrs. Barnes & Co. on their auspicious beginning with their magazine, and extend the hope that it may find many friends and subscribers. The position and influence of the editor and the well-known character of the house should greatly favor its success. As librarian of the New York Historical Society a liberal patronage should come to Mr. Stevens from that organization, and the very large circle outside which its more active members can reach and influence. Such a publication merits success; but experience has shown that to firmly establish such a magazine, devoted to a specialty, is rather up-hill work. There are too many negative characters in the country, and too few really positive, to make the reward for such labor and talent as this periodical must employ fully commensurate with either. We, nevertheless, trust that this monthly will be sustained, and it certainly will always find a welcome to our editorial sanctum.

**Centennial History of Licking County, Ohio.** By ISAAC SMUCKER. Newark, Ohio: Clark & Underwood, Printers.

As its name purports, this book (16mo, 80 pages, cloth) gives in condensed form the history of Licking County. The style is vigorous and entertaining while dealing with the dry

facts relative to the date of settlement, character of the pioneers, etc., to this now prosperous part of Ohio's domain. "Less than a century ago, the County had no existence as an organized community," says the author. It now blossoms with churches, school-houses, and all the higher evidences of civilization. These "Centennial Histories" of Towns and Counties are always hailed with satisfaction, as they add very materially to the stock of our nation's history; much material which might be lost is gathered in this way, and preserved in compact form for the information and guidance of those who come after us.

### First Principles, and Art's Domain.

—That place, person or thing from which or whom emanates power in any of its multifarious forms, we generally consider as the fountain head, provided it be the primary source or represent the original or First Principles. From this definition we are literally led to the conclusion that there are just as many, neither more nor less, *original* sources of power as nature and human thought and ingenuity have supplied. For instance, we have the fountains of natural light and artificial light; natural darkness and artificial darkness; natural beauty and artificial beauty. So do we see evidences of natural taste and cultivated taste, mental and physical; and throughout the whole circle of natural and organized forces we can easily trace back to one or two kinds of causes, natural or artificial. The stream may appear but a silver thread at its source, still it represents just as completely as if a mighty river, **FIRST PRINCIPLES**; and these belong to either one or the other of the two chief sources of power. It is indeed remarkable, when we group all the fountain-heads together, to see how few there are compared with the almost countless number of claimed *original* springs or powers. In the field of Literature perhaps no less than in those of Science, Art and Education, do we find a hundred imitators and copyists where we discover one creative source or fountain-head. There never lived but one Michael Angelo in the temple of

Art; but one John Bunyan was ever cast into prison; one Tom Moore to give the world such melodies; only Isaac Newton in the field of Astronomy; and as an original teacher, but one Pestalozzi, each in his order and in his Elocution points also to few with the native fires of a Patrick Henry and a Louis Kossuth. And how refreshing to be able to drink at and from the *pure* fountain-head. There we find that no adulteration has taken place; that we are gathering the true sap from the original vine, and fruit from the original tree, to replenish exhausted nature and impart a new vigor of life to the thirsty mind or wearied body.

JACOB'S WELL.

Still we should undervalue the benefits conferred on mankind through the agencies of imitation, and those who have brought to the world the fruits of *acquired* wisdom, no matter from what channels or by what means drawn. Compare the many, there probably always, but a few spirits of great or distinguished originality, as moulders of thought; but few possessed of such fine springs as to best almost the multitudes with their great characters which rise up above the base like glimmering star constellations. The brilliant men and women, while some of the first magnitude, having orbits that in broader spheres of usefulness, have not faded, and will doubtless so continue, till the end of time, to perform offices or duties which devolve upon classes

of less magnitude. Both might be compared to major and minor keys of a great organ, each independent of the other in the production of complete, delicate, lofty, soft and grand vibrations, such as charm, instruct and elevate the human race.

These observations prepare us for the subject in mind, **DOMAIN OF ART**. In the May number we gave a sketch of the "Domain of Literature" to show that mainly through Literature, does the great river of human history flow. We have perceived that the ear and eye bring to us such knowledge only as comes within the province of our individual travels and experience. And how limited that is with

From the Superb Frescoes of Michael Angelo in the Sistine Chapel, Rome.

of us! The pure and never-failing streams, in most cases, reach the mind and heart through what we read, rather than what we see. Were we to confine ourselves to the wisdom which our own lives furnish, it would scarcely do to pilot others safely through life's boisterous sea. It is only by gathering the wisdom exhibited in many lives, widely scattered, and with diversified climates and surroundings, that we can construct a chart safe and sure as a guide for other voyagers. We must be able to draw continually from the great fountains of human experience and wisdom.

The domain of Art is so closely allied to that of Literature that when we come to reach the summit of one we are brought face to face with the other. Art is not confined to the painted canvas, the frescoed ceiling, the engraver's block, or the sculptured marble; nor are the easel, pencil, brush, point and chisel its only tools. Its domain and its subjects reach out and take in, like Literature, the various phases of human life. Art gives us representatives of both the real and the ideal, as they appear to the eye, the mind, or heart. As it approximates perfection, it transfers almost life to the canvas; nay, more, by the magic touch of the true artist, Art is made to disappear, and nature itself to speak with silent power. As in Literature we see the emotions which move and control mankind, so in Art we witness the very impulses which are the springs of action. To both can we go for instruction, and if each be true to itself there may we drink from the almost exhaustless fountains. Towards them in all ages have flocked the lovers of the true and the beautiful, just as the pilgrims of old directed their footsteps to the fountains of Love and Holiness, that they might quench their thirst, as we see in our illustration the maiden, child and man satiating their long desire at Jacob's Well, with the "pure and sparkling water." Thus it is the world over—at the shrines of Art, the palaces of fashion, halls of learning, offices of worship—humanity draws from the wells of human knowledge.

A single work of Art calls into play not only knowledge, wisdom, and experience, but what might perhaps be named inspiration. A masterpiece may also have required the greater portion of a lifetime to conceive, plan and execute; and with the artist's triumph over all obstacles, and justly-won glory in his profession, the shaft of envy may, as it not unfrequently does, mar the monument of his skill. As appropriate to this subject and place, our readers may appreciate a brief

#### HISTORY OF A PICTURE.

Two of the most celebrated artists the world has ever known dwelt in the same city. One delighted in delineating beauty in all its graces of tint, form and motion. His portraits were instinct with the charm of physical vigor. The graceful, half-voluptuous outlines of form and feature harmonized with delicately blended tints. On his canvas, the homeliest faces had an almost irresistible charm. The other found pleasure only in depicting weird and gloomy subjects. Above all, did he excel in painting the portraits of the dying. The agonizing death-throe, the ghastly face and form, were all depicted with marvelous fidelity. There existed between these artists the most intense dislike. At length this dislike culminated. The beauty-loving artist had been engaged in painting the portrait of a beautiful woman. Connoisseurs pronounced it the most wonderful piece of art that had ever been produced. His brother artist was jealous of his fame and sought revenge. By bribing the keeper of the studio he gained access to the picture each night. At first he was content to only deaden the brilliancy of the complexion and eyes, efface the bloom from the cheek and lip, and paint a shadow on either cheek. Later, his strokes grew bolder and freer, and one morning the artist awoke to find the entire outline of the portrait changed. He could scarcely recognize in the emaciated form and haggard countenance the glowing conception he had embodied. The pallid face and expressionless eyes he had attributed to a lack of genuineness in his materials; but when the outlines were changed he suspected the cause and indignantly dismissed the keeper. What the revengeful artist marred by a few rapid strokes of his skillful brush was only restored by years of patient industry.

From the Superb Frescoes of Michael Angelo, in the Sistine Chapel, Rome.

**Impure Literature.**—Would that these fountains were always pure; but then we should realize more than ought to be expected from erring human nature. The steady increase of impure literature is, however, a just cause for alarm. With the rose we find the thorn; but the latter is not essential in the reading matter of the day. Still one would think on seeing the extensive traffic in poisonous circulars, stories and books, that the tastes of the young, and in many instances of those older, were becoming more and more depraved. This we do not believe, while we at the same time see the growth of such publications, and are not blind to their evil influences. The mind and heart of the boy or girl are very susceptible of any sort of influence, and so long as such traffic *pays*, it will prosper, and our children's morals are endangered. Our hope lies in wholesome ordinances and laws, rigidly enforced, for the suppression of everything calculated to corrupt the pure stream of literature.

If asked to what class of publications we specially refer, we would say that we mean the flashing newspapers and cheap novels which are offered for sale to half-grown boys and girls by their vendors, or thrust gratuitously into their hands as they pass, with the certainty that they will buy the succeeding number. Very few girls and fewer boys, unless they have been forewarned, can resist the tempting dramatic

pictures of kneeling women, with streaming hair, bravely armed to the teeth, etc. The open chapter seems harmless enough, and the boy or girl, reared most probably in a refined and Christian home, plunges unchecked into this class of kitchen literature. Without being actually obscene, these magazines suggest a great deal that is wrong. The views of life they present are those taken from the grog-shop and gambling saloon; their very atmosphere is crime. A boy who would be simply disgusted by the open vice of these publications which the law prohibits, accepts the concealed poison in these without suspicion. When we read of murderers of fourteen years old, of burglars of nine, of delicately reared girls in the first bloom of innocent youth leaving their homes and coming to this city in the mad desire for adventure, to be rescued on the very verge of ruin, we can trace the motive cause in most cases to these publications or their dramatization on the boards of variety theatres. Even the best class of juvenile literature belonging to the present day there is too much of fever and unrest. The child's brain, crammed and forced at school, is still further heated by tales of wild adventure or fantastic improbability. And if our best juvenile literature is thus open to criticism, what is to be said of the worst? In the morality of our youth rest our hopes for the nation.

## SCIENCE AND MECHANICS.

**The Human Voice on the Wings of Electricity.**—Franklin when bottling the electric fluid little dreamed that it was so soon to be made one of the greatest agents in modern times to draw the extremes of the world together; and Morse, though he utilized the idea caught up by Franklin, could see but faintly where his wonderful invention would lead to, and no doubt never thought that the time was so near when *sound* would travel, not only as *signs* of letters, but the *actual human voice* would travel on the lightning's wings. Marvelous indeed are the results of human ingenuity and power. In the little toy so familiar to the school-boy, connecting with a single cord or string, to mouth or ear tubes of funnel shape, was the principle or germ out of which the scientific minds of the age were to bring wonders scarcely less strange, and perhaps none the less of utilitarian value than the Magnetic Telegraph itself.

The Telephone enables us not only "to take the wings of the morning" and soar abroad, but it allows us to remain where fancy or interest suggests, and from such chosen location it permits us to converse with those distant from us, on business, love or matrimony. Nay, more, it affords us all the delights and charms of music though the heart and head, or hand and key be located in the remote city or hamlet. The magic touch, and what at periods appears to be methodical frenzy, when the soul is inspired, while at the far-off piano, are transmitted with all their enrapturing sweetness and power. "Home, Sweet Home," and other favorite words are made to echo and re-echo as it were across hill, mountain and stream. Who can measure man's achievements?

In the good quiet city of Philadelphia, we have recently

had an exhibition of the Telephone, and from the following interesting report, we extract the following:

"Philadelphia began by working the keys for New York to hear. Now New York has its turn at the silent end of the line, and Professor Boscovitz played recently in metropolis for an audience in the Academy to hear. Professor Elisha Gray was introduced by Professor Barker, of the University of Pennsylvania, and, after a few words of introduction, the receiving instrument was raised and placed upon the piano. It appeared to be nothing but six wooden boxes, of different lengths, open at the ends, diminishing from the extremes toward the centre, set up in a row and connected by a wooden strip running through their middles. To this two telegraph wires passing through the dressing-room were attached. A battery placed in the little room at the left of the stage, and a little operating table close to the side entrance sat Robinson, the manager of the Western Union Telegraph Company, who was to act as prompter to tell Mr. Barker when to play.

Everything was soon in readiness; Professor Gray touched his head, and a little ticking was heard all over the hall. Intensely quiet were the audience, and at once the clear notes of 'Home, Sweet Home' were heard. The sound was unquestionably a surprise to the audience; it was so sweet as well as distinct, and loud enough to be heard in the corridor with the doors closed. The sound of the low notes was very much like that of a oboe or a bassoon, as sweet and almost as loud. Above a certain point in the middle of the staff the notes sounded like those of a violin.

heard in the distance. The reason for this was the incapacity of the instrument, which has only sixteen boxes while the sounding key-board has twenty-five notes. A number of airs were played, and all rendered with remarkable success. It was especially noticeable that in the whole performance only three or four notes were skipped. The tone was very vibratory, and yet one note ceased entirely as soon as the next note was struck, and the sound in finishing was as if a muffer had been put upon a piano-string. After a popular medley had been played with so much expression that the presence of a skilled pianist at the other end of the line was plainly manifest, Professor Gray announced that they would for the first time attempt to send harmony, to play a two-part tune. 'Home, Sweet Home,' was attempted, and it came over perfectly until a dozen bars had been played and then some reckless operator cut in on the wire and the effect was like that of a child thrumming the keys of a piano. The feasibility of the transmission of music as written was clearly shown. All that is necessary for the transmission of a Beethoven sonata is a sounding-board large enough to match the piano.

The rest of the concert, though of course less interesting,

was well received. Miss Thursby, who is unquestionably the best concert singer in America, was compelled to respond to encores. Signor Tagliapietra's fine voice elicited warm applause, and Mr. Liebling showed himself to be a pianist of much promise and no small attainment."

**Tyrian Purple Ink for Marking Linen.**—Von Bele gives the following method for preparing an ink for marking linen and cotton: Neutralize 75 grains of carbonate of ammonia with pure nitric acid, and triturate 45 to 60 grains of carmine with the solution. Mordant the fabric with a mixed solution of acetate of alumina and tin salt, and write upon it, when it is perfectly dry, with the ink.

**Caffeone.**—Caffeone, the aromatic principle of coffee, may be isolated by distilling 5 or 6 lbs. roasted coffee with water, agitating the aqueous distillate with ether, and afterwards evaporating the ether. It is a brown oil, heavier than water, in which it is only very slightly soluble. An almost imponderable quantity of this essential oil will suffice to aromatize a gallon of water.

## OBITUARY.

**Dr. William Augustus Muhlenberg.**—Only now and then can it be truthfully said, "his departure leaves a void not easily filled," as one by one is claimed by the steady reaper, Death. The birth, growth, education, lives lived, and exits from the world of the many, alas! too many, scarcely make a ripple on the great sea of life. Some men come and go unnoticed and uncared for, making no impression either for good or evil, merely adding to and detracting from the population a simple, almost abstract unit. Others proclaim their presence and stamp characters on society in both its limited and broadest sense—make their influence felt far and near. Of this latter there are two classes: one that makes the world wiser and better and life sweeter and happier; the other class adds to the strongholds of Satan. Both possess character, but each is diametrically opposed to the other. That girdles the loins and puts on the breastplate of truth and righteousness; this, the shield and defence of the impure and ungodly.

Therefore, though mingled with sadness, it is a pleasure to note the "golden sheaf" fully ripened by deeds of worth, as it passes from life, through death, to a brighter existence beyond the vale. Such can be said of Dr. William Augustus Muhlenberg, recently deceased. He had enjoyed the promise of more than man's allotment of time, even four-score of years, in a life of general activity, peace, charity and usefulness. As his life was replete with what will serve as safe finger-boards to other sojourners, we are sure able pens will give them, ere long, to the public. To this, our slight tribute to his memory, we add the following brief from the *Philadelphia Press*:

There is little of a stirring nature to be told of Dr. Muhlenberg's life beyond the few simple points already noted by the obituary writer, but his history, simple as it is, leads us back to reminiscences of that fine old Pennsylvania family of which he was, for years before his death, the most continuous living representative. We shall nowhere find a

better example of the cultivated German Lutheran of Pennsylvania than in the family of that Henry Melchior Muhlenberg who came out here from Saxony, in 1741, as a missionary of the Lutheran Church, and founded its first synod in America. He settled at the Trappe, in Montgomery County, where two at least of his three sons were born, three sons of whom any father and any State might be proud. They were all cultivated men and followed their father into the sacred ministry; they were all men of affairs as well. John Peter Gabriel was the fighting parson of whom we have all learned at school, who, when he had finished his sermon, threw off his gown and, appearing in his Continental uniform, called for recruits from his congregation. He became a major-general, and after the war a Representative and Senator in Congress, and Collector of the port of Philadelphia. Frederick Augustus preached in New York till the British entered there, when he came home and was sent to Congress. He was President of the Council, State Treasurer, President of the Convention that ratified the Constitution of the United States, member of Congress for eight years and Speaker of the First and Third Congresses under the Constitution. The third brother, Gotthilf Henry Ernst, was the botanist, whose herbarium the Philosophical Society has. He preached in Lancaster and dealt but lightly in politics; but his son, Henry Augustus, preacher and Congressman, Van Buren's Minister to Vienna, who so narrowly escaped being Governor, made up for his father's omission. Frederick Augustus' son, Henry Muhlenberg, was the father of this William Augustus, who was born in Philadelphia in 1796, while his grandfather and his two great-uncles were still in active life and his cousin Henry was at school. It will be seen that he came of good stock and had a good start in life.

Though all may not have such a satisfactory start in life as Dr. Muhlenberg, any one can see the marvelous results accomplished by persistent effort in the path of duty, to make the world better by having lived in it.

## GOSSIP AND NOTE BOOK.

**The Social Element.**—In this day of railroad, steamboat, telegraphic, and we might almost add telephonic communication, when time and space, if not annihilated, at least are spanned; when men and women are rushing into the general whirlpool of excitement incident to business and fashion; when self-interest and love of display absorb such a large portion of time and talent, it is well to pause now and then, not merely for rest, but for actual recuperation of both mind and body. The real charms and beauties of life are too often ignored, if not entirely lost sight of, in this general bustle and strife for money and display. The billows of fashion toss not a few on the breakers, and wreck thousands annually, of what were once noble crafts. So on the shores of life's sea are seen fragments of wild ambition and schemes for the coveted prize—FORTUNE.

This unnatural strain upon the mental and physical powers can be productive of no permanent good, but on the other hand, its direct tendency is to blight the highest and best capabilities of both. Just in proportion as we depart from our normal condition through unnatural excitements, are we hurled back to and not seldom beyond the starting-point by the repulsive laws of nature. The present depression in business, the reduced rates of freight, the drug of real estate in the market, the low prices of cotton and woolen fabrics, and indeed the general stagnation of capital and labor, are only the legitimate fruits of this abnormal strain.

The real success of life is not measured by great accumulations, nor by the reaching of the pinnacle of fashion and power. It is rather gauged by the amount of true happiness it brings us. This cannot be secured without a uniform exercise and symmetrical development of all our faculties and functions. We must have our seasons of quietude, as well as days of tumult; our moments of sunshine, as well as our hours of gloom.

These thoughts suggest one of the chief elements which goes toward making life harmonious; it is THE SOCIAL ELEMENT. The highest form of enjoyment in this life is that which comes from a cultivation of our social propensities. Examined either philosophically or practically we are forced to conclude that the social element is the source of more real felicity in its superlative aspects than all others taken together. The desire for society is in itself freed from selfishness—having in view generally the happiness of others as much as ourselves. To say that it is a natural principle and emanates from God, would only be to assert a *primary* truth; for we notice that children manifest a love for society in their earliest years; their eyes, smiles and animated gestures tell this too strongly to doubt. In youth, middle and more matured life the power of this principle, while exhibited more in the realms of thought, is unceasingly active. Still it is not dependent upon education, culture, nor even civilization itself. Where do we find the social principle showing itself more prominently than among groups of wandering gypsies, than in the tents of stern and restless Arabs, in the wigwags and hunting parties of American

savages, or in the cheerless abodes of the poor and desolate Esquimaux?

The American people need to cultivate this element more, to more frequently lay aside the day-book and ledger of the counting-room and office for friend-greetings and home welcomes. Too many hours are consumed in making calculations on the rise of stock, and the probable advance in dry goods, hardware, cotton and wool, and too few in fostering the social principle at home and among friends. We can make home more beautiful and existence brighter by exercising all our gifts in more equal and rational degrees. *More!* we can purify the moral atmosphere, and lift up on a higher plane those among whom Providence has placed us. One of the causes of the existing "Social Evil" is the alienation of so many from home. Too seldom do we concern ourselves or become interested in the amenities of home-life—the place of dwelling too often is a place only to lodge. To gain true success is to gain it all around, at home as well as in the marts of business. We enrich ourselves only as we enrich those committed to our sacred keeping; only as we illuminate by our words and deeds those with whom we mingle. Cowper promulgated in poetical beauty a great philosophical truth, when he said:

"Man in society is like a flower  
Blown in his native bed; 'tis there alone  
His faculties, expanded in full bloom,  
Shine out; there only, reach their proper use."

May we not hope that the readers and friends of THE AMERICAN MONTHLY will keep in mind that a profitable subject for their conversational powers is "the Social Element," and how best to improve it.

There is a certain admiral in this proud and happy country who has three daughters of somewhat uncertain age. The *midt* at the port therefore amusingly styled them "X, Y, Z." "Why do you call 'em that?" asked I, with ingenuous simplicity. "Because," answered an admirable youth, "they are the three unknown quantities, for deuce a bit can we find out how old they are."

**Curious Trees.**—Just beyond the Darbonne or Calcasieu River, in the parish of Calcasien, says the *Opeche Journal*, is a white oak tree about two and a half feet in diameter. There are no branches for twenty-five or thirty feet up. About twelve or fifteen feet up a pine limb, a part of a pine tree, six or eight inches in diameter and twelve or sixteen feet long, runs at right angles through the center of the tree, sticking out about the same distance on each side. It tapers a little at one end, where there are three knots, giving it the appearance of a limb or tree. The oak, where it passes, is grown closely around it. The pine is rich in turpentine, and will not decay. There is a fork or hollow in the oak; but it has the appearance as if a hole had been made and the pine stuck through, after which the oak closed on it by growth. The question is how did the pine get through the oak, or the oak around the pine?

**King Birds of Paradise.**—The principal occupation of the inhabitants of Arru is the hunting of the great King Birds of Paradise. The woods are filled with flocks of these birds, and the natives are quite cunning in their

ard has a most magnificent plume of feathers, of a yellow color, coming up from under the wings, and over the back like a jet of water. The breast is a emerald green and the body a beautiful yellow. about the size of a small pigeon, and have a voice unlike the jackdaw—in fact, they are allied to the They are restless, peculiar birds, and fly about ehies of great trees. natives have a peculiar way of killing them. They into the boughs of a tree which the birds are frequent, and, collecting a number of branches, conceal themselves so they can scarcely be seen; then a flock comes, they pick off the birds with their blunt heads. These arrows are of course quite The bird is simply paralyzed and falls, and in the natives sometimes get a large number of

minister was telling a young girl, who was about to a bride, that she must remember that the man and one. "Well," she said, "if you were under my mother's window when they are quarreling, you'd be at least a dozen."

**Up Against Him.**—The following good story is of the late Emperor Napoleon: A Frenchman having a country with distinction in the army, found to his that he was always regaled with the knuckle ends of st. If there was a bad post to be filled anywhere, it who obtained it; if there was a disagreeable expedition, he was ordered off on it as sure as certainty. One year he had an opportunity of seeing the Emperor while the latter was on a visit to Algeria, and then he said: "I'm afraid, sire, some one of your clerks has been up against me." "Not at all," answered the Emperor. "I have heard of your case, and it appears that you are not a bad officer, you once took part in a political manifestation, and a bad mark has been set on your name in consequence." The officer collected his wits for a moment, then struck his forehead and said: "Why, sire," said he, "shall I tell you what was the serious manifestation in which I joined? It was the day when you headed when you landed at Boulogne, under Philippe's reign." The Emperor laughed too, but not at all; and the officer, of course, found promotion work enough from that date. But if it had not been for the introduction to Napoleon, he would have suffered life for having served his master not wisely but too

following is a true copy of a letter received by a schoolmaster: "Sir, as you are a man of noleage, I to inter my son in your skull."

**Cheerfulness.**—Let your cheerfulness be felt for good wherever you are, and let your smiles be scattered like sunbeams "on the just as well as on the unjust." Such a disposition will yield a rich reward, for its happy effects will come home to you and brighten your moments of thought. Cheerfulness makes the mind clear, gives tone to thought, adds grace and beauty to the countenance. Joubert says: "When you give, give with joy, smiling." Smiles are little things, cheap articles to be fraught with so many blessings, both to the giver and the receiver—pleasant little ripples to watch as we stand on the shore of everyday life. These are the higher and better responses of nature to the emotion of the soul. Let the children have the benefit of them—those little ones who need the sunshine of the heart to educate them, and would find a level for their buoyant nature in the cheerful, loving faces of those who need them. Let them not be kept from the middle-aged, who need the encouragement they bring. Give your smiles also to the aged. They come to them like the quiet rain of summer, making fresh and verdant the long, weary path of life. They look for them from you, who are rejoicing in the fullness of life.

If your seat is hard to sit upon, stand up. If a rock rises up before you, roll it away, or climb over it. If you want money, earn it. It takes longer to skin an elephant than a mouse, but the skin is worth something. If you want confidence, prove yourself worthy of it. Do not be content with doing what another has done—surpass it. Deserve success, and it will come. The boy was not born a man. The sun does not rise like a rocket, or go down like a bullet fired from a gun; slowly and surely it makes its round, and never tires. It is as easy to be a lead-horse as a wheel-horse. If the job be long, the pay will be greater; if the task be hard, the more competent you must be to do it.

**Difference—buy, instead of bye.**—A gentleman speaking of his wife to a friend said: "Before we were married, she used to say 'bye-bye' so sweetly when I went down the steps." "And now what does she say?" asked the friend. "Oh just the same," exclaimed the man, "buy, buy!" "Ah! I see," said the other, "she only exercises a little different 'spell' over you."

**Objects in Life.**—The well-educated girl is not in a wild hurry to get married, because she has objects in life which call forth her natural energies. Hasty marriages are often unsatisfactory, and as many women cannot be married because of their excess in numbers, we should try to render the unmarried life less objectless. As it regards the married state, a man of sense and personal cultivation will be generally all the happier for having a wife who has intellectual sympathy with him. In effect, such a woman may become a better wife and mother than otherwise she would be. Even in the matter of accomplishments, there can be no doubt that girls would play, sing, draw and paint better if their general intelligence was trained by better study.

**Angels Scared.**—A little Chicago four-year-old created a ripple by remarking to the teacher of her Sunday-school class: "Our dog's dead. I bet the angels was scared when they saw him coming up the walk. He is cross to strangers."

**Grown-up Children.**—Nothing appears to us so beautiful in human experience as the reciprocal affection of parents and children, especially after the latter have attained maturity, and, it may be, formed new relations in life. We have seen the loving and lovely daughter, after she had become a wife and mother, seize every opportunity of visiting the parental home, to lavish her affectionate attention upon her parents, and, by a thousand graceful and tender kindnesses, assure them that though she was an idolized wife and a happy mother, her heart still clung with every strengthening fervor to father and mother, who watched over her infancy and guided her youth. It has been our privilege to know such; and as we have witnessed the outpourings of love and happiness between these devoted and glowing hearts, we have felt that surely much of heaven might be enjoyed here if all families were equally attached. And would that every daughter knew what pure joy she might create in the parental bosom by a constant keeping alive of the spirit of filial devotion, and seizing frequent opportunities to make it manifest in little acts of gentleness and love, notwithstanding the child may have become a parent. The child never grows old to a fond parent. It is always the dear child, and never so dear as when it keeps up the childish confidence and love of its earliest years.

**Surprise** is the essence of wit; but, somehow, when a man is climbing down a ladder in a hurry and never finds out that one of the rungs is gone until he tries to step on it, it never seems very funny to him.

**Kind Words—Why use them?**—1. Because they always cheer him to whom they are addressed. They soothe him if he is wretched; they comfort him if he is sad. They keep him out of the slough of despond, or help him out if he happens to be in.

2. There are words enough of the opposite kind flying about in all directions—sour words, cross words, fretful words, insulting words, overbearing words, irritating words. Now, let kind words have a chance to get abroad, since so many and so different are on the wing.

3. Kind words bless him that uses them. A sweet sound on the tongue tends to make the heart mellow. Kind words react upon the kind feelings which prompted them, and make them more kind. They add fresh fuel to the fire of benevolent emotion in the soul.

4. Kind words beget kind feelings toward him that loves to use them. People love to see the face and hear the voice of such a man.

**Lavender** was aroused in the middle of the night by his wife, who complained that she heard a noise. "What does it sound like?" said he. "It sounds like something ticking," said she. "It's probably the bed-ticking," he murmured, and went off to sleep again.

**Modern Chivalry.**—The Crown Prince of Prussia has recently acquired considerable *réputation* by an unstudied, yet effective, assumption of the *rôle* of Sir Walter Raleigh in the famous cloak scene with Queen Elizabeth. It seems that he and his little wife, the English Princess, were

unduly late in their arrival at the gala dinner given to the King and Queen of Saxony during their recent visit to the Prussian Court, and, through some misunderstanding, the carpet leading from the carriage-way to the castle door had been removed by the servants. It was a wet, disagreeable day, the pavement was sloppy, and the little Princess was in full dress, with voluminous train, and feet shod in slippers. With an impulse of chivalry, worthy of the sixteenth century, the Prince threw off his wrap and spread it on the walk for the Queen—no, the Princess—to tread upon. She, poor little practical body, spoiled the poetry of the incident by a base-born instinct of economy, and entreated the Prince not to profane his garment by contact with the mire and conversion into a carpet. But the brave Prince was true to the demands of the situation, and gallantly conducted his wife in safety over the bridge he had improvised.

It is a pretty little incident, and a great improvement upon the original. The affair of Sir Walter has been cited as the most exquisite example of chivalry in all history. But the shrewd courtier laid down his cloak at the feet of an imperious Queen, who taught her attendants that flattery and servile attention were the price of her gracious smiles. The Crown Prince spread his wrap before his wife from a genuine motive of respect and affection. How much more proud she had a right to be, walking over it, than Elizabeth had, who trod the same sort of tapestry three centuries ago!

**Are blacksmiths who make a living by forging, or carpenters who do a little counterfeiting, any worse than men who sell iron and steal for a living?**

"I don't see how you can have been working all day like a horse," exclaimed the wife of a lawyer, her husband having declared he had been thus working. "Well, my dear," he replied, "I've been drawing a conveyance all day, anyhow."

**The world** is a looking-glass, and gives back to every man the reflection of his own face. Frown on it, and it will in turn look surly upon you; laugh at it, and with it, and it is a jolly, kind companion.

**The great English gun** is pronounced cracked, the reason being that it was not thoroughly bored. If it had been placed in an American newspaper office the result must have been very different.

**Josh Billings** says: "The muwl is a larger bird than the guse or turkey. It has two legs to walk with, and two more to kick with, and wears its wings on the side of its head."

**Jeffries.**—Judge Jeffries, of notorious memory, pointing to a man with his cane, who was about to be tried, said, "There is a great rogue at the end of my cane." The man to whom he pointed, looking at him, said, "Which end, my lord?"

**Homeless.**—All men are not homeless, but some men are home less than others.

# POTTER'S AMERICAN MONTHLY.

PL. IX.

JULY, 1877.

No. 67.

## CIVIC AND SCENIC NEW ENGLAND.—NEWPORT IN 1877.

By ORAMEL S. SENTER.

REDWOOD LIBRARY, NEWPORT, RHODE ISLAND.

last year Philadelphia was the grand watering-place of America. Once, for a wonder, all the pleasures of pleasure travel terminated at one point, namely: Fairmount Park and the great Centennial Exhibition.

The American people not only devoted themselves to the rare sight-seeing thus offered, and to celebrating our country's first great anniversary, but also entertaining the nation's guests from abroad. Assembled in grand convocation at Philadelphia, and gave a six months' reception to the representatives of all lands, the people of "the City of Brotherly Love" officiating as chief ushers upon the august occasion. During the month of March till December, the latter acted

the part of *host*. This year, however, they intend to play the rôle of *guest*. They are impatient, "spoiling," as the phrase goes, for their customary relaxation and pleasure travel.

Something of the same feeling, and for the same general reason, pervades the whole country. Hence we predict a prosperous season, this year, where there are desirable summer resorts, so far as the finances of the country will admit. As to this, there are a great many persons who have money invested, or otherwise laid by, where they can conveniently put their hands upon it; and the hot weather will cause them to count over the "pile" and draw out a portion for pleasure or travel.

Just here the important question arises with such, "Where shall I go? How shall I contrive to derive the most pleasure, and add most largely to my health-fund and stock of information, for the time set apart and money expended?"

Already not a few Philadelphians have declared their choice for 1877, by building or renting cottages at that world-renowned watering-place, NEWPORT. Others will doubtless engage quarters here for a part or all of the season, at the hotels or some of the numerous and extensive boarding-houses. A great many more, we are persuaded, would do so, if fully and correctly informed respecting the merits of this superb watering-place, suited as it is to all tastes and seasons, especially hot and sultry weather, when many other places, including Saratoga, are almost intolerable from the excessive heat. And we here remark, what we have often had occasion to know, that the people of Pennsylvania and New York are almost universally well pleased with the trial of the best watering-places of New England. They like the scenery, the fare, the intelligent and courteous attention received, and generally the prices asked.

At 11.30 A.M. we take the cars from Philadelphia at the North Pennsylvania depot, at Berks and American streets, bound for Newport *via* New York and the Fall River Line of steamers over Long Island Sound. The North Pennsylvania Railroad is an old acquaintance; but their New York route is comparatively a new one, and we make the distance through for the first time.

We always had a penchant for new routes and places from boyhood, and in this instance we not only enjoyed the novelty of this new and already favorite route, but found the running of the cars and the accommodations all that could be expected of the oldest and best railroads in the country. The road bed is remarkably straight (having fourteen miles of air line in one place), even, well ballasted, and being equipped with the best of cars, the Westinghouse air-brake, and experienced and obliging conductors; the motion, the speed, and the management of the trains are in all respects excellent, and we highly enjoyed this part of our trip, though so near home. One great advantage of this route, and one which the travelling public will know how to appreciate is, that being through a fertile and highly cultivated section of country, and the portion situated in New Jersey being just north and west of

the dry plain section, it is almost wholly free from dust and sand. It is also delightful to run through a region of such fertility in the season of foliage and crops, and to note the rise and growth of the neat and prosperous towns that sit by the road, some of which, like Jonah's gourd, seem to have grown in a night.

The last thirty miles of the route is occupied largely by the homes of New Yorkers and those doing business in the metropolis. In fact, it looks very much as though the Gothamites were determined to take possession of New Jersey. They have not only spread themselves along the lines of her railroads, but like other freebooters, they have coasted along her shores and taken possession of nearly all the desirable places, from Sandy Hook to far beyond Long Branch. Evidently they are striking for Atlantic City, and possibly Cape May. But as the Pennamites are already in those places in great force, this fact "may give them pause" and thus save the people of the "Garden State" and "land of aquatic sports and privileges" from being wholly overrun and absorbed by these ambitious and enterprising New Yorkers. One thing is certain, that both Gothamites and Pennamites should cease to sneer at New Jersey, or gracefully withdraw at once and forever from her borders.

In two hours and a quarter by the real time and ten minutes less by the card which we take with New York and Philadelphia time on it, after leaving the Berks street depot, we are landed and sound in the "Babel" of trade and commerce now remarkably quiet, from the condition of business over the whole country. We should like to explain, that the "New Route" to New York, under the control of the North Pennsylvania Railroad, is made up of three parts: a branch of its own road proper, to the Delaware River; the Bound Brook Railroad from there to Bound Brook, on the Central New Jersey; and over the track of the latter company to New York. The whole distance—which, it is claimed, is the shortest route by some two or three miles—is just eight and four-tenths miles. The passengers are landed at Liberty street, which is near Pier 1, where the Fall River boats start, the 1.30 Philadelphia train being in season for all lines.

At 5 o'clock P.M. precisely, we go on board the steamer Bristol, one of the noble boats of the Fall River Line. The immense size and magnificent finish of these boats fill one with admiration and

a feeling bordering upon awe, and we never cease to admire them. We have often noticed the im-

looks. All this and more passes through the mind before one is fairly ensconced in one of the richly

THE STEAMER BRISTOL.

pression made upon strangers, when they first enter the spacious and richly finished and furnished saloons, and the mingled expressions of surprise and admiration that escape in their words and

cushioned seats. But look! The moorings are unfastened, and we are moving slowly and majestically out from pier No. 28 North River. We like to watch the starting, and note the change

in the points of the compass, so as to have the course of the ship and every scene and object rightly associated in the mind. Now we double the southern point of the great City, and pass Castle Garden, a place crowded with associations and memories good and bad, pleasing and repulsive. Here, in our boyhood days, we heard the "Swedish Nightingale" trill her sweet songs and echoes. Quite different these strains from the confused jargon of the swarms of emigrants that here land and disperse over the country of their adoption! The lawns and walks bordering the shore and stretching along towards East River are fine, and greatly relieve the view. But here we come to the famous Wire-bridge, between New York and Brooklyn, which we have heard so much talked about for the last ten years, and of which the accompanying picture is a graphic representation. This bridge was begun some five years ago, and was to have been completed this year (1877), but will probably require an extension of time. Its extreme length is six thousand feet, or considerably over one mile. The road-bed is to be eighty-five feet wide, divided into a broad foot-way, two railroad tracks and four carriage and horse-car roads. The cables are sixteen inches in diameter, and combined will be strong enough to sustain a weight of five thousand tons—much more than will ever be required of them. The entire cost is estimated at \$10,000,000.

Is this Hurl Gate, in plain English, Hell Gate, we are now approaching! once the terror of mariners, and the ghost that haunted them on dark nights and foggy days? So they say. But the channel is so much deeper and smoother than it was before the patient labors and scientific skill of General Newton widened and lowered it, that we could hardly identify the spot. Yet we hear certain croakers and old fogies declare that it is no better than before. Such persons we presume, could prove to their own satisfaction, that twenty feet of water is no better than ten, and a smooth channel no safer than a rocky, jagged whirlpool.

All along our route up East River beautiful islands lie on either hand, seeming to rest on the bosom of the river as the child reposes in the arms of its mother. Fertile, highly cultivated and clothed with the richest verdure, they are set in the water like gems in a crown. They in fact seem more like fairy lands than the abodes of men.

But we notice large edifices and groups of build-

ings, and see here and there squads of men in strange garments—and we are told that establishments are mostly the reformatory institutions of the City and State of New York. One would suppose that, surrounded by such scenes, it would tend to make men better. But it seems to have this effect.

Our surprise may be somewhat modified when we remember that it was amid the most beautiful scenes of the natural world, where our first fathers were embowered in the ambrosial fields and the radiant beauties of Paradise, that the first crimes were committed, so pregnant with fearful consequences, that "All nature groaned and her centre shook."

No! innocence and moral beauty spring up within, though they are greatly refined and purified by the fair scenes of the outer world.

A few minutes ago we were speaking of the splendid steamer on which we are making this pleasant and most enjoyable trip, with many passengers on board apparently just as highly pleased and happy, when our attention was diverted to the noble boat, and its fair consort, the Providence, more in accordance with their merits.

We shall speak particularly of the Bristol boat we are on, and which seems to be the favorite with the travelling public, although we may say will apply to the Providence, almost precisely like it, and intended to respect its equal.

The Bristol is three hundred and seventy feet in length, eighty-three feet beam, and has sixteen feet depth of hold. The capacity of its hull is three thousand tons, and the engine is equal to two thousand eight hundred horse power.

The next largest steamer afloat on the Sound, so far as we know, is the Massachusetts. It is three hundred and forty-four feet, beam, eighty feet, with the same depth of hold and horse power as the Bristol and Providence. This boat belongs to the Boston and New York line *via* Providence. The height of the superstructure or distance from the hold to the uppermost deck exceeds any vessel we have ever seen. It has three decks and tiers of state-rooms, all fully pleasant and finely finished and furnished. The berths of the hold are equal to the stowage of the average steamer. There is a fine

loos on the first or main deck, exclusively for  
 dies and children. The principal saloon is of

the Providence. The massive richness of its solid  
 mahogany finish, the happy blending of colors,  
 the tasteful selection and  
 disposal of the furniture,  
 are best seen from certain  
 points in the grand saloon,  
 as given in the engraving.

But the magnitude of these  
 truly "floating palaces,"  
 and the order and taste dis-  
 played in all their arrange-  
 ments and ornamentation  
 are best taken in at a single  
 glance from the galleries  
 of the upper decks. As  
 the eye sweeps downward,  
 athwart the lofty and mas-  
 sive pillars, and along the  
 halls of the immense saloons,  
 displaying vast areas of com-  
 fort and tasteful, luxurious  
 adornment, made animate  
 with groups and parties of  
 the young and gay here and  
 there, and throngs of people  
 of all ages moving back and  
 forth, seemingly full of life  
 and happiness, the scene is  
 highly picturesque, impres-  
 sive and even grand. The  
 cost of both the Bristol and  
 Providence was \$1,250,000  
 each. They do not, how-  
 ever, stand to the Fall River  
 Railroad Company at this  
 sum, having been sold while  
 in course of construction,  
 and passed through the  
 hands of several parties  
 before they were purchased  
 by their present owners.  
 They in fact have quite a  
 history, and it may interest  
 the curious to know that  
 they were at one time in  
 the ownership of Fisk &  
 Gould, who, we believe, also

INTERIOR OF STEAMER PROVIDENCE

course on the second deck, and for size, richness  
 and taste in the finish, elegance and costliness of  
 furniture and an air of luxury and comfort, we  
 have never seen its equal, excepting its consort,

had a controlling interest in the stock of the Fall  
 River Railroad Company for a short time. They  
 were built about ten years since, and in the most  
 complete and thorough manner. Not a seam or

defective timber can be found in them; and to insure the preservation of these "noblest craft that float the sea," and especially the safety of the countless passengers who intrust themselves to their comfortable quarters and staunch sea-going qualities, they are carefully overhauled at least once a year from the keel to the pilot-house.

An excellent feature of these boats is, that the meals are served on the European plan. But the most noticeable characteristic, and one which we have often observed with silent admiration, is the quiet, almost noiseless manner in which the commands—we might call them *directions*—of the officers are given, the perfect order that prevails, and the ease and despatch with which everything is done. It reminds one not inaptly of the silent but effective operations of the forces of nature.

We always part with these boats with reluctance, for the average hotel compares with them for taste and comfort about as a common farm-house would compare with the palace of Queen Victoria. They are happily the only direct conveyance from New York to Newport. But even in going to Boston, or any point in Eastern New England, these steamers, with their connecting lines of boats and railways, are the best possible means of conveyance; and the person who is on a pleasure trip during the hot season, that should take the all-land route and endure the dust and sweltering heat of the cars, might be regarded as verging upon insanity, or lamentably ignorant of the best modes and routes of travel.

It was a little past two o'clock in the night when the Bristol reached Newport. Compelled, therefore, to defer our inspection of the town till daylight, we were under the necessity of seeking a second night's lodging, or rather of providing for the last half of a night badly split in two—as a native Pennsylvanian would express it, "split in half." This we succeeded in finding at the Perry House, one of two hotels only that are open the year round. We always like first of all to get the outlines of a place, its general figure and physical characteristics, from some hill, tower, or other high point; and when convenient, from several points. From the observatory of the Perry House we make our first survey. Here the prospect is a mild one, but affords a fine birds-eye view of the harbor and of the town, particularly the older portion, situated on the southern and southwestern slope of the island.

Subsequently we enlarge our view and knowledge of the place by observations from other points. Among the very best that we found was that from the observatory of the Ocean House. Its location is one of the highest in town; the building itself, counting the observatory, being six stories high, it affords a most extensive view entirely unobstructed in every direction. From this lofty eyrie, the vision sweeping every part of the horizon, you can take in the town, all the south end of the island and a large portion of Narraganset Bay, with its islets, bays and countless headlands, and beyond all these, a wide stretch of rolling, varied and picturesque mainland, clothed in the verdure and beauty of summer. As we cast our eyes over this matchless landscape, combining the choicest effects of land and water, and for the vision upon the charming scenes, we can hardly describe our varying, kindling emotions and the transports of delight that thrill the soul as we gaze again and again at the magnificent panorama, first at one part and then at another, till the whole emotional nature is filled to overflowing! We seem to have seen this lovely scene before, at least in some dream or vision of mind.

Anon, busy thought runs swiftly back over the multiform events of the past, memory dives into the rich treasures of local history and tradition, and with its teeming reminiscences brings before the mind events of by-gone days vividly before the mind veiled and transformed with a halo of beauty and indescribable charms, through the lapse of time.

Of these historic incidents that come crowded upon the mind, and people this renowned scene with the actors of two centuries, we can only mention a few, such as first come to the surface and claim utterance. But first we will say a word respecting the topography of the island and bay on which Newport is located.

It has often been a question whether Rhode Island contains Narraganset Bay, or the Bay contains the State. Certain it is, that within the borders of this beautiful sheet of water, are some of the finest portions of this proud little State, which, though small in territory—numbering but a little more than eleven hundred square miles—has no reason to be ashamed of the record she has made on the scroll of fame or in the annals of her country. The Bay itself is about thirty miles long from north to south, by fifteen in width. It

shores are indented with numerous delightful bays and headlands, and the main body of water studded with gems of islands, the smaller of which do not appear on the maps. Among the most fertile and beautiful of these, and the largest of the group, is Rhode Island, on the south end of which Newport is located. It is about sixteen miles long from north to south, by from two to four in width, containing an area of about fifty square miles. Its entire circuit, following the

On the southern slope of this island, rising to a height of two or three hundred feet in places and descending gently to the east and west, Newport is located. The surface also falls away slightly towards the north. Its situation is thus open and airy, entirely self-draining, and affords everywhere the most delightful sites for cottages. All the world knows how well this feature has been improved and taken advantage of. Probably it was this which originally suggested the whole cottage

BRIDGE BETWEEN NEW YORK AND BROOKLYN.

winding of the shore, cannot be less than sixty miles. The main figure of the island is that of an elevated ridge. Yet it greatly varies, and in places branches off into side ridges and valleys, or gently rolling elevations, affording a pleasing variety of surface, which in the season of fruit and foliage presents a landscape of rare beauty, and in places, especially along the ocean shore, the scenes rise to the picturesque. So fertile is the soil and so highly cultivated the lands of the island, it has been aptly termed "The Eden of America." It was originally called Aquidneck, an Indian name signifying "Isle of Peace;" but it was soon changed, by act of the Legislature, to that of Rhode Island, the name it now bears, which, as well as that of the State itself, is said to have been derived from the Isle of Rhodes in the Mediterranean, and belonging to Turkey.

system, the most striking characteristic of Newport. As one looks over these peaceful abodes and the quiet prosperous city in which they are located, and the beautiful island that stretches far away to the north—the very emblem of rural happiness and peace—he can hardly realize that this very spot has been the scene of the most stirring events and the bitterest strife of men; these fair, green hills and quiet vales once echoing the notes of war and din of battle, the placid bay with its peaceful isles taking up the refrain and sending the strange and discordant sounds across her perturbed bosom from point to point and shore to shore. But so it was, and in this connection we will give an item or two of history both warlike and peaceful.

During the War of Independence, yonder bay was covered with hostile or friendly fleets, and for

three years the town was in possession of the British, the troops, when the weather was inclement, being quartered upon the inhabitants, to the discomfort and destruction of domestic peace.

Within sight of where we stand, were some of the British forts that enclosed the town on the north. Miantonomi Hill, the picturesque eminence to the northwest, was fortified and formed a link in the chain of its defences. Along these General Sullivan, early in June, 1778, laid siege with the purpose of expelling the British from the island. But the French fleet failing to coöperate, he retired to the northern part of the island, where a severe battle was fought, July 29th, 1778, General Greene being present to aid, on account of his love for his native State. The British were repulsed with heavy loss, but the American commander learning that a large reinforcement for the enemy was at hand, crossed over to the mainland, and finally withdrew altogether, compelled to leave the inhabitants of this devoted town a while longer to the tender mercies of the enemy. For three long years—from 1776 to 1779—which must have seemed an age, the people of Newport were virtually prisoners in their own town, in the hands of a ruthless and insolent foe. They were insulted, their property destroyed, their homes invaded, and in short, every indignity and wrong that a spirit of almost fiendish cruelty could invent, was practiced upon them.

The chief instrument of their punishment was the infamous General Prescott, who was a disgrace to the British uniform and name. Narrow-minded, of violent temper, a bigoted royalist, and a tyrant by nature, cruel and unrelenting as fate, he would brook no slight, opposition, or even difference of opinion, and woe to such as incurred his displeasure! The people of Newport knew what this meant, for upon them a mysterious Providence permitted him to pour the vials of his wrath. The vandalism of the British soldiery, the tyranny and studied cruelty of Prescott, nearly destroyed the place. Their shade-trees were cut down, the churches turned into stables and riding-schools, and hundreds of their dwellings were destroyed. He even went so far as to tear up their side-walks and door-steps, to make a broad pavement and promenade for himself and fellow-officers. It must have been a strange and ludicrous sight to have seen the inhabitants, when the British evacuated the place, coming from all directions to claim and

restore their stolen paving-stones. The scene in Irving, where the different authors come to claim their productions that had been pirated, is tamely compared with it. As a parting blessing, these vandals who had so disgraced their calling and their country, burned numberless private dwellings, filled up the wells, attempted to blow up the Round Tower on the hill and badly damaged the wharves and landings, etc.

This Prescott is the same that shook his cane at the face of Ethan Allen, to whom the bluff hero of Ticonderoga offered back his own head as "the beetle of mortality," if he should dare to execute his threat.

He is the same worthy, too, whom Colonel William Barton captured, one dark night, at what now called the "Overton House," about five miles up the island. Barton came from Warwick Point, on the west shore, with four well-manned whale-boats, and his exploit, which was completely successful, was one of the most brilliant and daring achievements of the war.

Time heals or obliterates all things, even the dreadful scars of war. A hundred years have accomplished wonders, of which Newport is a striking proof. As we look at the fine mansions, compact rows of houses, and public edifices, especially as we view the magnificent shade-trees in their abundance, magnitude, and beauty, we can hardly conceive that they are mostly the growth of a hundred years, and that a town now so peaceful and prosperous was a century ago stripped and peeled and swept as with the besom of destruction.

Many events, some of them of thrilling interest, occurred on the island and places adjacent upon the mainland, during the Indian wars and in the second war with Great Britain, but all these we remit over to the historian and annalist, reserving our space for other things.

As one looks at this place and considers its fine location, its fame as a watering-place, and its solid wealth and prosperity, he desires to know something respecting the origin and growth of the town.

Newport was founded in 1639, by Governor William Coddington and seventeen associates. The date is often given as being 1638, the mistake occurring, we presume, from the fact that the same parties commenced a settlement that year, farther up the island, at a place now called Portsmouth.

The following year, as they explored the island,

and reached the south end, the beauty of the spot and its great natural advantages suggested the propriety of founding a town, and these enterprising men proceeded at once to carry out the idea. The place was laid out, and a good beginning made the first year. It grew rapidly, and soon Newport was known far and wide as a central point of the fishing interests, for its domestic and foreign commerce, and the trades and manufactures that naturally grew out of these. Her traffic was not only extensive, but very lucrative, and her commercial men and traders were the merchant princes of their time. Her exports and imports were second to no city on the continent, except Boston. Even New York was not her equal in this respect for years previous to the Revolutionary War.

But the war swept her ships from the sea, and with the destruction of her commerce her prestige went also. Other places arose to dispute the palm of the ocean, and Newport could never recover her trade and her position among our commercial cities. But the magnificent Narraganset Bay, stringing her little islets around the fair "Isle of Peace" like a necklace of pearls; the fine harbor, and the almost unlimited seashore, which had prompted her commercial enterprise, still remained, and no doubt suggested, as their commercial importance declined, the idea of making it, what Dr. Waterhouse predicted it would become, the great bathing establishment and seaside watering-place of the country. To what was then the great misfortune of Newport, the people of this country owe the possession of a summer resort in many respects the finest in the country, if not in the world. This town was incorporated as a city in 1784, and is one of the oldest in the country.

Even before the Revolution, Newport was noted for the number of persons of learning, leisure, and wealth, that congregated here from other parts of the land, and to some extent from Europe. For that day it was considered quite a famous seaside resort. But it was not till about 1830, long after the loss of her commerce and trade, and the almost total failure of every attempt to recover them, and the decline also of her large share in the fisheries, that she came into special note, and assumed her position as the leading seaside resort of the country. From that time onward her supremacy has been maintained, and she stands forth to-day as a bride robed in beautiful garments, first upon the Atlantic coast, if not the Queen of American watering-places.

Some of her numerous attractions—a few of the many solid advantages she has over most other watering-places—we shall attempt very briefly to give.

From the abundance, yea, almost superabundance of shade seen here, both on the avenues and around the private dwellings, one would almost imagine that either nature or the good people of the place had determined to be avenged on the vandals who once destroyed the pride and glory of the town.

Shrubby and flowers are also a marked feature of Newport. Landscape gardening has here done some of its best work, and clothed the rural portions of the town in garments of beauty.

It lacks, however, a grand Central Park, and we regard it as an oversight that one was not laid out at an early date. And yet, the whole place is gradually becoming one immense park, a rural garden of shaded avenues, embowered walks, and flower-crowned terraces. The largest of the public grounds that are shaded, is Touro Park. This is a small but attractive bit of lawn and shade, near the head of Bellevue Avenue, the chief promenade of the town, and the location of many of the best cottages. This park is important, for what it contains, rather than on its own account. Two objects immediately attract your attention as you pass through it. These are, the Round Tower, and the monument of Commodore Matthew C. Perry. The latter is a bronze statue, a little above life size, standing upon a granite pedestal. It represents him in his military cloak, leaning lightly and gracefully upon his sword, in an attitude of peace rather than war. This is appropriate; for the great act of his life, and the one for which alone he will be remembered by his countrymen and the world, was in opening the doors of Japan, that had been barred for long centuries to the commercial intercourse and progressive ideas of the nations of the West.

The results of this act, which will form a great landmark in the progress of the nations, were strikingly illustrated in the very interesting and creditable exhibit which the Japanese made at the grand Centennial and International Fair. That inquisitive and rising people now doubtless bless the day that Commodore Perry, in his flag-ship, the *Susquehanna*, followed by her consorts, with all the guns shotted, steamed majestically and gracefully into the harbor of Yeddo, and *persuaded* them, that is compelled them, at the can-

non's mouth, to open their doors to America and the world, never to close them again.

"Peace hath her victories as well as war."

The same tiny park (Touro), more than a thousand of which could be placed down in Fairmount, contains, as we have intimated, an interesting relic of the past, whether of colonial or more remote origin. Briefly described, it is a strong stone tower, twenty-five feet high by twenty-three in extreme diameter, with walls over three feet thick, and standing upon eight arches, that spring from and are supported by eight circular columns, which are three feet and a half in diameter and solid. The tower is built of stone gathered in the vicinity, and laid up with great skill, is covered entirely by an ancient woodbine, and once had a roof and floor, and was thirty feet high, until the top was blown off by the British.

A great deal of speculation, and not a little learned discussion, has been expended respecting the origin and uses of this unique and rather weird-looking structure. Lossing, the historian, is among the number who have entered largely into the controversy. He takes the ground that it is of great antiquity, and probably built by the Northmen, in some of their voyages of discovery to America. That they made such voyages, and touched upon our coast, in the ninth, tenth, and eleventh centuries, there is but little doubt. That they built this tower, or that it had any very remote origin, we think more than doubtful. We believe it highly probable, if not a positive certainty, that it was erected in colonial times.

(1.) Governor Benedict Arnold speaks of it in his will, made in 1678, as "My stone built wind-mill;" thus declaring, explicitly, what it was built and used for, in the serious and truthful language of a will. At such times, if ever, men use words in their true and exact meaning. It is also just the language he would use, whether built by himself, or some one from whom he may have purchased it.

(2.) That its origin and uses were what we have here assumed them to be, and that Governor Arnold himself built the structure, is rendered highly probable, from the fact that "stone-built windmills" almost precisely like it, are found in the same section of England from which he came; which would naturally suggest the building of this one.

(3.) Again, the niches in the wall for biers, the three windows, and the general of the structure, imply that it was built for a windmill. We learn that it had when the British occupied Newport, and was blown off by them with several feet of the top we have mentioned, when they evacuated the town. There was also a floor in it, in memory of the oldest inhabitants.

*The Northmen would not have much use for a windmill, for grinding grain, while on a discovery.*

(4.) Nor would voyagers of any kind stop to build a work so solid and permanent, and requiring so much time, for any much less for a baptistry, as Lossing suggests. For which use, by the way, it has not the adaptation; nor can we see why they should build such an institution at all under the circumstances.

(5.) And then, the site selected, the point on this part of the island, open and exposed to catch the breezes in all directions, speaks as to what it was intended for.

(6.) The entire absence of water-power on this island, steam not being then known, made windmills an absolute necessity. Lossing is right in this. But he lays great stress on the fact that Governor Easton, some fifteen years before Governor Arnold made his will, which, as we have seen, was made in 1678, built a *wood* wind-mill and received bounty for it; and that fact is mentioned in the will of the day. Well, Easton was a private citizen, it may be, comparatively poor, while Arnold was Governor, and doubtless a rich man, and would take pride in building a *better* mill than the one built *without* bounty. The fact that the Government voted a sum of money to Easton, would be a great incentive to his work and cause the annals to mention it. Besides, fifteen years in a new colony may make a vast difference in the value and importance of a thing. As to the mill and others in the colonies, being built of stone, the very language of Arnold implies this, with an exception, when he terms it "my stone windmill."

(7.) Respecting the arches, and the floor below, which have been objected to as not being in stone windmills; these, and the great open room, may have been intended for protection against Indians. The wide open room would also be very convenient

ing into in stormy weather, and for loading and unloading grain and flour at any time.

(8.) The mortar with which the stones are laid is not only very smooth and hard, almost as hard as the stones themselves, but in a state of excellent preservation, still looking comparatively fresh and clean. This can be accounted for on the supposition that it was originally of very excellent quality, and has been on only two hundred years, in a dry, open place. But allow for its existence nine or ten centuries, surrounded by a damp forest and the vapor of the sea, it is not at all probable, if possible, that it would be in that fresh and excellent state of preservation in which we find it. It would rather be covered with mildew and moss, and dimmed and blurred by dampness and the gnawing tooth of time, showing the effect and unmistakable signs of great age.

(9.) Finally, the entire absence in the annals of the day of all reference to this structure as then existing, and found here by the first settlers, it seems to us is conclusive against the position that it originated with the Indians, the Northmen, or with anybody but the settlers themselves; or than, as shown by the will of Governor Arnold, and the corroborating proof here given. Coddington and his associates, and many of the early settlers of Newport, were persons of great intelligence, and some of them highly learned men. It surpasses all belief that such men should find so wonderful a structure here, and remain utterly silent respecting it, and that silence remain unbroken till there would be no occasion to note it at all, except in the inquiries of the antiquarian!

As we leave Touro Park, with its monument and the old mysterious Tower, and pass up the head of Bellevue avenue to Touro street, we come to a Jewish cemetery, and a little further along, bearing to the left, to a synagogue, neither of which is now in use.

In the palmy days of her business prosperity,

the Jews were a large and wealthy element of the population of Newport, but when her commerce and trade were swept away by the blast of war, they disappeared as pigeons leave a wheat field when the golden grain is all removed and garnered elsewhere.

On our way to the synagogue and cemetery, we pass an edifice and institution of much importance to Newport, and of no slight attraction to those who visit the place. We refer to the Redwood Library, so-called from the gentleman who gave money to erect the first building. This institution which is justly a great favorite with citizens of the

place and the public at large, is centrally and most delightfully located near the head of Bellevue avenue, with spacious grounds, abundance of shade and a structure having an ancient but attractive appearance and a cheerful and convenient suite of rooms. It contains about twenty-five

NEWPORT—FROM THE BAY.

thousand volumes, well selected, some of them quite rare, and a large number of paintings, mostly the gift of Mr. Charles B. King, an artist and native of Newport. We know of no better place in this town of interesting objects to which to go often and spend a few hours than this, where one can drop in quietly and be sure that the courteous librarian, Mr. Rhodes, will do all in his power to make time pass pleasantly and profitably. This library was founded in 1730, incorporated in 1747, and the first building erected in 1748. It is therefore claimed to be the oldest town or city library in the country. The most ancient and central part of the edifice is regarded as a fine specimen of the Grecian-Doric style of architecture, which is very well shown in the superb engraving, at the commencement of this article.

The Free Library, another institution showing the intelligence and sound taste of the people of the "Island City," is favorably located on Thames street, in the upper part of the Union Bank building. It has convenient and pleasant rooms, a

reading-room attached, with about fifteen thousand volumes, and is rapidly growing in the number of its books and in the favor of the public.

At the State-House, which is an old and quaint edifice, used by both the Legislature and the Courts (for it will be remembered that Newport is both a county seat, and jointly with Providence the capital of the State), there is a painting of great value both from the subject and the artist. It is a full length portrait of Washington, by Gilbert Stuart, who made Newport his favorite home, and whose daughter still lives here. The painting was a present from the artist to the people of this town, and they justly prize a gift so rare and valuable.

But why attempt to describe or even enumerate the points and objects of interest in a place where nearly every street in the town and acre of the surrounding country is historic ground, and radiant with the beauty of its scenery and adornments; where almost every spot you tread upon and many of the mansions that adorn the town, have a character and a record, and are associated with something of interest in the past or present? It is like mining in an inexhaustible field of gold, diamonds, and every kind of precious stone.

But among the great number of interesting places, and especially historic ground, and as an exception to the many things that must be passed over, we cannot omit a brief reference to the monument of Commodore Oliver Hazard Perry. This interesting memorial of the illustrious dead, may be found at the Island Cemetery, so-called, and of itself is worth a visit to Newport; not from the splendor of the monument itself, for it is a plain obelisk, which with the plinth or pedestal is only thirty-three feet high, and is exceeded in size and workmanship by many to be found in the private cemeteries of the country. It is noteworthy, because it speaks the deeds of a true hero, and recalls our most brilliant naval victory in the second war with Great Britain.

As we stand here musing upon the scenes of the past, the gallant man, whose honored remains sleep beneath this monumental pile, seems to come up out of the dim shadows of the grave, and casting off the cerements of the dead and the dust and decay of his mortal part, to stand forth, as in life full of patriotic devotion and daring, ready to do and die for his country, surpassing in real deeds the ideal heroes of ancient or modern times.

We behold him in the moment of his triumph, exalted and transfigured as it the greatness of the occasion, as with a head and waving sword, he passes in boat, unscathed by the flying missiles, own shattered flag-ship, to another that serve him till the victory was made complete—more honored dust rests in the precinct city—no more brilliant achievements or glorious memories, are the priceless inheritance of any State.

Both the Perrys, as well as General Greene, have been credited to Newport. They are here, and the remains of the former, as seen, rest here, and no doubt the people of this favored place, that has so much to be proud of, would gladly enjoy the credit that attaches to the birthplace of such illustrious men. But to other towns of the Commonwealth, Newport wants only her own. General Greene, whose fame is second only to that of Washington, was born at Warwick; and Colonel Oliver H. Perry, "The hero of Lake Erie," we believe his brother, Matthew C., "the hero of Japan," had their birth in the little town of Narragansett, in South Kingstown. Rhode Island hath no prouder names, even in her own realm.

While the admirers of Newport cannot but be struck for the scenery in its vicinity the grand and wild picturesqueness of mountain views, they claim that they have a great amount of a beautiful landscape (this term we use in its broad sense, including land and sea views), and in places where land and water combine, rises to the picturesque and grand; that in which everywhere speaks of the mystic and illimitable, and is full of unwritten history here to the best possible advantage, and the elevated location of the town, being in every street and dwelling, whether seen in the quiet beauty of its calmer moods, as it gently kiss the shore, and its surging heart-beats; or when lashed into fury by the sea so that its waves run mountain high and upheave as though lifted from the center of the earth, and towering skyward rush headlong to the shore as if they would break through the rocky barrier and assert their dominion over the land—the view is always full of grandeur and variety. Who does not love to gaze at the

the sea" in calm or in storm? No wonder that the mind of Webster took in its grandest thoughts and drew its noblest inspirations from the sea, vast, boundless—earth's fittest emblem of eternity!

Such is the fertility and verdure of the island, the tasteful adornments of the town, the extent and richness of the ocean views, and the transcendent charms of the whole combined, that no one ever tires of the scenery at Newport. It is always pleasing, and grows upon the sight.

It is known by the name of "The Bluffs," and is five miles in extent, following the windings of the shore. Most of the way the superb cottages of Bellevue avenue are in plain sight, some of them border upon it; and all the way by cross streets, or their being located directly upon the seashore, elegant cottages with their grounds highly adorned with shrubbery, flowers, lawns, etc., border upon and mingle their attractions with this fine walk. The shore itself, once rocky and irregular

BOAT-HOUSE LANDING, NEWPORT.

Boat-house Landing is a rugged, wild spot at the foot of Bellevue avenue, or rather a small street leading to it, where pleasure parties and fishermen go out upon the bay.

Close by, a little to the left, as we face the sea, is what is called "Spouting Rock." It is a freak of nature, consisting of a small cave leading from the water, with an aperture in the top, through which, in a storm, or high waves, the water rushes to the height of sixty feet.

Immediately bordering upon the town and rural suburbs of Newport there are not less than thirty miles of seashore that can be reached at almost any point by going a distance of from one to two miles.

But our purpose in this connection was to describe that portion of it extending from the left of the Boat-House Landing to where the Bath Road, so-called, crosses the beach; or rather, to refer to it, for we have not space to fully describe

in the extreme, has been shaped and beautified so as to set off its natural and artificial attractions to the greatest advantage.

Suffice it, that this walk has no equal at Newport; nor, as far as we know, in the country. As might be expected, it is thronged on all pleasant days in the warm season. A great improvement would be seats, and more shade along the graveled path.

We have repeatedly alluded to the cottage system, the leading feature and crowning glory of Newport. It in fact overshadows everything else, and has probably checked the growth of the place. Though called cottages, many of them are large and spacious mansions, built in the highest style of architecture, and finished and furnished in the most expensive manner, single rooms costing as high as fifty thousand dollars. One cottage, that of Mr. Wetmore, of New York, is said to have cost, with its ornamentation, over a million of dollars.

Yet there are many neat, plain residences here built for convenience and comfort, and arranged in good taste, at a moderate cost.

The stranger is at once struck that the hotels of Newport are so few in number, and most of them so limited in size. There are two that remain open the year round. One of these we did not try; the other, the "Perry House," we did, and found it an excellent hotel, with good fare and most reasonable charges. It is located on Washington Square.

The "Aquidneck," situated on Pelham street, near Touro Park, is a popular house, and remains open six months, although most of the summer hotels and boarding-houses are open but three or four months. While the Naval Academy was at Newport, during the war, the professors boarded here; and officials visiting the place make it their headquarters.

But the great hotel of the place, corresponding to the "United States" at Atlantic City and the "Grand Union" at Saratoga, is the "Ocean House." It is nearly four hundred feet long, by an extreme width of nearly two hundred feet, and is five stories high. It can accommodate between four and five hundred. It stands upon elevated ground, and is most favorably located upon Bellevue avenue. The views from the halls and some of the rooms are charming, especially those that look out upon the water. The commanding prospect and fine panoramic view from the observatory, we have described elsewhere. The Messrs. Weaver are proprietors, one of whom, J. B. Weaver, is connected with the Everett House, at Union Square, New York.

A great deal of superlative nonsense has been written respecting the aristocracy and exclusiveness of Newport, and the extravagance and fashion of Saratoga. The truth is, this town has a great amount of wealth, both among its own citizens and the cottage residents, including quite a number of millionaires, and wealth will always assert itself in some form. The rich will have fine equipages, costly houses, rich furniture, and expensive, stylish dress. The poor, or those in moderate circumstances, cannot imitate them, nor receive and return their visits, because, if nothing else prevented, they have not the means.

Thus, the difference in circumstances draws the lines and makes the distinctions to a great extent. Among the rich people of Newport there is very

little of the coarse, ignorant, shoddy element. There is a great degree of intelligence and refinement among them, and not a few are persons of the finest culture, men of learning and genius have a national fame. We have yet to learn of talent, learning, and character, are not duly respected by them. On the contrary, we are told these are a passport to the best society. Possibly the Newport people lay a little too much stress upon family distinction and even upon wealth. But if united with character or official eminence they are a great incentive to effort, high tone, manly, praiseworthy conduct. And who that does not take pride in these things, and lay stress upon family standing?

Whenever the cottage system shall disappear and become essentially modified, society here will come more cosmopolitan—more like Saratoga and similar watering-places. But who will say this would be an improvement on the present condition of things?

We know of no place that has greater resources for entertaining amusements than Newport. In addition to the games of croquet, ten pins, "hog music," etc., common to all summer resorts, there are the finest drives and most delightful walks almost in the world. The beautiful residences and grounds, the fields covered with verdure, fruitfulness, and the unequalled combination of sea and land views, make these walks and drives joyable and healthful in the highest degree. To the facilities for gunning, fishing, rowing, sailing, and the like, there is no limit to them, except one's power of endurance and capacity to enjoy. There are tiers of smooth, accessible rocks, which afford the best of fishing, and ladies can angle with hook and line without the aid of an expert, or the presence, shall we say interference? of gentlemen. Some sixty kinds of fish are taken in the waters of Narraganset Bay. The libraries, of course, afford every facility for those who are fond of reading for amusement or instruction.

This watering-place is yearly growing in popularity with our countrymen at large, as they learn of its merits; it is becoming more national. More cosmopolitan, increasing numbers are coming from distant parts of the country, and this feature will grow more and more with the future. Formerly great numbers came here from the South, and they were considered among the best patrons and most welcome visitors. Their money was easily

quired and liberally and freely dispensed. With a return of fraternal feeling and prosperity, the Southern people will come here again in great numbers, as before the war, though not perhaps to an equal extent. This with the large increase of visitors from other quarters, will cause Newport to overflow, and call for an immense increase of hotel accommodations. We do not imagine the cottage system will disappear, but that there will be a decided modification of it. The next phase

rapidly, till at the census of 1870 it numbered twelve thousand; by the State census of 1875, over fourteen thousand; and to day it contains not less than fifteen thousand permanent residents. This increase of the permanent population is an unmistakable sign of the ground swell that is coming, and of the work of preparation quietly going on for a great development and growth in the near future. Let those who have declared or thought that Newport had attained its zenith, note these

OLD STONE MILL, NEWPORT.

of development, we think will be a combination of the two, not to do away with private cottages, but to accommodate transient visitors in the best manner. We see the beginning of this movement, which looms up in the future, in the "Cliff Hotel," and the "Cliff cottages," where the cottage and hotel systems are happily combined.

That Newport has a bright and brilliant future we have no doubt. Before the Revolution, and in the days of commercial prosperity, the population numbered about nine thousand; afterwards it declined to about eight thousand, where it remained for many years. Lately it has gone up

signs that it is to become a large town and the chief of American watering-places; or, according to the prediction of one of the most celebrated of her sons, "The great bathing-house of the country." When we consider its beautiful location and surroundings, the mildness and salubrity of the climate, its almost unlimited resources for enjoyment and health, its excellent society, and the many interesting historic associations that cluster here, where shall we find its superior, or even its peer, as a sea-side resort, in America?

Pride of New England and pearl of the sea,  
Thy charms are confessed by all who know thee!

## ARCHITECTURAL PROGRESS, AS SEEN IN THE RELIGIOUS EDIFICE OF THE WORLD.

By REV. WILLIAM BLACKWOOD, D.D., LL.D.

### VI. EARLY ENGLISH, DECORATED AND PERPENDICULAR ECCLESIASTICAL ARCHITECTURE

TOWARDS the reign of Stephen in England, a change in the form of the arch began to appear in church architecture. The semicircular began to into disuse. The question as to the person whom the pointed arch was first adopted, and land in which it was first used, has led to inter-

RAMSEY ABBEY—TRANSITION FROM NORMAN AND EARLY POINTED.

give way to the pointed arch, and at the same time, instead of a massive heavy pillar, a shaft comparatively slender with several smaller columns surrounding it was adopted. These modifications being introduced into England about the year A.D. 1200, led to the use of the term "Early English," as the designation of the style thus introduced, as distinguished from the heavy Norman that had preceded it, and from the later forms which came to be known as the "Decorated" and the "Perpendicular." About the same time the pointed arch began to prevail in other countries, and in a brief period the semicircular arch fell

nable discussion; and it is hopeless to expect that these matters shall ever be settled. The well-known Mr. Britton has collected more than fifty theories or opinions concerning the person, the date, the country or the circumstances connected with the origin of the pointed arch. It has been called "the German manner;" it has been traced through Spain to the Saracens and to England from France. The intersection of Norman arches, as seen on exteriors or interiors on wall surfaces, the interlacing of the branches of trees in a forest, have had their advocates; and Mr. Payne Knight holds that "the pointed was the original arch, of

which the earliest instance known in Europe is the Emissarius of the Lake of Albano, built during the siege of Veii, long before either the Greeks or Romans knew how to turn any other kind of arch; for as this may be constructed without a centre, by advancing the stones in gradual projection over each other, and then cutting off the projecting angles, its invention was obvious, and naturally preceded those constructed on mechanical principles; of which I believe there are no examples anterior to the Macedonian conquest."

Although these points may never be satisfactorily determined, it is safe to hold, that owing to the insular condition of Britain, and the weight of Norman and Continental influences on her people, the styles which prevailed in cathedrals in the larger churches and castles and also in the "Religious Houses" of all sizes, had their patterns in the continental edifices. Besides, it is well known that most of them were built by persons specially brought over for the purpose, or by ecclesiastics who were as celebrated for the architectural skill which they had acquired from continental sources. Still it must never be forgotten, that in England, once these styles were domesticated, they became noted for a peculiar type in which a purity and unity were obvious that never

appeared even in the largest and richest of the continental buildings. On the whole, French cathedrals are loftier than English churches, and they are more lavishly adorned; but the excess of ornamentation confuses, and the educated eye is often offended by details which are introduced

merely for the sake of ornamentation, and in obvious disregard of the style. Thus instead of adhering to the principle of elevation, the upward

range of the column, of the pointed arch, of the pinnacle and the other parts, the element of horizontalism is introduced, as in flat-headed doorways and in broad bands, such as offend on the western façade of Notre Dame at Paris. Greatly enriched as many of the English churches

are, still their effect is produced more in consequence of the long range of the vista from the western entrance to the extremity of the choir, the unity of the plan, and the balance and harmony of the different parts. This will hold good also in the case of the great churches, the parts of which have been erected in different ages, as well as at Salisbury, which of all the first-class cathedrals is built in the same style, the work

marked features of the style. They are either acute, equilateral, or obtuse; but few specimens belong to the last mentioned class. A very notable characteristic is seen in the mouldings of arches. The indentations are very deep, separated by round mouldings, and the hollows between them are so decided as to produce the effect of light and shade. There is therefore a peculiar solemn effect produced by the arches of the

TEMPLE CHURCH, LONDON (SOUTH SIDE).

being begun by Bishop Herbert Poore in the year A.D. 1220, and finished in the space of forty years according to the original plan.

The characteristics of the style known as the "Early English" and sometimes from the form of the windows called "The Lancet" or "Early Pointed," are very distinct from the Norman. The columns on which the arches rest are slender in respect of their height, and they are surrounded with smaller shafts, all standing on a base which assumes the form of the cluster. The capital surrounds the cluster, and it effloresces into a form of great beauty, the foliage being usually extremely elegant. From the columns in a cathedral, the eye is naturally carried upwards to the arches, which sustain the wall of the clerestory, and in this period the arches form one of the most

English period, far more so indeed than which results from the plainer surfaces of later styles. In the hollows of these arches a peculiar decoration called the dogtooth ornament was often used. It had appeared as the Norman was giving way to the Lancet, but it prevailed extensively in buildings of this type that it usually been held to be a feature of the style. It consisted of four small leaves united in a central point which projected outward, and these figures were carried around the arch. The figure was supposed to resemble the dog-toothed violet, hence the name. The transepts of York Minster, the nave and transepts of Lincoln, and the nave of Salisbury and of Westminster Abbey present admirable examples of arches in this style. The windows are tall, narrow, and in shape at

head like the point of a lancet. The earliest windows of this period were quite plain, having no cusps nor other ornamental forms in the head; but in time, when two of these windows were placed close beside each other for increase of light, the separating pier soon became reduced, and by means of a pointed arch thrown over them, the window was divided by a mullion into two lights. When this enlargement was made, a trefoil or a simple cusp was introduced as an enrichment in the window head. In very small buildings a single lancet sufficed in the gable, but the need for more light led to the introduction of two, and even three; and as a matter of taste, the eye was pleased by raising the centre window higher than the others, thus bringing the upward range of the windows into congruity with the upward slope of the roof. Still later, in buildings of importance where the architect had the command of adequate means, a range of triple lancet windows, the centre of the triplet being higher than the others, was introduced in the flank walls, and of this form no more beautiful specimen can be found than the body of the Temple church in London presents.

When architects thus began to unite two windows so as to make one, the step was easy to add a third, a fourth, or more, and thus to make a large and magnificent opening. In Salisbury, there are specimens in which two, three, five and even seven small windows are thus grouped, and the ornamentation of the spaces that stood between the heads of these windows, originated the tracery and foliation which appeared in later styles. In Lincoln Cathedral, no fewer than eight windows are thus combined, and the enrichment of the whole produces a most gorgeous effect. There are four pairs of small windows having a cusped or ornamented circular opening above them; two of these pairs are doubled to make a larger window with a large ornamented circle above them, and lastly, two of the four-fold windows are united with a circle above them, composed of

seven smaller circles, each of which is ornamented with great taste, producing an effect of much beauty. In small buildings of this style the inside splay of the windows is unusually great, but in large structures, and where taste and wealth prevailed, the angles, and often the sides of the

TEMPLE CHURCH—INTERIOR VIEW FROM THE ENTRANCE.

splay were ornamented with small columns, tied together by a band about the middle of their height; and from the capitals, slender arches rose and met in the centre of the splay in the head of the wall opening; thus, although the lancet opening was in itself exceedingly simple, yet its very simplicity, when taken with its surroundings, produced an effect far more impressive than that which resulted from the elaborate display of the flamboyant and other of the later styles. Windows in all these styles may be seen at Beverly, Chi-

vaulting from the capitals; but very soon  
bands became numerous, rising out of the capi-  
as if they were continuations of the slender  
urns of the cluster, and they almost oversp-

EXAMPLES OF THE THREE STYLES.

Roofs in this style were lofty in pitch and  
acutely pointed; groined vaulting forming the  
ceiling in cathedrals and large structures. Thus,  
the elevation of the roof was in harmony with the  
idea of loftiness which characterized the  
style. The whole vaulting of the  
which extended longitudinally  
vault, was decorated at  
bands met with vases of  
mental work. The walls  
ness, but externally the

buttresses, which, by means of their mass, tended to resist the lateral and outward thrust of the vaulted ceiling. The buttresses were made more effective by enriched pinnacles, which added to their weight, though ornament was never introduced for its own sake. When means, however, were available, a member that was necessary was decorated, and thus the pinnacle was terminated with a finial flower, and the angles of the finial were embellished with crockets. In cathedrals, in churches of first class size, and in Chapter Houses, where they assumed an octagonal form, flying buttresses were used. That is, an arch was carried up from the top of the flank wall of the aisle, over the roof of the aisle, until it reached the wall of the clerestory, and thus, the force of the lateral thrust of the great central vaulting was gradually brought down into the outer wall of the aisle, where it died out before reaching the ground. In Chapter Houses, as at Lincoln, the buttress stood off entirely from the main building. It was a perpendicular piece of strong masonry, and from it, at the proper height, the arch was carried to the point where, in the main building, the outward thrust was to be encountered. The perpendicular masses and the arches were always enriched in the peculiar style. During the prevalence of this style every form of enrichment was simple, but wondrously elegant and effective. Where niches for statues were introduced, the coverings rose into lofty pinnacles; and it is worthy of note, that in the smaller buildings a greater degree of adornment prevailed than in large ones; spandrels of arches, and the heads of windows were often embroidered with rich characteristic foliage. In the Norman period towers were low, but in the

Pointed, they rose to a great height, and they were adorned with lanterns and lofty spires.

It ought ever to be borne in mind that in the Norman there were germs which passed into the

WEST END OF LINCOLN CATHEDRAL.

edifices of the Pointed or the Early English period, and when the Early English became modified, there were many elements of that style which were carried into the Decorated; and so from the Decorated, there were forms that passed into the later period known as the Perpendicular. Thus,

## EARLY ENGLISH, DECORATED

was Norman, and Transition Norman, run-  
into the Early Pointed, or the Early English.

OCTAGON OF ELY CATHEDRAL, ENGLAND.

Then the Early English held sway only to be modified by the forms of the Transition into the Decorated; and eventually the peculiar features began to appear in the Decorated which resulted in the stiffer and more massive period of the Perpendicular; a style which was eminently suited for cathedrals and extensive buildings of the largest size. Amateurs in architecture, as well as many who attempt to build, should never forget the fact, that these periods have their own distinctive features in columns, capitals, bases, arches, buttresses, mouldings, pinnacles, finials, bosses, and the various forms of enrichment. The Early English column, arch, window buttress, moulding and enrichment went together, and this made up the style. An educated eye can as easily see the difference between the moulding of a Perpendicular and an Early English arch, as between the Norman and the Early English, and so with other details.

Mechanics who can merely construct a pointed arch, or a "Gothic," are usually in-

different to the *details* of style, and hence, when such workmen have finished their task, many spectators feel that there is something wrong, something wanting, and that the effect is not the same which they experience when beholding an old edifice of a former age, where these principles were known and regarded. There is another point of importance to amateurs and juvenile students in ecclesiastical architecture, to which prominence is given here, with a view to save them from confusion. Let a young tyro be placed on the north side of Durham Cathedral, or on the south side of the York Minster, and at once he is puzzled. At Durham he will see semicircular arches in the windows of the nave, and many of these are filled in with members that run up into the head of the arch; he will see a magnificent window in the north transept although different, and at the east end of the cathedral still other forms prevail. At York, the south transept is different from the nave and the choir, and here is confusion again. Now the solution of the mystery is very simple. All these great cathedrals were built in successive ages, the nave at one time, a transept at a later period, and the choir it may be later still. Every builder wrought in the style which was prevailing in his own day. If an old Norman choir was destroyed by fire, the builder who raised it up again, adopted the Early English or the Decorated, or the Perpendicular style, according to the period in which he lived and

Ornaments were lavishly introduced formerly, but with loss of taste, and gorg seemed to be the character of the style of the French cathedrals in this style, and in specimens abundant where. Examples seen in the chapel of College, at Oxford, New College, as well as Magdalen College, in city; at St. Mary's in the cathedrals at Exeter, York, Worcester, Gloucester, and in the cathedral of Lincoln parish churches may in great numbers, the elements of this presented in the richness of decoration. To make the decorated is more

decorated very easily, indeed naturally, to the Perpendicular. When windows were very lofty and wide, the weight of the gable tended to crush the delicate

tracery and complicated ribbing with which the arch was guarded against this which was imminent in this class of windows in cathedrals, the expedient adopted of carrying more mullions up perpendicularly into the head of the arch, and thus supporting it to the arch. In very large windows also, a cross bar, or transom, was introduced as a support to the mullions perpendicularly. In a short time more tracery was used, and some of the mullions were carried to the head of the arch, and when several transoms were introduced the window presented the appearance of stiffness. In the west window of Winchester, eight transoms rise into the arch, and are crossed by five transoms dividing the whole into four small windows, and small openings of a similar character at the spring of the arch.

In the period the arches were of larger openings, the tracery on the vaulting more abundant and generally all the tracery was more abundant than the earlier styles. In very gorgeous examples it could remain. Henry the

third's chapel in Westminster, the college chapel in Cambridge (which is perhaps the finest single chapel in the country), George's chapel at Windsor, are perfect examples of Perpendicular work. During this period cathedrals that had to undergo repairs were restored in this style. Gloucester Cathedral, Winchester, Peterborough, Canterbury, and Ely, all present illustrations of a very similar character.

It would seem that in the Perpendicular, the pointed architecture had culminated, and it was soon destined to set in a splendor of lavish ornament. During the reigns of the Tudor family, it

INTERIOR—HENRY SEVENTH'S CHAPEL, WESTMINSTER ABBEY.

rapidly degenerated. Arches became flat, and windows were reduced in height; roofs were depressed, pendants were hung from the groins of the ceiling and fret-work in abundance covered the walls. The age seemed to have lost the knowledge and the love of the past, without any capacity to introduce a style for the future, and so the Tudor was really the debased form of the perpendicular, when it fell into a hopeless decline.

Norman may be said to have come into England by the invasion of William the Conqueror, and by A.D. 1144 the Early Pointed, or Early English prevailed. It was cultivated

modifications demanded by household requirements, and a late style of these dwellings became known as Elizabethan or bean.

KING'S COLLEGE CHAPEL, CAMBRIDGE.

until A.D. 1280 when it passed into the Decorated, and about A.D. 1380 the Perpendicular was fairly established, holding its sway until A.D. 1550 or the middle of the sixteenth century, when it sunk into the Tudor. In domestic buildings pointed forms had been used with

The relative styles of the great churches the differences which existed between the continental and the British churches, must be to the introduction of the next paper, which treat of the style that immediately after began to prevail.

## THE MYSTERIOUS MONOGRAM.

BY WARREN WALTERS.

"The threads of our lives are so interwoven with the threads of other lives that we are not able to disentangle them, or to divine what other threads they may cross. In the woof and warp of this curious fabric we call life, I am convinced that among the many strands which cross and recross our existence, there is one and only one with which our lives can make a perfect union."

"Then, Mr. Carlyle, you believe that not only my life, but that of the shivering beggar on the street is tending to some other life, not unlike itself, with which it can only vibrate in harmony, and that found, there is perfect happiness; at least, the highest happiness of which we mortals are capable?"

"No, Miss Bronson, I intended no such sweeping assertion. There are natures so commonplace, people whose nerves are not acute, and the currents of whose lives are never stirred by strange magnetisms—that they are incapable of tension. And even with those of a sensitive organism there is more frequently failure than success; there are so many objects to divert our destiny and our beings are so inextricably involved with others. We are more liable to bind our souls to those not quite our mates, than that the current of our existence should thereafter mingle in perfect unity."

Ida Bronson looked thoughtfully into the fire, while Percy Carlyle covertly studied the fair girl beside him. The busy hum of conversation among the large party of handsomely dressed men and women who made up the social gathering to "watch out the old year," went on. She was a Southern girl, whose father found wider scope for his great talents in New York, and after the death of his passionately loved wife had removed to the great city. His fortune was not yet made, although he was not lacking a comfortable income. Ida, his only child, was idolized, but not spoiled, and a rich type of Southern beauty. Imperially proud was she, and of noble bearing; one whose character was of the queenly mould and whose loveliness made men passionately yearn to have her forever in their keeping. In her presence men felt a strange exaltation and a desire to appear and bear themselves like princes. There was a strange-

ness in her beauty and her bearing unlike that of others, and it was a remarkable phase of her character that she sometimes seemed to be withdrawn from the outside world and became oblivious to speech or sight. Her eyes assumed a far-away look and no words would issue from her lips. When this semi-trance had first developed itself, it gave her friends much alarm and the highest medical authority was consulted, but gave no satisfactory solution. As it had no apparent evil results upon her health or mind it was finally dismissed as "only one of Ida's strange ways." She was a being of mysterious impulses, full of fine fire and subtlety, and a lover of all weird places and fancies. Percy Carlyle was the most favored of her many suitors, and it was understood that he was more likely to bear away the prize, although there were many young men who still desperately disputed the honor. In every way he was considered a "proper match" for this rare creature. She had been especially gracious to him this evening, and he felt more than confident that he would eventually claim her for his own. In some way the conversation had turned upon the discussion of "affinity" in the pure sense of the word, and as a result of the conversation Ida had assumed the semi-trance state with which he was so well acquainted. It had never given him uneasiness before, for he, with others, only marked it as a strange and harmless peculiarity of a beautiful girl; but to-night it seemed that it boded evil for his suit. It now wanted but a few minutes of twelve, and the gay company sat silently watching the hands of an elegant clock on the mantel slowly ticking away the last few moments of the year. The hush was oppressive, and Percy's heart sank within him as he heard the silvery chime begin to count away the last few seconds. It seemed to mark the knell of his hopes, and that, notwithstanding the favor which had but an hour before thrilled him, this hateful chime declared that hereafter their lives would grow apart. Seven—eight; the door opened and a servant noiselessly entered and presented on a silver salver a purple sachet of velvet to Ida Bronson, embroidered on which, in gold thread, were some mysterious characters.

Eleven—twelve! She took it from the waiter and with a startled glance rose and retired to the dressing-room. This simple action for a moment naturally aroused the curiosity of the company, while to Percy it seemed filled with ominous meaning.

When she reached the room she closed the door behind her, eagerly opened the sachet, and took from thence a beautiful necklace formed of gold and opals. It was strangely exquisite and strangely barbaric. The centre-piece was of dark stone cut to represent an Egyptian seeress, whose eyes were small diamonds. Two satyrs' heads were linked to the centre-piece holding in their teeth two delicate chains of gold, to which was suspended a monogram, made of writhing serpents. She gazed for a moment at the beautiful ornament, and then placed it about her neck, the serpents falling down upon her breast. The rich lace about her regal throat concealed the valuable charm from vulgar eyes. The mysterious portion of her inner self took it as nothing less than a portent, while the following note enclosed in the sachet confirmed the idea she was eager to seize. There was no date or signature to it:

"With the new year comes new life; and with it accept the devotion of one whom you know not, nor have you seen, nor will you see until the fullness of time. Should you yield your life to another's keeping, destroy this amulet, since its mission will cease. He that gave it, charges you to keep it and his heart."

Robert Lee, professor of languages, resigned his chair in St. Clement's College to sail with an expedition to Arabia, and set sail the first week of the new year. His sudden resolve was a matter of regret to the authorities, for he was held in high estimation, both for his learning and his courtly manners. He was a Virginian whom the war had ruined, and after the strife ended sought and obtained his present position. He had travelled throughout Europe and the Old World when much younger, and therefore it was not much a matter of surprise when he announced his determination to revisit the land of the Sheik and Bedouin. Few men could compare with him in point of personal or mental beauty. A member of the most aristocratic family in the Old Dominion, his culture and his manners were fascinating, after the world-renowned style of his race.

Extracts from his journal tell his story better than another's pen, and from it such excerpts are

taken as have to do with the facts narrate strange episode. The first one bearing on the subject reads thus:

"I sailed for Alexandria, in Egypt, Jan. 1, with the intention of making my fortune. I was satisfied that my present professorship would give the independence which, for a reason only to myself, is necessary to my future. It was not many days ago that I considered myself happy and contented in what I hold to be the noblest profession in the world, save one. I thought to live out my life striving for the benefit of my fellows. But this is all undone for me almost in the twinkling of an eye. I can no longer content myself with such a life under the present circumstances, than I can create perpetual happiness. Fate, or by whatever other name men call it, has made it an impossibility; I *must* be wealthy, or it is necessity—and if I fall into the grasp of Fate, wealth unattained, then welcome the grave. In the present, there are for me no doubts. I am determined to believe and say to myself 'I will succeed.' With an indomitable spirit, therefore, I go forth to my fate, resolved to gain either wealth or death. My plan is to push my way into the interior of the desert with a small band of trusty followers, and purchase such merchandise as is easily transportable, and which is to be had for almost nothing, but of great value at points of shipping. I mean to keep myself from the large bands of robbers who infest the land by celerity rather than by number."

"February 15. To-morrow I start for the interior, having secured as my leader Ben Adar, a man of great prowess and skill, one who combines craft and knowledge of the desert with the courage, determination, and faithfulness of the Englishman. He is the son of an English officer and a pure caste Arab woman, born, of course, 'out of the East.' I am provided with fleet and hardy horses and dromedaries, as well as a goodly quantity of attractive merchandise, money, and a small outfit of necessaries."

"March 21. I have succeeded thus far in my hopes as to the time required to reach the interior where such merchandise as I require is to be had for petty prices, but have not been able to reach the amount I expected. If I am so fortunate as to reach Suez in safety, on my next trip I will increase the size of my caravan. My goods consist of a few precious stones (on my next expedition I will go beyond this point, since I learned, after a

the major portion of my load, that fifteen miles to the northeast there is a tribe whose jewels are much finer), a number of pure-blooded Oman colts, the rarest and most valued stock of the Arab horses, some fine silks and shawls, and a few pearls, emeralds, onyx and opals—these last mostly small and imperfect. We start early to-morrow on our return trip."

"April 19. All gone, and within but a few days journey of a comparatively safe country. Yesterday, as we were about to skirt a grove, as is my custom, I sent forward some Arabs to see if our way was clear. They returned and reported nothing to indicate danger, and that they had gone beyond the trees to the open plain. Alas! our interrupted good fortune thus far betrayed us, for we had not proceeded far into the wood before we were set upon and the largest and most valuable part of our treasure carried off. The Bedouins overpowered us, and after the manner of their reckless race, dashed upon us and in a moment were away again having spurned the meaner part of the goods. We considered ourselves fortunate in recovering some of our animals, the onset of the robbers frightening them out of the reach of the pillagers, who are ever too much in a hurry to pick a caravan clean. Strange to say, this almost total wreck of my prospects affected me but momentarily, for after we gathered up the fragments and leavings, and I found that there still remained to me *something*, I was not cast down. I have to-day a plan matured to start another expedition. All I care for is the loss of time. I feel, nay, I know success will attend me, and in Ben Adar I have a host at my back. I find him much above his class, and can see that notwithstanding his lofty Son-of-the-Desert air, he is strangely attracted to me. I have promised when my object is attained that he shall go with me to America—the highest ambition of his life, and I presume a legacy bequeathed him in his English blood. I have ordered camp here, and will go and look for game in this fateful copse of woods.

"Near Midnight. I little imagined a few hours ago, the destruction of my caravan would place in my hands what is worth a hundred such petty affairs. I am rich beyond my wildest dreams! all there remains for me to do is to transport my treasure-trove a few leagues farther, where I shall enter the land of Hadjazmut, through which travel is tolerably safe, and safer as we draw nigh Suez.

I can hardly write, both from excitement and a strong desire to go back and make sure of my new-found wealth—much the same impulse, I imagine, as the murderer feels when he is drawn to revisit the scene of his crime. It attracts me like a powerful magnet. Let me write down what has occurred, and by that time perhaps I shall be calm enough to decide what is best to do: When I left camp I went directly north, and had not proceeded more than a mile when I came upon the ruins of what had once been a dwelling, evidently not that of a native, for it had been formed of stones and wood, although there was not left one stone upon another to tell its history. On examination, I discovered small shreds of cloth, matting, and paper—this last article surprising me greatly—and the conclusion was well-nigh irresistible that some white person (not unlikely a countryman of mine, as they are ever noted for their eccentricity) had inhabited it. The destruction had evidently been recent, and in hope of discovering some clue I overturned quite a number of stones. Upon one of these I found characters cut with some rude instrument. It seemed to occupy a rather central position in what had once been the structure, but I managed to lift it and was still more amazed to find a large iron plate underneath. My whole being was now wrought into phrenzy, and I succeeded in getting it out of place. Hastily putting my hand in the excavation it concealed, I discovered quite a number of parcels wrapped in the coarse cloth used by the Arab merchants for packing their goods. These unwrapped, I found that they were used to protect boxes of valuable diamonds, pearls, and ingots of gold and silver. I put them back hastily, replaced the coverings and endeavored to cover up the spot as naturally as possible. After all this, I find myself here in camp with emotions beyond the power of pencil to transfer to my journal. What must I do?"

"Early dawn. I cannot sleep, nor have I closed my eyes. Have just finished a long conversation with Ben Adar, whom I woke up, after arriving at the conclusion that I could do nothing without a companion. Everything seems clear to me now that I have secured an ally, who is both more powerful and more crafty than I. It has been agreed between us that I am to allow him to manage the transportation and to give him one-third of the treasure. For a moment this cession gave me a pang. I rebelled inwardly at his assumption of

the 'lion's share,' as I for the moment called his claim. But when I reflected upon the improbability of securing the treasure by my own unaided exertions, and that it represented far more than the sum I required, I choked down my unreason, and felt the better for it."

No more entries are made in the journal until some days later, the hiatus doubtless being occasioned by the excitement and labor incident to the care of this discovery.

"I have lost my reckoning of days, and cannot just tell at this moment whether two or three days have intervened since my last entry, so I content myself with a record of what has been accomplished. We shall take up our march at dawn tomorrow, having been reinforced by guards and dromedaries. The men have been and are out on a grand hunting excursion of two or three days, prizes being offered by Ben Adar for the most successful hunter. The ostensible object of this is to procure sustenance for our journey; but in reality it was ordered so as to allow us to work undisturbed at an arrant piece of folly devised by Ben Adar. What possible use he can have for the excavation we have been digging I cannot conceive. I have remonstrated with him, but only get some irrelevant reply in the shape of a Turkish proverb. He has intimated that it is to be used as a blind, but how, when, or where I cannot divine. Yesterday he despatched two men for a quantity of rough packing-cloths and rope, and we are momentarily expecting their return. The treasure remains just as we left it, for at the first opportunity I disclosed its position to Ben Adar. I have repeatedly urged the necessity of packing, but he has deferred it until the last moment, that we might finish this tiresome hole in the ground, which he insists upon digging. He has warned me to take rest and sleep to-day, since we shall have to labor all night. He is now calmly sleeping, and I can see him just a few rods beyond, quietly reposing at the foot of a palm tree. I am glad there is no more digging to be done, else I should be inclined to rebel. But I must put aside my pencil and try to sleep."

The next entry is dated at Alexandria, a month later.

"All safe at last. We entered Alexandria this morning, and Ben Adar having unloaded our travel-worn beasts, we have exhumed the treasure a second time from the dirt and deposited it in

strong boxes at the bank. Thanks to Ben Adar's sagacity, we have not lost the worth of a c of our load, and have made a remarkable passage. I have the time now that this golden is off my mind, to give the details of Adar's most successful ruse, to which I am indebted for the preservation of my fortune. The part of the night previous to our departure the ruined house was spent in securely packing jewels and ingots in great bags of cloth, the articles being carefully hidden in the loamy soil had excavated with so much exertion. Long before morning came, Ben Adar aroused the men, and after a hasty breakfast, called his followers together. They were all in the finest physical condition, having fared sumptuously and been successful in the chase. After obtaining silence, he addressed them in their own language. The first sentence he uttered astonished me, he rushed forward to stop his revelation, but declared that I had found an enormous treasure, but something in the chief's look stopped me. I succeeded in reaching him and warned him not to allow him his own way. He then went on to say that we had taken it from the soil and it was to be placed on the dromedaries' backs. His words of caution, incitement to bravery should be attacked, and the promise of a handsome reward for its safe delivery in Alexandria, gave pleasure to the men, and voluble promises of safety and diligence. He also informed them that their movements would be by forced marches and in the night; that the faster we proceeded, the greater the reward. Ben Adar was a man respected among them; his word and promises were held in high esteem. His address had been terse and admirably to the point. He closed by ordering them to follow through the gray dawn to the treasure. Very eagerly they assented, and they confronted the great bags ready for their journey, their excitement knew no bounds. The first two animals were then led up, Ben Adar giving command that no one should superintend the loading but himself. I felt myself blanching when the first two bags broke open, and fell upon the earth a quantity of loam, but no pack and began to grow wild at the fear that Ben Adar had stolen the precious part of the loads. A glance at his dignified, honest face, and the sober words, 'The others will not break,' these were meant to,' assured me, and I saw that

the trick. The Arabs looked disgusted, as they saw the common earth roll out, but the re-announcement of the reward should they carry the bundles safely, sworn to in the name of Mahomet and the Koran, reassured them. He bade some gather up the earth carefully and repack it, while others were ordered to place the unbroken bundles upon the backs of the animals. As we journeyed along I had many an 'inward smile' over the Arabs, who covertly made much sport of the deluded American who was transporting at much expense a mass of desert sand, with the idea it was valuable. Ben Adar's well-known probity, however, assured them of a reward, and it mattered not how this 'trash' turned out. The crafty chief's stratagem served two purposes: first, none of the band thought it worth while to meddle with the sacks since they contained nothing of value; second, it offered no inducements to the prowling bands of Bedouins, for had our guard suspected the value of the contents, it is more than probable they would have communicated the fact, and we would have been much more liable to attack."

There is little more of interest to quote from the diary; suffice it to say that the caravan reached its destination, and Ben Adar and his master set sail for America with their treasure.

Percy Carlyle made great effort to cast aside the foreboding of New Year's Eve, and while it was apparent that Miss Bronson enjoyed his society more than that of other admirers, he could not rid himself of the idea that somehow her life had passed out of his orbit, ever since that eventful New Year's Eve. He could not discover one action or word to prove his fear, and would have scouted it as unreasonable, had it been possible; but day after day the intangible and indescribable something seemed like a mist to grow denser and blacker. It wrought upon his nerves, and made his life almost unendurable. He was impelled to put it all to the test, and at the same time this something held him back. He feared, and his hopes were never buoyant. He postponed the question as long as possible, and by every art and device strove to dispel the cloud, until at last determined no longer to bear the suspense. Very gently she put aside the proffered love, but in the depths of her glorious eyes he saw the lambent flame of sorrow burn—sorrow that her lips were to give him pain. He urged their long friendship,

their many points of taste and culture in common, and his burning love, in words of impassioned eloquence. When pressed for the reason of her refusal, among other things she urged was the fact that he was one to whom much had been given, and who was content to hide his talents in the earth. He drew from the conversation that followed that she had never met one whose lines were seemingly so in unison with the lines of her own life, and quoted his words, "there is one and only one life with which ours can make a perfect union, and we are more liable to bind our souls to those not quite our mates, than that the current of our existence should thereafter mingle in perfect unity." "I can never," she said, "risk my happiness so long as a doubt remains that somewhere in all this world there is not a spirit more perfectly mated with mine. Ever since that New Year's Eve the incompatibility of our temperaments has grown upon me, even against my will. I know you will not accuse me of an unmaidenly thought, when I say up to that time there was no one for whom I had a higher regard; but while we were then speaking came the thought, that the current of our lives would not thereafter run together; that your path and mine must diverge. To-night I feel that we have drifted apart, and as the years go by we shall be wide asunder as the poles."

Months later he again broached the subject, in the hope that this thought might have passed away, but he found her more than ever convinced of its truth. Their friendship was strongly put to the test, and when her father spoke in the highest praise of her suitor, she never wavered in her faith. Percy Carlyle felt that he would never be able to bridge the gulf between them, but could not resolve to leave America and in new scenes heal a wounded heart. Not long after, Percy asked and obtained permission to introduce a gentleman, a former resident of the city, who had just returned from an extended tour on the Continent. When Ida entered the parlor she was struck by the very handsome bearing and manner of Percy's friend, and before long found herself entranced with his manners and mind. He seemed to be her ideal of a noble man, one whose heart and whose every-day life was that of a Bayard or Sir Walter Raleigh. This visit was but the precursor of many others, and the days rolled on weaving about them the ties of a free and noble interchange of mind

and intellect, of pure-heartedness, with the subtle fire of a chivalric spirit. Percy looked upon the growing intimacy with sardonic pain, fearing and hoping for the issue. Ida found in the company of this new-comer a satisfaction she had never experienced before, a feeling much akin to that which she produced upon her gentlemen friends; it seemed as if the whole scope and vision of her life was enlarged, and she breathed an exhilarating draught of pure air. She often wondered if their lives were not drawing closer and more closely. In her chamber, however, these thoughts were checked by a sight of the monogrammed bracelet. She felt that the wearing of the jeweled charm was a tacit acceptance of the donor; at least that she ought not to give way to such reflections so long as the owner of that ornament remained undiscovered.

New Year's Eve had come again, and she had accepted the invitation of Percy's friend to act as her escort. The company was as select and as handsomely appareled as before. Dancing was at its height, and by common consent the clock had been removed that no solemn thoughts might stop tiny feet in their enjoyment. Ida had danced several times with Percy and other of her friends, when her escort appeared and took her from "the floor" to promenade. The warmth of the room and the exercise naturally brought them to the conservatory, one of the attractions of the host's grand mansion. The music was borne on the perfumed air, and rendered more delicious by distance, as it came floating through the beautiful roses, camellias and lilies, which were blossoming in the conservatory.

"We are just about to pass into a new era," he said as they stopped before a magnificent bloom of red-lipped fuchias and white petaled lilies. He drew forth his watch and turning its face towards her, she saw that the hands marked but one minute of twelve. Her thought reverted to this time last year, the chained monogram now

pulsing with her heart-beat. She was freed from these recollections by the sweetly chiming bells in the handsome article held in her hand. Before it had finished its stroke he replaced it in his pocket and holding in his fingers a brilliant diamond on which she saw the counterpoised mysterious characters which were suspended from her necklace, said: "Will you wear this with it the heart offered you this night ago?" Her eyes were aflame with the tide of passion she had been holding in reserve, as her lips answered, "yes." Around her waist his arm crept, and upon her lips she felt the ecstatic kiss of a reverent, heart-born lover. Eagerly she listened to the romantic tale he recounted of the presumption of a poor student for the acknowledged belle in the city; of the sudden resolution taken to marry for himself, when he saw her radiantly looking for the first time; of the dangers and toils he had to desert, for one with whom he had never exchanged a word; of his fears that his gift and devotion would be forgotten; of the brave he had loved without a meeting, promise, or so much as a word, went out to gain his fortune, with the token from his heart's desire. These and other points were recounted, before the unknown crush of fashionables broke in upon them. She was with a grateful heart though not without sorrow, that she noted Percy's face returned to the dancing saloon, and saw that he read aright the cause of their absence. She knew too well that he must no longer hold her so treasured in his heart, for henceforth her life would be woven with another's.

The ring and the necklace, the latter given from a grateful Arab Sheik on Robert's recent visit to Arabia, now gleam in public on the finger of the most attractive and most noble-hearted woman in society, and nowhere has love a more potent throne than in that household.

## HISTORIC CHARACTERS—SOUVENIRS OF THE REVOLUTION.

By S. D. NEVETS.

As shown on page 34, the first subject of our sketch, was a woman of rare personal beauty and social prominence, and contributed very considerably to the success of certain military measures, by communicating to her father and General Livingston, of New Jersey, information which she was enabled to obtain through a large circle of influential friends in New York, by whom she was trusted, as "the widow of an officer in his Majesty's service," and "herself a born aristocrat;" whereas she was in truth an ardent rebel, and her entire heart and soul were with the cause of her father and her countrymen.

## MRS. MARY LITCHFIELD,

subsequently the wife of Dr. Charles McKnight, was the young widow of Colonel John Litchfield, of the British army, and the only daughter of Hon. John Morin Scott, of New York, of whose valuable services in the cause of American Independence a brief account was given in the *American Historical Record* of May, 1874. Mrs. McKnight inherited the intense patriotism and love for the popular cause which so preëminently distinguished her father, and which was to be expected in one sprung from the blended races to which she owed her ancestry. On her father's side she was of ancient and historic Scottish lineage, while her mother (Helena Rutgers, of New York), was of very prominent "old Dutch stock," and her grandmother (Marie Morin) was a daughter of an equally prominent French Huguenot family which settled in New York shortly after the Revocation of the Edict of Nantes.

## CHARLES MCKNIGHT, M.D.

The present appears to afford a suitable occasion for brief allusion to this distinguished surgeon and physician, whose short and brilliant career leaves but small material for a biography which would prove of interest to the general reader. We do not therefore offer this article as anything more than a mere tribute to his memory, and to the patriotic zeal that he displayed in serving his country in a most arduous and laborious capacity at the time of her utmost need. It is rather to be

taken as a general historical reminiscence of himself, his family, and their connection with the events of "a hundred years ago."

Dr. McKnight was the eldest son of the Rev. Charles McKnight, an earnest and much respected clergyman of the Presbyterian Church, who commenced his ministerial career as pastor of the united congregations of Cranberry and Allentown, New Jersey, at the first mentioned of which places he resided, and where the old parsonage—a large and spacious house—built for him by his parishioners about the time of his marriage (1746) is still standing; to which he brought his wife, Elizabeth, daughter of Richard Stevens, of Freehold, and where their son Charles was born, October 10, 1750. Rev. Mr. McKnight appears to have come to America about the year 1740, as he was received by the Presbytery of New Brunswick, New Jersey, in 1741 and ordained in 1742. He was cotemporary with the Tennents, and with him the Brainerds chiefly made their home while engaged in their celebrated missionary work among the Indians in the vicinity of Cranberry, where was situated their "town of Bethel, which David Brainerd began, and his brother John completed." Rev. Charles McKnight was a son of the "Rev. John McKnight, a minister of eminence and respectability, in Ireland," and the family was of that patriotic "Scotch-Irish" stock to which the successful issue of our revolutionary conflict is so greatly due. His family, originally of Scotland, located near Lisburn, in the county of Antrim, Ireland, at the commencement of the seventeenth century, where they subsequently distinguished themselves in the cause of King William. Mr. John McKnight, grandfather of Rev. Charles McKnight, was one of the defenders of Londonderry in the memorable siege of that city, and afterwards lost an arm at the decisive battle of the Boyne.

The more interesting portion of Rev. Charles McKnight's career was connected with his pastorate at Shrewsbury and Middletown Point, New Jersey, over which congregations he was installed in April, 1767. Hon. J. T. Headley, in one of his series of articles entitled "Clerical Heroes of the Revolution," published in the *New York Ob-*

sermon of October 21, 1874, alludes to him as follows:

"At the commencement of the dissatisfaction with the legislative acts of the mother country, he had been accustomed to express sentiments adverse

his parishioners, and set the example by dividing his two sons<sup>1</sup> to the field. He did not, for one moment, to doubt the ultimate success of the attempt at independence, assuring his parishioners that "God would take care of their liberty

MRS. MARY MCKNIGHT,  
Wife of Dr. Charles McKnight. Born July 17, 1763. Died September 10, 1790.

to the crown, with a boldness that caused considerable dissension among his people."

Less than fifty years ago there were still many aged people living in the vicinity of Shrewsbury and Middletown Point, who could recall the fervid words and impassioned expressions of their pastor when he got on his favorite theme of the rights of the people, or was expressing his sympathy with those elsewhere who were leading their countrymen towards national independence. When hostilities finally commenced he openly urged forward

would take care of the red-coats." He was at the battle of Princeton, and stood so near General Mercer when he fell, that he received a sabre cut on his head. In the autumn of 1782

<sup>1</sup> Richard, the younger of these sons, held a captain's commission in the New Jersey line of the army, and being taken prisoner by the enemy, was placed on one of the ships in New York harbor, where he met the miserable death of a "prison ship martyr," leaving two young sons, both of whom appear to have inherited their father's adverse feelings. One died, while a medical student, from yellow fever.

church at Middletown Point was burned down by a detachment of British troops, and himself made prisoner. His zeal and patriotism were so well known that neither his profession nor his age could protect him from the cruelty of his enemies. The

enemies seeing he was about to die, set him at liberty. He died January 1st, 1778.

He was one of the early trustees of Nassau Hall, or Princeton College, where his son Charles—whose portrait appears herewith—graduated in

"Senior Surgeon in Flying Hospital," Revolutionary Army. Born October 10, 1750. Died November 16, 1791, aged 41 years.  
(Original Miniature taken after death.)

old patriot, verging on his threescore and ten, was carried to New York and placed in confinement. Under the insults and sufferings to which he was exposed his health gave way entirely, and his

during attendance upon the sick; and Daniel, who was of a roving disposition, having engaged in mining operations in Mexico, is believed to have been the Mr. McKnight said to have been imprisoned by the Spanish Government officials at Sonora, on suspicion of being a spy of the United States, and to have died there after "having lain in chains for eleven years."

1771 ("primum candidatum"), in the same class with James Madison, Philip Freneau, Brackenridge, Bedford, and other distinguished men of the Revolutionary era.

Dr. Charles McKnight entered the American Army upon the commencement of the Revolution, and was appointed "Senior Surgeon of the Flying Hospital," April 11th, 1777. In 1780, before attaining the thirtieth year of his age, he acted as Surgeon-General, and thence until January 1782, as Chief Physician of the army. The late Dr. John

W. Francis said of Dr. McKnight, in the *Medical and Philosophical Register*: "In the discharge of the important and arduous duties of his station, his talents and indefatigable zeal were equally conspicuous, and he was preëminently faithful in the performance of all those duties which the peculiar situation of his country required, and his humane disposition led him to undertake. At the close of the war he was appointed Professor of Surgery and Anatomy in Columbia College; where he delivered lectures on these two branches of medical science, to a numerous and attentive class of scholars, while the profundity of his research and the acuteness of his genius gained for him the approbation of the most fastidious. In a life of constant activity, both as a practitioner and a teacher, he continued until he had arrived at his forty-first year, when death (the ultimate result of an injury received during the war) put a period to his labors and usefulness." The late venerable President Duer of Columbia College, states that Dr. McKnight, though very eminent as a physician, was particularly distinguished as a practical surgeon, and at the time of his death was without a rival in that branch of his profession. He died November 16, 1791. The late John M. Scott McKnight, M.D., of New York city, was his only son.

#### SPIRITED LETTERS FROM A LADY TO A LADY.

MY DEAR NANNY: I did not receive your agreeable letter till yesterday. You cannot imagine how happy it made me, as I have long wished for and long expected a line from you. You complain of being low-spirited; my dear Nanny, you are not more so than your friend. We hardly live now; sometimes news that distresses us, and sometimes news that makes us most happy. I am so glad to hear that General Lee has defeated Lord Dunmore; I wish to God we had the villain a prisoner here. We were very much alarmed about three weeks ago at Elizabethtown, as we were told early in the morning that the regulars were landing at the Point. Only paint to yourself our distress at hearing our enemy was so near us; the whole town was in the utmost confusion, everybody making their escape. We, almost frightened to death, ran with the rest, without a single rag of clothes but what we had on our backs, but before night we got our clothes and plate removed to Springfield, where we now are. It is a most shocking place, not one person that we can visit; we live at a publick

house, and all I wish and pray for is that we be able to return to New York in the winter, happy we shall all be when we meet again, grant that we may. If we can't return to New York in the fall we shall go to Elizabeth. I have often wished myself with you, my dear Nanny; do try and persuade your mamma to go to New Jersey in the winter; I am sure she will get a house in Elizabethtown, and I long to see you once more. News I have none to write you that can be depended upon; there are so many false reports we never credit any of them. The regulars remain pretty quiet on Staten Island, but only knows their wicked designs. We must learn to bear our troubles with patience and resign to it is the Lord's will. All will be well again, and we be restored to our old habitations, happy once more. I feel in pretty good spirits this afternoon as I expect to see my dear father to-morrow; he is to meet us at Newark, and it is the first time of our seeing him since we left New York. They have made him a General, it is true, but I wish they had not; what a distressed family he leaves if he was to fall in battle. Your brother, I suppose, writes you all the news that is stirring in New York. I have had an intermitting fever, but I came here but am quite recovered. Give my love to Sukey and tell her I wish her joy of her new admirer; I really think she is the old darling indeed; tell her she must make use of him for it is a great thing now to have a servant, every gentleman is so much engaged in the war. I expect to hear you have all got New England sweethearts, I suppose you have one but do not tell me—well! they will help to pass the time away if it is only in laughing at them. Please present my best respects to your mamma and my love to your sisters. My mamma desires her love. My dear little Betsey is well and grows fine, you see Mrs. Rodgers give my love to her and try and come to New Jersey in the fall, if I may, I sincerely wish my dear Nanny of your truly affectionate friend,

MARY LITCHFIELD

SPRINGFIELD, July 24th, 1776.

MY DEAR NANNY: I received your agreeable letter a fortnight ago and would have answered it immediately but was ill with my old complaint which was very severe and lasted some days, but I am now recovered, thank God. We are all

every day here expecting our enemy over, a horrid situation, not one easy or happy moment have we had since we have been in New Jersey. Oh! how I regret not going to New England. If it were possible we would go yet, but here we must stay. God only knows whether I shall ever see you again. If the regulars should get possession of this place, what will become of us, where shall we fly for safety? I am almost distracted when I think of it; there are so many alarms of their attacking us and we expect it every day. We have our coach standing before our door every night, and the horses harnessed, ready to make our escape if we have time. We have hardly any clothes to wear, only a second change. You, my dear Nanny, are happier than we, you are further off from the horrid noise of war. Oh! how dreadful to hear the drums beating to arms, and the cannon roaring. Last Sunday morning there was a very heavy firing between two ships going down the river and our batteries, we all here thought they had attacked New York. Last Wednesday about noon we were alarmed with a report that the enemy were to attack the Point; General Livingston sent us word to go out of town as soon as we could. We went just before dark, it looked very likely for a heavy shower and we had not gone above a mile before we had the most violent storm I ever saw, the flashes of lightning were incessant, and one continued peal of thunder, and very dark except what light we had from the heavens, which seemed to be in a blaze. Old daddy Cesar was so frightened he could not manage the horses, so mamma sent me outside to drive. We were obliged to stop all night on the road and all the lodging we could get was a dirty bed on the floor; I need not tell you how hard it seemed for us who have always been used to live comfortable. The weather being so bad prevented their attacking, I suppose, and the next morning we returned to town, and this afternoon while we were in church we were all alarmed with the sound of cannon. The regulars fired on our men at the Point and we returned the compliment; it lasted about an hour, but thank God it is now over. We would return to Springfield, but our rooms being at a public house, and that constantly full of soldiers passing and repassing every day, it will never do for us, so we will take our chance with the rest. We heard from my dear father yesterday, who informs us that about 9000 regulars are landed on Long Island and are now at

Flatbush, and are entrenching there. We have had two or three skirmishes with them, in which we have had the better, we have killed several of them and our troops took 4 of the dead bodys, one of them was an officer belonging to the foreign troops. Papa with his brigade have gone over to Long Island, which makes us all very uneasy. Poor New York, I long to have the battle over, and yet I dread the consequence. I am afraid you will be tired with this dismal subject so will say no more. My love to Sukey and tell her I am sorry her admirer has left her. As to what you said about Doctor — — in your first letter, there is nothing in it; I am very much obliged to him or any of my friends for speaking well of me. I delivered your message to Miss Sukey Livingston, she told me she had wrote to you by the Post. My dear Nanny, do let me hear from you soon, it gives me great pleasure to receive a line from you. My best compliments await on your mamma and my love to the girls. Tell Cornelia, Lewis desires his best respects to her. Mamma desires you will give her love to your mamma. Farewell my dear Nanny, may we have a happy meeting in New York is the sincere wish of your affectionate friend,

MARY LITCHFIELD.

ELIZABETHTOWN, August 25th, 1776.

Mrs. Mary Litchfield, the writer of these letters, was the young widow of Colonel John Litchfield, of the British army, who died July 14, 1775. It may be a matter of surprise that the widow of a British officer so lately deceased, should write such patriotic letters; but she was the only daughter of Hon. John Morin Scott (the patriotic New York lawyer), the statement of which fact is a sufficient explanation of her warm sympathy with the cause of her countrymen. She was a very beautiful woman, and family tradition relates that in the autumn of 1776 and commencement of 1777 she rendered considerable service, through her father, General Scott, and the General Livingston mentioned in these letters, towards preventing the successful execution of certain military movements of the enemy (especially in West Chester County, New York), by the use of the facilities she then possessed (as the widow of a recently deceased British officer) of acquiring information from a certain circle of loyalists in New York city, among whom she had many personal friends until her true sympathies were ascertained. She subsequently

married Dr. Charles McKnight, the distinguished "Senior Surgeon of the Flying Hospital, Middle Department," who served also as "Surgeon General and Chief Physician" of the American Army.

The "Nanny" to whom these letters were written was Miss Anne Van Horne, daughter of David Van Horne, of New York. She became the second wife of William Edgar, of New York.

"General Livingston" was Governor William Livingston, of New Jersey; and "Miss Sukey Livingston" was probably his daughter (Susan).

"Sukey" was Miss Susan Van Horne (sister of "Nanny"), who became Mrs. Turnbull. "Cornelia" Van Horne (another sister of "Nanny") became Mrs. Livingston. "The girls" were three

other Miss Van Hornes (six sisters in all Mary, Elizabeth, and Catharine, who respectively Mrs. Clarkson, Mrs. Ludlow, Reed. Their only brother was Captain Van Horne, of the Revolutionary Army, frequently known as General David Van H

"Lewis" was Lewis Allaire Scott (one of the writer), subsequently Secretary of State of New York.

"Daddy Cesar" was an old negro who lived until the year 1814, at which time he was certainly over a hundred years of age.

"Mrs. Rodgers" was probably the wife of Dr. Rodgers, of the old "Wall Street Presbyterian Church," New York.

## A BEAUTIFUL AND GIFTED PRINCESS.

BY ELIZABETH G. HALSEY.

ADELAIDE OF FRANCE, the most celebrated and beautiful princess of her time, was the daughter of Rodolf, King of Burgundy. She was born at Bordeaux in the year 943. Gifted from her earliest childhood with rare beauty and remarkable intelligence, her father spared no pains to improve by culture and education those gifts of nature, and she grew up the idol and ornament of the court, at that early period the most polished one in Europe. The fame of her beauty, accomplishments and gentleness, brought her many suitors. Her father left her untrammelled in her choice, and at the age of seventeen she bestowed her hand and heart upon Lothaire, the most powerful sovereign of Italy, who carried his fair bride off in triumph to Pavia, where she was received with the utmost delight and enthusiasm. In the following year she became the mother of a daughter who was named Emma, and who promised to equal her mother in beauty. Nothing now seemed wanting to complete the fair Adelaide's felicity. Idolized by her noble husband and his people, to whose interests she devoted herself, rejoicing in the smiles and endearments of her lovely infant, for three short years she was, as she pathetically expressed it, "too happy for earth." At the end of that time, a brief and sudden illness deprived her of the husband to whom she was so fondly attached, and from that moment misfortune seemed to pursue her.

Berenger, having succeeded in getting posses-

sion of Italy by force of arms, caused her to be crowned King at Pavia, in 964, and the heart-broken widow of Lothaire from that time where her short and happy life had been. Dreading ill treatment for her child, she sought to have her conveyed secretly to a place of safety, but before she could elude the vigilance of her enemies and follow her infant, she was arrested by order of Willa, the wicked Queen of Italy, who kept her for some time a prisoner in her palace, during which time she treated her with the utmost cruelty. She would seize her long and beautiful hair, and drag her from one end of the apartment to the other, kicking and striking her in the face, and loading her with the vilest epithets. Willa was a tall, merciless woman, and the unfortunate Queen, worn by grief and anxiety, was helpless in the hands of her tormentor. She was thrown into a dark and noisome prison, with one faithful attendant who had clung to her in all her troubles, and was permitted to receive visits from her friends in captivity. A monk, to whom Adelaide's days of prosperity had been very kind, was by the account he heard of her persecutions, resolved, if possible, to rescue her. He found means of communicating with her, and arranged a plan by means of which, during a dark night, she and her faithful Bertha effected their escape from their dreary prison.

The night was so dark that the two po-

lost their way and wandered into a morass where they sank nearly up to their waists. Here they remained the rest of the night, and when at length daylight came, they found themselves near the edge of the swamp, which extended down to a river. But worn by grief, ill treatment and imprisonment, these two poor women had not the strength to extricate themselves from their perilous condition; their efforts made them sink the deeper in the mud. Several hours of the day passed, during which Adelaide ceased not to comfort and encourage her despairing attendant, praying earnestly to God for help in this hour of need. Suddenly the Queen spied, at a distance on the river, a fisherman in a small boat, diligently plying his vocation. Raising their voices together they succeeded in attracting his attention. He followed the sound, and came as close to the edge of the swamp as regard for his own safety permitted, and great was his astonishment at finding two women embedded, as it were, in mud and water. He inquired their names, and how they got there. "Do you not see," replied the Queen, "that we are perishing from cold and hunger? Help us first, and then we will tell you our story." The fisherman, touched with pity, extricated them from their dangerous position, took them to his own little hut, where at last they had food, warmth and rest. Meanwhile, the faithful monk, the chief author of her deliverance, was looking for her on all sides. He tracked her to the fisherman's hut, and told her a company of soldiers, wearied by the treatment of Berenger, was waiting on the outskirts of the city to convey her to a place of refuge. Guided by the monk, they left the humble roof which had so hospitably sheltered them, with many thanks and promises of reward, should better days ever dawn, and joined the soldiers who conducted the Queen and Bertha to one of her own castles, which was strongly fortified, and considered impregnable, and where she was warmly welcomed by the Castellan and the garrison.

The dawn had come at last, and our fair heroine was to be once more happy. Otho, King of Germany, had become deeply interested in Queen Adelaide, and having defeated her conqueror Berenger, he besought the beautiful widow to become his wife. She yielded to his earnest and manly love, and they were speedily married. He brought her in triumph to Germany, where the

fame of her beauty, goodness and misfortunes had already preceded her, and where she was received with the utmost enthusiasm by her husband's subjects. Nothing could exceed the happiness of the King nor the delight of the nation when a son was born to Adelaide, and named Otho, after his father. Adelaide bestowed the utmost care upon the training and education of this beloved child, whom she fondly hoped to make worthy of his father, and of the prominent position he would eventually hold among the sovereigns of Europe.

Otho and Adelaide were declared Emperor and Empress in 967, and with increased power and increased means, they sought only the welfare of their subjects. The Empress in particular was indefatigable in encouraging art and science, and in relieving the wants of the poor. But again her happiness was to be short lived. Otho died at Madgboury, in 973, and she was left guardian of her young son, proclaimed Emperor on the death of his father. Firmly, wisely, and yet gently did she hold the reins of the government, to the satisfaction of the nation, and for a time, of her son. But vile flatterers, and evil-disposed persons, always to be found in royal circles, succeeded in getting into the young Emperor's favor and confidence. They persuaded him that he was too old to be governed by a woman, that he was quite able to rule himself, and they never ceased their wicked machinations till they made him feel ashamed of the deference and obedience which he had always shown to his mother.

Adelaide loved her son passionately. He was all that was left to her of her happy married life; but though cut to the heart by his ingratitude, she could not and would not quarrel with him. She therefore resigned the government to him, and fearing that even her presence might become distasteful to him, she once more left her home and took refuge with her brother, Conrad, King of Burgundy, who, with his gentle Queen Matilda, received her with the utmost kindness and affection.

The departure of their good Empress overwhelmed the Germans with grief, while the Burgundians hailed her advent into their country with great rejoicings. It was not long before Otho's eyes were opened to a sense of his filial ingratitude. He drove the detractors of his mother from his court, and entreated earnestly her forgiveness for all the wrong he had done her, and asked his uncle

to join with him in urging his mother to return to the home and country where all were so devoted to her. Adelaide, who had never cherished any ill-feeling against her son, was only too happy to forgive him and return to the land of her love, and continued to be his truest friend and wisest counsellor until his early death, which took place in 983.

His young son was proclaimed Emperor, under the name of Otho III., and his mother, a beautiful Greek named Theophania, was declared Regent. Now Theophania had always disliked the Empress Adelaide, who had tried in every way to win the love and confidence of her son's wife. But Theophania was jealous of Otho's affection and devotion to his mother, and of her unbounded influence over him, far paramount to the wife's influence, yet never used but for the good of the Emperor and his people. She had always been secretly in league with Adelaide's enemies, but so cunning and deceitful was she that neither her husband nor his mother suspected this, though they both lamented her want of affection for the good and generous Empress whom everybody else so fondly loved.

After Otho's death, the revengeful Greek threw off the mask, and again was poor Adelaide the victim of unkindness and persecution. Again she sought shelter at the friendly Court of Burgundy, and her brother, justly incensed at the treatment she had received, swore, that with his consent, she should never return to the ungrateful Germans. But the last years of the gentle Adelaide were destined to be passed in peace. Theophania died after a long illness, to the infinite relief of the nation, to whom, by her exactions, she had become hateful. Her son Otho, then about seventeen years old, wrote at once to his grandmother, to

whose dear image he had always secretly ~~clung~~ and begged her for his father's sake to come ~~and~~ help him govern the people, who were as anxious as he was to welcome her back home. Adelaide's heart had always turned lovingly towards her grandson and the country where she had spent many happy years. In spite of her brother's remonstrances, she joyfully accepted Otho's invitation, returned once more to Germany, where the only revenge she took of her enemies was by loading them with benefits. And now, efficiently aided by the young Emperor, she devoted herself to the welfare of his people. Cities were built, roads made, every branch of industry encouraged, arts and sciences patronized, the poor, and sick, and needy cared for with the utmost tenderness, churches multiplied, and all reverence shown to holy things. One of the favorite sayings of the Empress was, that "no nation can prosper that has not God for its ruler."

The year before her death, she went once more to Burgundy, visited every church and monastery in that kingdom, bestowing gifts upon each one, and then bidding a last farewell to her nephew Rudolph, who had succeeded his father as King of Burgundy, she returned to Germany, but never again to the Court. She had built a very large monastery at Silley on the Rhine, and there she made her abode during the last months of her life, and there, in the sixty-ninth year of her life, this noble Christian Queen and Empress went calmly and peacefully to her rest, lamented alike by Germany and Burgundy, leaving a record such as seldom falls to the lot of woman, of rare intelligence, great discretion, firmness, fortitude, and gentleness; all gifts of God, and used only for the benefit of his creatures.

## LIE STILL!

By MRS. S. M. B. PIATT.

LIE still. You need nor love nor gold,  
Nor name, to make the charm complete:  
The world no living hand can hold  
Falls at a dead man's feet.

LIE still. You climbed for flowers, and found  
They grow not well in highest air.  
Lie still; the rock, the thorn, the wound  
Were yours—you had your share.

LIE still. This is the end, they say.  
Lie still. The peasant and the king,

A little weary, walk this way;  
The bride leaves here her ring.

Your virtues? If the priest speak true  
You need not blush—your face is hid.  
The roses life denied to you  
Are on your coffin lid.

LIE still. I heard your moaning breath  
And counted all your passionate years,  
Yet I must weep myself to death  
That you are done with tears!

## THE FAIR PATRIOT OF THE REVOLUTION.

BY DAVID MURDOCH.

CHAPTER XXX. HUNTING THE LION AND HIS  
TAWNY WHELPS.

ALL being ready, the rude soldiers moved away under the command of their several leaders, a motley and irregular band, at sight of which the well trained and practised smiled. They were like a fleet of Newcastle colliers putting to sea, roaring, tugging, screaming at the full pitch of their lungs, each one in the others' way. The man-of-war's man, fresh from Portsmouth, would turn the quid in his mouth, drawing up the wide trowsers, as he swore an oath at these landlubbers pretending to be jack tars. But after waiting a short time, he sees them all out to sea on their voyage.

Every one of this straggling crew had an individual mind, and every one watched the movements of the Dominie, who at length rode up with fury that he might take the lead in the cavalcade.

"There he goes noo at last," said the impatient Grant, "like another Abrahauum, going after the slaughter of the kings; and literally true is it as the Scriptur says, wi' his armed servants, three hundred and aughteen, pursuing them even unto Dan."

"Do you think," said Salisbury, "that he will bring back his brother Lot and his goods and the women also?"

"Nae saying, nae saying," was Grant's sincere answer, "he is a bauld creature that Dominie, and a stout body till the bargain."

Teunis and Clarence were considered as independent volunteers, and went together with more thoughtfulness than pervaded the company in general, who had not so much at stake. Even the reverend leader joked; Tom whistled what he durst not speak out, and until they got within the line of the enemy, expressed their feelings as they deemed best. After they reached the foot of the mountain, they were ordered to speak less and in a quieter tone. By-and-by the Dominie told them their march must be in silence.

"Down in de belly, spose," Tom said he knew "'hem nigger did dat; could make himself tink two nigger in him at once; one down cellar noder up stair."

"Hold your peace, you scoundrel; now, when I think of it, the forty stripes must come off soon, else we shall have the mountain echoes resounding with your pig squealing."

"Lor' massa, me can't help telling Brandt w'ere massa am if him gib forty save vone dis night; best 'spense wid de forty and gib de one."

"And a good one let it be then," said the Dominie, as he unexpectedly struck over the shoulders of the unsuspecting Tom, who roared out so lustily that there was some fear of wakening up the wild human and bestial.

Clarence and Teunis had made up their minds to go forward and reconnoitre the state of affairs; and there seemed to be no immediate objections to that course. But Grant, to whom they broke their mind, did not exactly relish the movement on the part of two untried men, still wearing the livery of the king. He did not exactly suspect them of treachery, but he deemed it best to be cautious. He said, as if incidentally:

"You will run great risk, callants, only twa o' you among so many Tory Indians. If they catch you they will roast you like a red herring."

"We have planned all that, you see," said Teunis. "I have got on their dress already, and I can easily get a disguise for my friend here. We intend joining them, so that we may be near the girls, should their place of refuge be discovered."

"'Wull to cooper, gang to cooper,' as they say in Fife; but I wouldna disguise my face for all the lasses that ever lilted a strathspey. An Indian garb is a mean looking thing at the best, and I cannot help suspecting the man that puts it on. You maun just excuse me for saying what I do say."

Teunis, who did get flushed in the face at the insinuation, put in here a word concerning his fidelity, and he was conning a speech in accordance with his fiery look, which would certainly have produced trouble, as the hasty Scot only wanted the chance of giving expression to his doubts, when Clarence, with great address, turned the mind of Grant into his favorite theme by asking:

"How that valley down below there would

compare with the scenery of Scotland. You have been up here, of course, in the day time, and can judge."

"Oh, aye, sir, I have been up here hunting wi' the lads that are prisoners down in the toon; and to be honest, I think the size of the country tak's away from the feeling of pleasure I used to hae, when I looked down frae a Scottish mountain."

"But does not that make the sublimity all the more, if there be a sufficient variety of hill and dale, wood and water, interspersed. And then, surely the forest rising up as this does to the very top, must be more beautiful at all times of the year than the bare furze on the Scottish mountains."

"Heather sir, heather is the word. There is music in the very soond o' the word, and as to the sight, I have seen naething here that can stand a comparison with the bloom o' the heather. Oh no, sir; they have nae sangs about the woods up here, nor the streams. I never heard a lassie in this whole land singing the sma'est lilt about the hills and burnies in all this lan'. Man, if you gang up Ben Cruachan, or down the dale o' Aberfeldy, you would think all nature vocal."

"True, true; but then the Scotch are a singing race of people, and they have had such a noble history, it makes the natives glad."

"That's a' true, and finely said," was the answer of the flattered Scot, "frae you that's an Englishman; for nae doubt, you hae been in Scotland, hunting in the Highlands. If you have stood on the tap o' Ben Ledi, you have seen another sight than what you will see the morn at sunrise here; and you will see eneuch here to make your een glance, I'll allow."

"Keeping out of view the associations of the Scottish scenery, where to your mind lies the difference between them?" asked his new acquaintance, who was anxious to keep the good opinion of Grant, who would be a formidable enemy if enraged, or even were he to remain prejudiced, as he was evidently against him and Teunis.

"I think, sir, that the chief difference between what we see here, and that of a Scottish mountain and glen, with all the rest that surround them, lies in the fact that you can take in all Ben Lomond and the loch below, with the islands out, down to Dumbarton, and on to Tintock tap, at ae glance; and it's all grand. But, here man,

everything is on sic a great scale, that I canna comprehend it. My head gets so dizzy I feel as if a' my thoughts had turned into bees. Just this minute, as I'm looking down the dark, my brain is maer like a bike bein' hives aff than anything else. Do you no see something like it yourself, sir?"

"I confess, Grant, that my head is t'ing after all I have seen and heard this day," said the young man, anxious to keep the lieutenant from the subject of Teunis's departure, as he perceived his new friend negotiating the matter with the chiefs; "but if I may guess from what you say there must be a fine uncultivated field for a future poet in that very greatness and mist which meet in the far-off horizon, where the mountain tops just peer through the clouds, and that noble river, running through the centre of the forests are ever living and moving."

"You are very eloquent on what you have never seen yet; but even your description does not come up half to it; and as you say you think it will require some poet like Allan Ramsay to sing about it. At any rate, it will be a lang time before this can compare wi' the hills o' Caedmon's Daunie McGregor there will tell you, that the hills o' Kenmore, where the Yert of Breadalban stands, his house, is as like the Garden o' Eden as a mountain is like that where Noah's ark came out after the flood. Indeed, I doubtna but the carle when he looked frae his crow's nest out over the plains of Shinar, as the folks here do, they look out on that valley where the sun and moon, said that will be a bonny country when it's a' peopled, and growing o'er wi' corn, and the river Hudson there speckled wi' sails. But when that takes place, we will a' be lying beneath the yird; and what the better am I?"

Grant would, with a willing listener, and his present auditor proved to be, have gone on all the morning in the same strain; but Clara, perceiving that Teunis had succeeded in convincing the Dominie of the excellence of his report, allowed him to give his own report, and all the leaders were called together, that there might be a proper understanding in the morning.

"We must fix upon a signal," said the Dominie, "for we have a wily serpent to deal with, and we cannot guard ourselves too well. Shall the word be?"

"The sword of the Lord and of Schunem,"

shouted out the enthusiastic Grant, as if he had made a discovery of perpetual motion and was afraid it might slip back down his throat before he could give it out. "The sword of the Lord and of Schunemann," he repeated, to be sure that he heard it himself. They were about to give a cheer, but restraining themselves said, "Amen; so let it be."

And so the two young men left, careful to bid Grant the most cordial good-by.

"Noo," said that worthy, after they were gone, "it's my opinion that we have not shown muckle sense in that. What would you say if the whole o' that telling of theirs was just a scheme to get up here, where we canna help us? Ane of them is a king's man, we are sure, and the other to my mind is a great deal worse. Baith o' them are in disguise; and a man who will put on a false face for aye thing will do it for anither. It would not surprise me to fin' ourselves corbie's meat before the mornin'."

Some of the young men were so impressed with this speech of Grant, that they offered to ride forward and bring the two scouts back. But this was overruled by the general opinion of their honesty. Indeed, Grant himself did not believe all he said, for he added:

"I took quite a liking to that chiel Clarence frae the first; he tauld such a straught story, and for aye, I am ready to fecht for him, and for his sister, when it comes to blows."

Teunis, having Clarence in charge, felt all the responsibility of a man on whom the success of a great enterprise depends; but so far from sinking under the burden, that he grew stronger, able to endure anything, or to accomplish the most difficult undertaking. He was casting about in his mind the different ways which it might be best for him to pursue, when quick as a flash he fixed on the most perilous—being none else than that through which Elsie had led Miss Clinton two nights before this.

The two young men climbed a tree, so as to get a full view. The sky was lurid, and the din that arose from the camp of Brandt and his allies was ominous of coming war. This, however, was a proof of unconsciousness concerning an enemy approaching. Clarence looked down, with the eye of a romantic youth, as well as of a soldier; and as he saw the fires ranged in a half circle, cut by a deep, dark gulf at the distance, he imagined

a thousand things of which he had read and dreamed of the red man.

Around each fire, men were seen moving like the black spirits of Pandemonium. The few days they had been there had quieted the rude, and made the intelligent more reflective; still there were songs and coarse jests going on, which made the woods ring with their noise.

"Is that high ground we see there on the south?" said Clarence, after a pause.

"Yes, sir," said Teunis, in a whisper, for he knew that sentinels were near. "Your soldierly eye is laying out the battle for to-morrow, but the Mohawk has not left himself without a way of retreat."

"Well for him," said the other, now also under his breath, "for I declare, it makes my nerves tingle to see how easily the whole might be surprised, and put to flight. But how I should like to see all these dusky warriors start up at the sound of the trumpet."

"The war-whoop you mean, sir; but it makes the Dutch blood in my veins curdle when I see these fiends, not soldiers, hiding themselves till the time comes for them to shoot out their fiery tongues."

"You are right, friend Teunis; as I look down, my memory helps me to words that suit the scene before us well: 'It was a place for the habitations of carnal sinners. The winds, full of stiffened voices, buffeted their souls, forever whirling them away to and fro, dashing them, the one against the other.' There is a crowd driven in a body like *dark stars* by a sulphureous blast."

Teunis, who had never heard of Dante, and was in no mood for imaginary description, said in low tones, as if afraid the Mohawk might hear him, "You may distinguish Brandt's tent by its standing in front of all the rest; can you see figures moving?"

"I do," said the young scholarly soldier, replying in the words of the same poet; "'Tis hell, thick smoke carved into images black, yet lustrous; shapes of dignity, they dwell apart.'"

The two young men, descending from the tree, prepared for the morrow. Already Clarence had determined on joining the army of the Mohawk, as the surest way of keeping the dishonorable Clifford in view. But before he could do that effectually, he must change the dress he had on, and obtain, if possible, one of those disguises

which Teunis and others had assumed. He communicated his purpose to his companion, who, though he feared the result, saw in it a boldness, which would if anything, insure it success. At the worst he could reveal himself, and thus claim the protection of the Mohawk.

"You may obtain this," said Teunis, when Clarence inquired for the disguise, "for the king's clink. There are plenty of such garments to be had down there."

"Well, go, and I will remain here for a time; my blood boils and I need sleep to cool my brain; I shall lie down here for an hour or two."

"Not there," said Teunis; "but come with me and you shall have the bed that your sister and Elsie had on the night I told you of."

"None better than that where I can dream of her and of home."

With that, Teunis led his companion to the place of repose already described, which he spread with branches and a fur robe he had at hand, and advised Clarence not to stir till the word of the party was given before sunrise.

They parted with this understanding.

#### CHAPTER XXXI. THE HEAD IN THE LION'S MOUTH.

OUR young Dutchman, left once more alone to his own thoughts, was feeling every moment more heavily upon him the pressure of his responsibility. Everything appeared to depend upon his prudence and his boldness. The young soldier he had just parted with trusted him; the two he had seen in the morning at the falls, were waiting his return at sunrise; to-morrow the Dominic had pledged himself on Teunis's behalf; the mysterious being in the hollow was expecting a visit from him at midnight; Martin, father of Elsie, had begun to trust him; and above all these reasons, was the consideration that Elsie herself had made his fidelity to this good cause the price of her heart to him. Never did he feel till this moment that so much depended upon his faithfulness and wisdom. Under all of these obligations he did not stagger. His foot pressed the ground more firmly at every step, while he moved cautiously, where he knew the sentinels were posted; courageously going forward, he resolved at once to present himself at the camp, and thus ascertain for himself the exact state of things, and of the plan for to-morrow. Veering a little to the right, he heard voices, which made him turn from the path into the bushes, where he lay down. Putting his ear

to the ground, he quietly waited for the return of the party that he knew were near. There were two of them, who came back slowly, like those who had sauntered aside for free conversation.

"I will cover you from all blame, as I am superior. Acting under me, you only fulfill Majesty's orders. Have I not shown you the order of the general, to burn and take all the prisoners, and to do nothing by halves?"

"Mohawk is his own chief," was the prompt answer of the other; "Indians cannot see the mark of the goose's wing. They love the stinging-knife better. Braves cannot be tickled with a feather."

"Captain Brandt," was the hasty reply of the first speaker, "does not doubt my honor." It seemed as if there was some handling of a sword hilt here at this time. "Have not I left you in command at Fort Niagara, at the word of our red race? I have met you here to aid in conducting these prisoners back through the wilderness. Surely that is evidence of my sincerity and of my interest in the success of this enterprise. And now, just when it is about to be crowned with complete success, you threaten to leave."

By this time the two men had become so much in earnest in their conversation that they stood facing each other quite opposite to the spot where Teunis lay quiet: for well he knew that his life depended on his keeping in his breath. Yet he trembled lest the beating of his pulse at the moment would disturb the dry leaves on which he lay.

"Clifford was a great soldier when he was for the Whigs on the sand-fields of the Dutchess. Clifford has all the fort of Ni-a-a-ga-ra in his hand; but the king's great soldiers have broken the hearts when pale squaws come between their eyes and the moon."

There was a sly irony in all this; all the more provoking that it could not be met by an honorable blow.

"Cheeks that smile like the young moon, and bring tears into great eyes," was the still more availing tone of the same speaker. At last the man broke out into fury unrestrained.

"I tell you what, brave Mohawk, that pale squaw must be mine, and if I can buy your help in bringing her into the camp before you leave, there is nothing that the Great King has put in my hand which Brandt may not command."

"The Mohawk cannot be bought with

words; and if he could, his braves are turning their faces to the north star, where their squaws are husking corn, and their papooses singing in their swings."

"Well, I must be content and let you all go," was the infuriated answer. "But I remain till I gain my reward. Good God," said the speaker called Clifford, "am I to be baffled by a sentimental miss, and that Dutch dumpling which Kiskataam says has her in charge. No, I'll scour these woods till my toes are worn to stumps, or blistered as they have been under a Bengal sun, before I yield to this piece of painted flesh."

All this time the speaker was stamping with violent rage on the ground as if he could bring up relief from the nether regions. His comrade for the time was quietly standing till the storm would vent itself; which, like all such gusts, was soon over; and the man who was calling up spirits from the vasty deep, gave it up by saying:

"I can at least control Kiskataam and his foil by the glittering metal."

"Ugh!" was the short interjection of the Indian, "Kiskataam's good hunter for himself. A fawn will leap and play well in his wigwam on the silver water of Ka-na-we-hol-a."

The white man, at this home thrust, which he evidently felt in the tenderest part, could not express himself, but gave out that choking utterance which a man gives when his breath fails him. "I know," said he at last, "that the serpent has tried to crawl into my nest, and all my fear is that he knows too well of the hiding-place where Miss Clinton is kept; and that he only waits to weary us out. But I will die first."

"Miss Clinton! Miss Clinton," was echoed by the Mohawk. "Who is this fawn that the great soldier calls Miss Clinton? The great Englishman called her Fawn."

"Who should she be but the papoose of that rank Whig Clinton, one of the rebel generals? That is prize enough to wait a week for;" and here he bent his mouth to the ear of the Indian—the last word heard was "ransom."

"The Mohawks do not make war on pale-faced squaws. We leave them when the next sun rises."

With that the two went on toward the camp; and as Teunis followed he heard Clifford chiding his companion for his tender heartedness. "Mohawk is a woman. I have a stronger heart than any of you. Delicate women whose veils

were never lifted to man, have begged from me and I have turned away. The valley of the Ganges, wider than the one below, groaning with misery, and putrid with death, did not move me. Under my windows I saw the river Hoogly rolling with corpses; the streets of Calcutta blocked with the dying. The living not strong enough to scare away the jackals and the vultures from the scarcely dead bodies."

All of this was said to impress the Mohawk with the folly of being tender hearted; to which he merely replied with his significant "ugh!"

"Clifford is a great soldier; the Mohawk shall go after the next day is past."

"Go and be ——" as he turned right around, leaving the Mohawk to enter the camp alone, while he plunged into the bushes aside, as if he wished to hide himself from the stars. Teunis only heard "curse him! curse her," repeated till he lost the sound and the sight alike.

The listener justified himself in hearkening to what ought to be counteracted if possible, more especially as he had obtained valuable information for the risk he had run. So making his way as quietly as he could, without appearing to steal in, he found out his brother Anthony's tent, who was there having a command. When they parted in the morning they had an understanding between them that Teunis should make a call at home as he passed, just to see how things "*kaam* on, and help for an hour or so." Anthony was not in the tent when his brother entered, so addressing one who was always known by the shortest part of his name:

"You here yet, Phil? I feared that by this time you would be all away to Niaagaara."

"Nay, nay," said the other pettishly, "dat big soger, has de ooren ov de Indian o'er near his mouth. Budt end vere hast tou been, Teunie? bad talk here."

"What now, Phil?" said the new comer, with well-feigned astonishment. "Where is Broder Anthony?"

The kind-hearted youth, who loved Teunis better than his own life, and who felt all the anxiety of an earnest soul for him, had been out watching for the wanderer, so that he might put him on his guard. Coming merely into the tent door, he gave a signal which brought Teunis out into the dark, where they stood out of sight and hearing.

"Teunie," said Anthony, in a low husky voice,

"thee had best gae home and watch te old folks."

"What now?" said the no less anxious brother.

"What have I done that I cannot be with you at the great hunt?"

"We have no time," was the answer, "to speak of all. Whispers have been going through the camp all day. Awee! awee! for fayther, if the half of this be true, he will shoot you though he die of grief afterward."

Teunis would have entered into his own defence warmly, but the other stopped him, putting his arm into that of Teunis, leading him around, so as to reach the higher point at the south of the camp, where they had the opportunity of seeing all that was going on below. Anthony told his brother to watch the movements of two or three men whom he pointed out. The three figures Teunis soon discerned to be Kiskataam, Shandagaan and Dan De-la-mater, a well-known desperate fellow, who aspired to the hand of Elsie Schuyler, and was thus the decided enemy of Teunis.

"Can you guess what all that means?" was the question put to the transfixed Teunis. "They are searching the tent; if you had been there till this time, your arms would have been tied behind your back. Or a ball through somebody before that could have been done."

"Anthony, I killed a catamount this morning, and I am not likely to let any villain, as all these are, put a cord around my wrists without a struggle."

"I have heard of two catamounts being killed, and am proud that my brother had the power and the skill to kill one of these monsters; but mind you, Teunis, that there are worse creatures than catamounts."

"True, as I see down there. But, Anthony, were as many of these wild beasts to be collected as there are men below, they would sleep quieter, and devour less; and I have been thinking that an animal with a red coat is more savage than one with a dun-colored one. The feet of the human beast are swifter to seek blood."

"Let that alone just now; you better leave before they surround the camp, and rouse up these Mohawk duivels, and you will find them to be a drove of catamounts. We are going out to-morrow to hunt up two Whig women, and you can guess who one of them is."

"For that reason I must remain and protect her against harm."

"You cannot aid her in the smallest manner. After what I saw at the burning of Hoogenhuis I am sure that you will be less able to stand the onset, when the flower of that place is laid on the ground, and trampled upon by ruffians."

"I would send a ball through the man that dares to put a foul finger on that flower of my heart."

"Neither Dan Del-de-la-mater nor Shandagaan will keep away the less that you look gloomy at them. Two men and an Indian for one woman and she a Whig's dochter, must be in these times too many for you."

The tear was rising in the eye of the anxious lover, so that it glistened in the light of the bright fire, and trickled down upon the hand of the kind-hearted Anthony so as to startle him in earnestness.

"In the name of God, Teunis Roe, go; thou wilt get a glimpse of that face in the light of the fire, and a ball will come from some one of the pieces, that never errs. Your eyes are glancing like a deer's at the river side, when pine knots are blazing in the boat. You have shot them in thyself; go, I beseech you."

Almost overcome, Teunis began, "And yet I will be"——

"Oh, Teunis, I know what you would say; and I swear to you, that Whig as Elsie is, and the daughter of a true Whig, that I will protect her with my life, for your sake. Go, Teunis go, and mother's God be with you."

"Swear again, and I will go; swear that you will not let them tie her, nor let Dan put one hand on her, and whisper in her ear that you do all this for the sake of your wandering brother Teunie."

With that the down-hearted youth stepped on the face of the cliff by a natural ladder that had frequently used before, and was no more in danger of missing his foot than by that of his father's barn, so that he was soon out of reach of those hounds who were already on his track. In vain pursuit amidst those rugged rocks and tall trees.

Directing his steps northward to where Dominie's party was lodged, he fell now in their hands from necessity. While the sympathies of his better nature were always with the Whigs, it is doubtful if he would have declared so for them, but from affection first, and now from necessity. Treading his way, as a hunter of game knows how, among loose rocks and underbrush

thick as an East Indian jungle, with not a few of the dangers found in Bengal from American tigers, Teunis moved with his knife in one hand, and his horse-pistol in the other, looking on all sides for enemies. But he had no choice but of escaping thus, nor had he any fear of being way-laid, except as some cunning hunter from above might have descended from the opposite side of the rock, and was lying in wait for his passing by. He disturbed not a few of the wildcats of the place, as he knew from their hissing and spitting

sound, which would have been mistaken for serpents by a less acute sense. His aim was now the spook's den, but ere he could reach that he must come across the camp of the Dominie, where he could not rest in security till the appointed time for meeting the spook arrived. So keeping the north star in his eye, he moved on like the sailor, tacking as he found a favorable breeze. Turning round a jutting rock, avoiding some chasm, or leaping a fallen trunk, he never once lost sight of the point of his attraction.

## WOODED AND MARRIED.

### CHAPTER XXXI. LITTLE FLORENCE.

WHAT do we do in great crises of our life?

How many of us can answer that question? Our friends know, perhaps: as for us, we are stricken dumb with great silence.

Who is this breathing, living, moving being? Is it I? Do I feel all this? Is the clock striking? Am I awake? Is the world just as it was before this morning? By-and-by we shall feel glad, or sorry perhaps; now we look on with blank eyes in which there is a little wonder, perhaps terror; presently we shall wake up, we think, and find it all a dream.

Dym never knew what she felt when that unlooked-for apparition crossed the threshold and drew her on with it. One faint cry she had uttered, half in recognition and half in terror, as that groping touch met hers in the darkness, but now she seems stricken dumb.

Her limbs shook under her, and she leaned against the wall to support herself as the strange bearded figure quietly closed the door and then stooped down to caress the dog that was shivering and whining about his feet. She could not have spoken, only when it turned and held out its hands to her in silence, the girl sprang forward and fastened on them, and her head was bowed lower and lower till it touched the rough coat-sleeve.

He let her stand so for a minute, as though speech was difficult even to him.

"Poor child! I never meant to frighten you in

this way; it was Kelpie's fault; but it was brave of you to open the door."

"If I had only known—Oh, Mr. Chichester!" Dym's voice had a quiver of ecstasy in it now.

"Somebody besides Kelpie has not forgotten me, I see," laying his hand on her hair. "Hush, my child! do not tremble so: it is no wraith, but a real flesh-and-blood Guy Chichester."

"Yes, I know—safe home. I said it—I felt it, thank God."

"Amen," returned Guy Chichester devoutly; but the word was followed by a heavy sigh.

That sigh recalled Dym to herself.

The coming home might be joy to them—a bringing back from the dead—but what must it be to him? and then his mother.

"Come," she whispered, her soft cold fingers closing round his hand and drawing him with gentle force; "we must not stand here; it would kill her if she heard your voice—with joy I mean. They all thought you were dead—all but I—I never believed it. Come." And she led him to the dark library. Guy offered no resistance; he stood by silently, while Dym with shaking hands kindled the lamp she had always kept trimmed for his coming, and then set light to the piled-up logs. She did not rise from her knees till the dry wood spluttered and crackled into a blaze; even by the dim flare of the hall lamp she had seen he was dripping with wet from head to foot.

She stole a look at him now as she rose to her

feet. He was no wraith, he had told her, and yet as he stood in his old position propping his broad shoulders against the mantelpiece it seemed to her that but for his voice she would hardly have recognized him. Was this their Sintram—the Guy Chichester they had missed for so many hopeless years—this tall haggard figure in sailor's dress? The brown bearded face looked thin and sallow and unkempt; there was a sunken weariness about his eyes, and his hair and beard were quite gray; he looked ten—twenty years older.

He turned, and saw her watching him with her eyes full of tears.

"You don't know me, eh?" he said, with something of his old abruptness, only it was sharpened by pain. And as she came closer and put her hand timidly on his arm, as though she wanted the assurance of touch that this was really he, his closed over it quickly, almost eagerly. "Let me hold it a moment; I want to feel the touch of a woman's hand again. Good God! to think I have come to this! so they thought I was dead."

"Humphrey said so, and Mr. Fortescue and I think your mother feared it at last. Mrs. Delaire put on mourning; they were all angry with me because I would not believe it."

"Humph," somewhat grimly; "I feel like a ghost revisiting my old haunts." And then, as though the innocent pressure of the soft fingers soothed him, he said, half smiling, "Then you did not believe it, eh?"

"I could not," the tears brimming over her pale cheeks now. "I never had a doubt till this evening, when Humphrey fretted me. I knew—I was sure—you would come back to your child."

"Ah, heavens, my child!" The hollow eyes gathered a little light now, the hard muscles of the face relaxed. She had touched the right chord.

"She is such a darling, you will love her so," went on Dym, hurriedly; "she has prayed every night for you ever since she could lisp your name."

"My little Florence," shading his eyes with his hand and speaking huskily now; "tell me more about them, Miss Elliott—my mother?"

"She is somewhat ailing," returned Dym, evasively; but there was no eluding those stern sad eyes.

"I have a mother still? you are not trying to

break any bad news to me? Tut! how you frightened me! I saw a light in her window just now—she is ill, then?"

"Very ill; I think the fear you were dead had broken her heart. She has been very weak, and they say she has no wish to rally; she will be better now, only —"

"Only what?"

"She is blind."

"Again? good God!"

"You must not mind; it will be easier to be now; it has all been so wretched. Hark! what that?" as a crashing noise was heard outside. Mr. Chichester listened.

"One of the elms, I expect, has fallen into the carriage-sweep. Ugh, what a night it is! all the storm-fiends are abroad, I think."

"And you came home in spite of the storm?"

"Yes, I had got the home-sickness too strong to wait till the morning. A little extra buffet would do me no harm, I thought; and then I saw the light in her window, and heard Kelpie bark. I knew when the door opened that I should find my little friend on the threshold."

"Kelpie found you—not I—good brave Kelpie."

"I was stealing away like a thief, when a rascal jumped on me; so I have friends still. Well, I never dreamt of this—that I should be glad to come home even without her!"

"Are you glad, Mr. Chichester?"

"Yes, child, yes; I never thought to be so thankful when He gave me back my life; but I am thankful now."

"Why?" she asked, speaking more to herself than to him.

"Why? have I not a child? I have been a poor father, perhaps, but it was the thought of her that kept the life in me, when one after another succumbed. I have looked death in the face more than once, but she has brought me back."

Dym shuddered; he was in the boat's crew all his life; she had found the clue to his gray hair and hollow cheeks; he was gaunt through long years worn by sickness, perhaps; the proud strength within him had given way under such cruel hardships.

"Why do you not take me to my child?" she continued, reproachfully; but Dym shook her head as she touched his wet sleeve meaningly.

"You must not go to her like this; you are wet through, Mr. Chichester. I will wake Stewart, and he shall bring you some dry clothes and some wine."

"I would rather have some food," he returned, shivering, and holding his hands over the blaze; "I have learned to bear hunger tolerably well," with a bitter smile; "but my endurance will not hold out much longer. Do you know I worked my way to Liverpool, and I had only money to pay my railway fare? I have not broken my fast since yesterday."

Dym uttered an exclamation of horror; he was starving, and she had never offered him food. In what a pitiable plight had the master of Ingleside returned!

"Wait a moment," she gasped; she ran down the dark corridor that led to the servants' quarters. Stewart slept in a little room opening out of the butler's pantry. The lad stirred in his sleep as Dym shaded her lamp and called to him.

"It ain't time to get up Miles; it is all that old lying cock," he muttered, drowsily. Dym had almost to shake him.

"Your master has come home—hush, don't wake the others; you must get up directly. I want wine, and food, and clothes for him; he is wet through and almost starving."

Stewart was wide awake after this; he found Miss Elliott loading a tray with food from the larder, and took it from her without a word; his ruddy face was quite gaping and pale, as the gaunt, gray-haired figure in the ragged sailor's dress came eagerly forward.

"Is you the master? I shouldn't have known him. We thought you was dead, sir," burst out poor Stewart, looking round-eyed and aghast. Guy held out his hand to him with one of his sad smiles.

"Miss Elliott took me for a ghost just now. Don't be afraid, my good fellow; you don't know how sorrow and hunger change a man; when I have had something to eat and drink I may look more like myself."

Dym waited on him noiselessly. Once, as she was serving him with something, he took the little hand and carried it to his lips.

"If you knew what it is to me to have a woman's hand about me again," he said, with some emotion. "I think your hair would rise, Miss Elliott, if you knew what I had been

through." And for a long time after that he did not speak again.

Stewart came back by-and-by with an armful of his master's clothes.

"I did it as quietly as I could," he whispered, "but Dorothy heard me and came to the door. I think the mistress is awake."

"I must go to her," returned Dym, rising. "I was afraid of this. Wait with your master, Stewart."

Mrs. Chichester was sitting up in bed. She looked flushed and excited; her white hair had escaped from her cap, and lay in silvery length on her shoulder. Dorothy was smoothing it.

"Stewart has wakened my mistress," said Dorothy, quickly. Dym tried to silence her with a look.

"What can Stewart be doing up here at this time of night, my dear? He was in Guy's room; I heard him. Dorothy would have it I was dreaming, till she went herself to look." Dym stole an agitated glance at Dorothy, but the waiting-woman's iron face was immovable as usual.

"I thought maybe he was walking in his sleep, only he had got some clothes over his arm. You haven't been to bed yourself, Miss Elliott, though it is nigh on an hour since you left us. Folks seem restless to-night," finished Dorothy, who had been disturbed from her own sleep, and was slightly impracticable.

"Is anything the matter? Why have you not been to bed, my dear?" asked Mrs. Chichester, anxiously. Dym was nearly at her wit's end. If Dr. Grey, or even Humphrey, were here, to tell her what to do; she had heard that these sudden surprises were dangerous; and yet Stewart, and the clothes, and her own wakefulness—how was she to account for all that?

In desperation, she went dangerously near the truth: Kelpie was restless; a poor man had taken refuge in their porch from the storm, and the dog had heard him; he was wet through and sadly in want of food, and she had wakened Stewart.

"A fine thing for Stewart to take his master's clothes," put in Dorothy, with a toss of her head; "poor man! most likely a tramp, or something worse. You oughtn't to have opened the door, Miss Elliott; it is not safe; he may be one of the gang. And the master's clothes, too."

"Dollie, what ever makes you so cross to-night? you are making Mrs. Chichester quite ner-

vous with your fancies. He is only a poor homeless wanderer, and quite harmless," finished Dym, with a sudden choke.

"He will come back, my girl." Oh, Will, dear Will, those brave words had come true.

"Maybe the mistress would be easier if I go down and have a look at him myself," returned Dorothy. Dym's agitation had not escaped her. Dorothy watched over her mistress's interest with a grim mastiff-like fidelity. Dym, in spite of her position at Ingleside, had often hard work to combat Dorothy's prejudices.

Dym gave herself up for lost as soon as Dorothy left the room, and then a sudden inspiration came to her.

"You don't think me wrong, do you dear?" she said, as she sat gently stroking the wrinkled hand, and trying to control the trembling of her voice. "Dorothy is very good, but she is hard sometimes; you would not have had me leave the poor man out in this dreadful storm."

"You might have sent him on to the lodge," replied Mrs. Chichester, doubtfully.

"You would not have said so if you had seen him. Mr. Chichester would have told me I was right; he never turned any one away."

A sort of spasm crossed the poor blind face; it was months since they had mentioned her son's name in her hearing.

"Oh, my boy! my boy! If I only knew where they had laid him!" she groaned; and then Dym knew that the hope had faded out of the mother's heart, and that she believed her son was dead.

If she should do harm instead of good! Dym was trembling so now that she could hardly speak.

"I want you to listen to me, dear. I have just heard such a strange story; it made me think of him and Will too. You will try to listen to me."

"I will try; but why did you mention his name? Oh, Guy! Guy!"

"This poor man, the one who is down stairs," went on Dym, bravely, "left his home and all that was dear to him, because a great trouble had almost driven him mad, and he went away and wandered in foreign countries, and over great seas, just as your son has done."

"As Guy did; just as my boy did." And Mrs. Chichester rocked herself to and fro.

"He was so buffeted and tossed about that he hardly cared what became of him; he was shipwrecked, he suffered hunger and thirst, he saw his

mates dying around him, and nothing kept his wretched life in him but the thought of his child.

"His child!" Mrs. Chichester's attention was arrested; she left off rocking herself to listen.

"He had only this dear little child to love him, except his mother, and he hardly knew whether he should find her alive—you are not listening to me, dear," cried Dym, in a sort of agony, as her watchful ears caught the sound of approaching footsteps; they were advancing in the corridor, they came nearer and nearer; was Dorothy mad, that she was bringing him to the very door?

"Not yet! oh, not yet!" she called out beside herself, and flinging her arms around the poor invalid; but the mother's ears were not to be cheated.

"You are hiding something from me. Hark! what is that?" she exclaimed, pushing Dym away with weak arms that suddenly became rigid. "I tell you those are my boy's footsteps! It is Guy! he is not dead—my boy, my boy Guy!" But the shock was too great; the cry of joy died into a hoarse shriek, and as Guy sprang to her side she fainted away.

"Is she dead? Have I killed my mother?" Dym never forgot the white face of anguish with which Guy Chichester asked the question. Dym shook her head as she applied the necessary remedies.

"Why did you not leave her to me? We were wrong all of us," she whispered presently. "I think you had better go away now, Mr. Chichester; it will be safer, much safer!"

"Don't send me away," he implored; "I am here, Miss Elliott, she knows me." And his tears positively stood in Guy Chichester's eyes as the weak nerveless fingers closed around his hand. "You know me, mother, don't you?" he continued; "you know Guy has come back, need I leave you again?"

Yes, she knows him now, as with her feeble strength she creeps closer to him and lays her poor blind face on his breast, "her son that was dead and is alive again." They need not look for her: such happiness seldom kills. Dym stands and watches them for a moment, and then steals softly from the room, beseeching Dorothy to follow her.

"What was that you said, Guy? Tell it again, my boy."

"I promised I would never leave you. You have a great deal to forgive, mother darling."

"No, you must never leave me again, my dear," passing her thin hand caressingly over the rough bearded face; "never again, my son. I think if you had stayed away a little longer, only a very little longer, Guy, my heart would have broken."

Flossie had such a queer dream that night.

She was fast asleep, oh, quite fast asleep, she was sure, when a great bright round star as big as a moon went dancing around her bed and flared up in her eyes, and just as she called to auntie to take it away, some one cried out, quite loud, "Give me the light; I must see her, little Florence! little Florence!" and a tall man stooped over her and brushed her cheek with a long soft beard.

Flossie was quite sure, too, that after this auntie cuddled her off to sleep; but auntie was of another opinion, for as the child opened her dreamy eyes, Guy fell on his knees and called out her name with a sobbing spasm in his throat.

When Flossie fell asleep again it was in her father's arms: the golden head pillowed itself quite unconsciously on the rough coat, the dimpled arm flung itself with a child's carelessness across the broad heaving breast, and so through the long dark dawn, and far into the stormy March morning, Guy Chichester kept watch and ward beside his child.

Flossie was slow in waking the next morning. A pleasant puzzle of thoughts came into her head; a cock was crowing somewhere; there was a great patter of rain-drops against the window; Flossie opened her eyes and began to count them. "One—two—three—four; what a many! I shall never do it; they are all having a game of play, and running after each other. Oh, dear! oh dear!" yawned Flossie.

"That's right; open those pretty eyes, my darling. Gray eyes! just like hers."

Flossie was wide awake now, so why did she rub her eyes again and again? She was not dreaming, not a bit of it. There was the cock crowing, and there were the rain-drops, and, close beside her, there was the same tall man she dreamt about last night.

Flossie was not a bit frightened, so she lay and looked at him—oh an ugly man, with a great

beard that hid his mouth, and rough gray hair, and great sad eyes that seemed familiar to her, perhaps—though he was so ugly; and then Flossie rubbed her eyes again.

"My little Florence, my own darling, do you know me?"

Florence nodded her head gravely, and pursed up her lips; evidently she was not prepossessed.

"Who am I? Speak, my pet."

"I suppose you are papa," shrugging her shoulders, and then speaking confidently,—"*yes*, I know you are papa, though you are not a bit like your picture; and I don't believe!"—patting her pillow rather crossly—"that I shall love you a bit."

"Oh, Flo! Flo! how can you be so naughty?"

"Leave her to me, Miss Elliott," whispered Guy, but his brown face reddened a little; "so young a child is surely to be won. Answer me, sweet-eyes, why do you think you will not love me?"

This puzzled Florence.

"If you are papa, you are not a good papa to stop away so long. Auntie and I have been quite tired of saying, 'God bless dear papa, forever and ever, Amen!' for, oh, such a long time!"

Have you really prayed for me, my precious pet? Has Florence wanted her father?"

"Not much—at least auntie did. She used to cry nearly every day she talked about you. Do you love auntie, papa?"

"Very much," returned Guy, gravely; but it must be owned that he hardly understood the question in the sudden thrill of ecstasy at hearing himself addressed for the first time by that title; it cost him an effort not to snatch the little creature to his breast and devour her with kisses, only he dreaded to alarm her.

Florence smiled, well pleased at his answer. She sidled up a little closer, stealing a small warm hand into Guy's shaking one.

"I think I shall like you, after all. Auntie does; and I love auntie best of all in the world."

"Oh, no; not best, Florence; you must surely keep the best for poor papa."

"Are you poor papa? Aren't you happy? Do you want auntie and me to love you so very much, then?"

"I want you to love me, my little daughter—my heart's treasure—my only one." And forgetful of his resolution, Guy held the fair little face

between his hands and covered it with kisses; and then, as the child drew back startled at his vehemence, he took his seat quietly beside her, and, in an agitated voice, told her, in the language best suited to her childish capacity, that he had been a long way—thousands and thousands of miles; that he had once been nearly drowned in the great dreadful sea; that he had been cold, and hungry, and thirsty; that he had loved her, and thought of his little daughter day and night, and had prayed to God to send him safe home to her. "And now I have come you must try to love me, Honor's dear baby, whom she left as her dying legacy; you will love me for poor mamma's sake, won't you, Florence?"

"She is—isn't poor mamma," returned the child indignantly; "mamma is a beautiful angel; auntie told me so. Were you very cold and hungry, papa? Are you warm now? Never mind, auntie and I will take such care of you."

"And you will love me, my pet?"

"Oh, yes; I don't mind your being ugly now, though your beard does hurt so. Put your head down on the pillow; I can reach you so; there, that is comfortable. One kiss for mamma—mamma told me to do it; and one for auntie; and three from little Florence. And why do you cry, papa? I shall be a great girl soon, and then I shall be quite as good as mamma, you know."

Dym left the father and child together, and, muffling herself up in her water-proof, and only taking the precaution to draw the hood over her bright hair, ran down the terrace and across the garden, and out of the little side-gate leading to the home-farm.

The first burst of mother's rapture, the child's first recognition was over, and Dym's next thought was for Humphrey; Humphrey must know, and no one but she must tell him.

Running down the wet field-paths, battling bravely with the wind and rain, and now and then stopping to take breath, Dym sped light of foot and light of heart till, turning the corner of the farm-buildings, she almost fell into the arms of Humphrey himself.

"What's to do now?—why, what in the name of wonder brings you down to the farm, Dym?" And Humphrey eyed the little hooded and cloaked figure with growing perplexity and uneasiness. "Madam isn't worse, is she?"

"She is better," returned Dym, brushing back her hood, and displaying a pale and happy face; "she is sleeping as sweetly as a child, and as she has not slept for months, Dorothy is sitting beside her, crying out."

"Dorothy crying! You are in a crazy state this morning, Dym. What ever brings you down to the Five-acre on such a morning?"

"There is nothing the matter with me," returned Dym, "I never thought rain so beautiful; I declare, I hardly felt it; and I wanted so to see you, Humphrey."

"I won't hear a word you have to say," returned Humphrey, decisively; "if you don't want to, Dym, I must take care of you. Come into the eaves of the great barn; none of the neighbors will be about; and now tell me this wonderful news."

"How do you know I have any to tell you?" returned Dym, with an attempt at her old smile. "It is not the first time I have come over to the farm to talk to you."

"But it is the first time you have brought such a sort of face with you," returned Humphrey, shrewdly; and indeed Dym's dark eyes were dim with heart-sunshine. "Shall I guess, Dym, what you will have the telling yourself?"

"You couldn't guess, Humphrey, if I tried to try ever so. Stoop your head; I can tell you; it is too good to say out loud. What do you think is at Ingleside, Humphrey? Or what do you think came home last night?"

Dym's whisper broke into a falter, but Humphrey, generally so slow of comprehension, understood it perfectly. He started, and then his eyes were fixed on her.

"Not the squire! Oh, Dym, you mean that!" And a strange shiver of feeling ran through Humphrey Nethcote.

"His very own self, but, oh, such a change! Humphrey, gray-haired and thin, and yet so strong! Will you rebuke me for my faith now, Dym? He told his mother and child that he would come home again?"

"No, no; you were right, and I was wrong, and thank God for it! The squire is home, you say; nay, I am a trifle dizzy, Dym, tell me over again. Why, we thought he was dead—madam and all of us."

"Kelpie and I knew better; it was Kelpie who knew him first, and insisted on my un-

door. Come, Humphrey, you must not look pale over it; you are more startled because you lost all hope, you see."

"Ay, ay, when I see him I shall understand it better. Come away, Dym; why are we waiting? The squire will expect a welcome, of course."

Dym nodded assent, but she looked up anxiously into Humphrey's face as they threaded the wet field-paths again. Humphrey's face was quite blanched with his great surprise, and now and then he bit his lip nervously.

"The squire's come home, and I thought he was lying fathoms deep," she heard him mutter to himself; and then, as though the real truth were suddenly dawning on him, he quickened his steps into a hasty stride.

"Gently, gently, Humphrey!" but for once he did not hear her. Dym's own footsteps became a run, and even then she only retained her place at his side with difficulty; she followed him panting as Humphrey pushed open the conservatory door and advanced to the library; but there the old instinct made them both pause, and Dym timidly knocked.

"Who is there?—come in. What, Humphrey!" Guy put down his child from his knee and rose hastily, and the two men grasped hands in silence.

"Eh, squire! but we have been heart-sick for the loss of you, and the good God has given you back to us." And Humphrey turned aside for a moment, and his face worked with emotion.

"I haven't deserved it, Humphrey," returned Guy, in a broken voice, "any more than I deserve this welcome. I never thought that anything could be so sweet to me again. Look here, dear old friend, my more than brother!" and, throwing his arm over Humphrey's broad shoulder, he drew him to where the child sat watching them with solemn gray eyes of puzzled wonder.

"She is growing like Honor's self. I always said she would, squire; she will be the light of your eyes and the sunshine of your home, before many years are over."

"She has Honor's eyes and broad thoughtful brow; but she will never have her mother's beauty, and her hair is several shades lighter," added Guy, regretfully.

"Mamma is very pretty, but I think auntie is prettier," interrupted Florence. "Why do you look sad, papa? you are not hungry or cold now, you know."

"No, not now, my darling," he replied, fondly, snatching her again to his breast; at least I can bear to endure my life now this one blessing is spared to me. I never thought to say that, Humphrey, till I knew how dreadful the shadow of the valley of death could be."

"Ay, we must all bide till our time comes," returned Humphrey, laconically; but as Florence nestled caressingly on her father's shoulder, the child's golden hair mingled with the squire's gray beard, Dym saw him hastily turn away and brush his hand across his eyes.

#### CHAPTER XXXII. AT BAY.

THE news of the squire's return spread like wildfire through the little valley of Birstwith, and before many hours were over, Ingleside was besieged by friends and acquaintances of all degrees.

The vicar and his wife were the first arrivals. Mr. Fortescue, as he entered the room and heard Guy's cheery, "Well, Lat, how has it fared with you, old fellow?" was so overpowered with emotion that he could only wring his cousin's hand without saying a word; while Katherine, silent and subdued for once in her life, kissed him affectionately, and said, "God bless you, Guy!" and then indulged in a thorough womanly bit of crying.

"Who would have believed Kate had so much feeling in her?" Mr. Chichester observed afterwards, but his own eyes glistened as he said it. Through that day's ordeal the squire bore himself bravely, but Dym noticed his face grew paler and graver, and his lips were often compressed as though in pain, as he listened to his friends' kindly congratulations and warm expressions of joy.

Towards evening the terrace before the house was literally crowded with hosts of the farm laborers, anxious to catch a glimpse of the "Maister, God bless him!"—gray-haired patriarchs of the valley, who had known him as a boy, some of the old almshouse men, with a sprinkling of women and boys, and at the very edge of the group Grace Dunster in her gray duffle cloak, peering anxiously over Deb's shoulder. Guy singled her out at once with a greeting that made the little dressmaker crimson with pleasure; in spite of his fatigue and depression, he had a word and a hand-shake for every one of them; as he left them, a ringing cheer startled the rooks into frightened cawing. "Three times three—that's

right, my men; now you must drink the squire's health, one and all of you; you all know where the squire keeps his home-brewed." And by this judicious hint Humphrey Nethcote rapidly cleared the terrace and grounds for the night. Dym could hear the cheers dying off slowly in the distance. Before long the valley was ablaze with a red lurid light, a huge bonfire was burning on the common. Humphrey called the squire to look at it.

"Poor lads! it is their way of killing the fatted calf. I suppose we must give them a dinner or a supper; you must manage it, Humphrey." And then he sat down by his mother with a sigh, and drew Florence to his knee, and for the rest of the evening he scarcely spoke, except in answer to their questions.

"Ah, but the squire's rarely changed," was Humphrey's parting observation that night; "he'll never be the man he was again." And before many days were over Dym coincided in Humphrey's opinion.

It was true that when the first excitement of coming home had a little subsided Guy became strangely taciturn and silent; he was very reticent on the subject of his wanderings, and evaded as far as possible all inquiries as to his escape from the burning vessel.

"Why should I speak of what causes me such acute suffering only in the retrospect?—you would not sleep to-night, mother, neither should I, if I were to recapitulate all the horrors of that ghastly scene." And Guy's shudder was sufficiently expressive.

"Let the dead past bury its dead," he said, on another occasion, when Mr. Fortescue was questioning him; "don't let us rake up bygones, Lat: it was all a miserable failure from beginning to end—India or Australia, what did it matter? I took my trouble with me. I never got rid of it for a minute—and now."

"Well, Guy?"

"I have brought it back: that is all." And the dark moody look came across Guy Chichester's face as he put down his child from his knee and resumed his old restless walk across the room. But, except when they questioned him about these dreary three years, he was ordinarily very gentle and quiet. It was beautiful to watch him with his mother and child. He would rouse himself from his melancholy brooding to sit by his mother's side and talk to her by the hour together, but it

was evident that his one thought was Florence. He was ill at ease if the child were out of sight even for an hour; from morning to night he was devising little plans for her amusement. Florence's "new papa," as she called him, was her favorite playfellow. Guy's old spark often woke up when he told stories to his child.

Humphrey would meet them on the farm, with hand in hand, Guy's shoulders a little stooped, his head bent, Florence dancing beside him, her fair hair streaming in the wind.

Guy bought a little cream-colored pony and trained it himself; he taught Florence to ride with her great delight. The Black Prophet was cised regularly now. Dym, as she watched from the terrace, was strangely reminded of the days at Lansdowne House, when Edith and Guy used to ride out together.

Edith was growing up now, and was with her mother at Mentone, who had been confirmed invalid; but Beatrix Delaire had said that she might be expected at Ingleside on the course of a week or two.

Guy showed her letter to Dym.

"I hope you have forgotten your old animosity," he said, with one of his old shrewd looks. "Poor Trichy! she has had her share of trouble with the rest of us."

"I think Mrs. Delaire has greatly improved since her residence abroad," returned Dym, unanimously; "she is lovelier than ever, and grown strangely gentle, even to me," laughed little nervously.

"I am glad to hear it; I shall think better of her," was Guy's answer, and the subject dropped. But all that day and the next Dym took her part because the old uneasy feeling had returned at the thought that Mrs. Delaire was coming to Ingleside.

"It is so nice and quiet now, and when she comes she will monopolize him, and he will find time to say a word to me," whispered Jean.

"He will always find time to remember his friends," added Dym's better monitor.

Dym was always taking herself to task for something unaccountable and wholly mysterious. Something was troubling her sweet nature sorely. She was strangely happy and yet ill at ease, and not ill at ease as in Guy Chichester's presence.

Dym told herself sometimes that she was being jealous even of Florence. What if the

and child should become all in all to each other, and she were robbed of her darling? Dym cried shame on herself for this unworthy feeling; but she need not have feared—Florence was true to her old favorite, and often refused to accompany her father for a walk or drive unless auntie were of the party.

"You see Florence has not learned to do without me yet," Dym would say, a little sadly and apologetically, when Mr. Chichester insisted on her accompanying them: "she will be wiser soon."

"When Florence learns to forget her old friends, she will be no daughter of mine," returned Guy, with one of his winning smiles. "Why will you consider yourself *de trop*, Miss Elliott? Do you think that no one besides Florence is pleased to have you?"

It was evident Guy Chichester had not forgotten his old favorite. There was a grave, almost a brotherly tenderness in his manner to her, that ought to have won her from her reserve now and then. He would bear himself towards her as though he felt himself her debtor. It was true the girl had endeared herself to him in no small degree by the filial care and love she had lavished on his mother.

"But for you, she would not be alive to welcome me now, and the sin of having broken my mother's heart would have lain heavily at my door. You have saved me from this last bitterness, Miss Elliott; you have loved and guarded my motherless child for me; and yet you say I owe you no debt of gratitude."

"It was canceled long ago, Mr. Chichester. I implore—I beg you not to say such things. Who was it who first befriended the lonely girl, and made her welcome in your own home? You have been my benefactor and friend ever since I first saw you," continued Dym, in a voice of emotion, and then breaking down altogether.

"Have it your own way," he responded, with a sad smile, holding out his hand; "you may close my lips, but you cannot prevent my feeling grateful to you with all my heart. Put me to the proof, Miss Elliott; see if there be anything that I would not do for your happiness if it were in my power." And there was a look in Guy Chichester's dark eyes as he said this that set the seal to his words.

Such speeches as these filled Dym's heart with a tumultuous happiness that was akin to pain. She would think over them with a beating heart,

as she sat working silently by Mrs. Chichester's side.

She had grown very silent of late, they told her. Dym used to smile at the accusation, but all the time she knew it was true. When Mr. Chichester was in the room she felt strangely tongue-tied—a new sort of shyness oppressed her; she had an odd trick of flushing up when he looked at or spoke to her. Dym could not understand what ailed her; she had lost all her old fearless ways, and yet she only told herself that it was because this long absence had made her friend strange to her.

"I have something against you, Miss Elliott," Guy said to her one day, when they were alone together in the drawing-room: it was the evening when Mrs. Delaire was expected, and the carriage had been sent down to the station. Dym, who had made her toilette early, was kneeling on the rug in the firelight, caressing Kelpie, when Mr. Chichester came in.

Dym rose with a sudden blush, and seated herself in silence.

"Against me, Mr. Chichester!"

"Ay," he returned, with a penetrating glance, as he took his old attitude against the mantelpiece. "I have long wished to ask you something. I want to know what has become of my little friend?"

"I don't understand you!" stammered Dym; but she grew rosy notwithstanding.

"I saw her last on the threshold of the door one wild March morning, when Kelpie scented his master. She was sufficiently benevolent to throw the door wide open for him to enter, but"—with a singular emphasis—"I have never seen her since."

Dym colored high; she was beginning to grasp his meaning.

"What has become of her, Miss Elliott, I should like to know? She had her faults, but want of affection and of candor was not among them. Do you know I miss my little friend every day?"

"She is here!" in a voice barely above a whisper.

Mr. Chichester smiled.

"I don't think so. Miss Elliott, have you grown to be afraid of me?"

"Not very." Dym was crimson now.

"A little, then!"

"I don't know; anyhow, I cannot help it, Mr. Chichester."

He shook his head indulgently.

"Out of sight is out of mind. Fie! Miss Elliott, I would not have believed it of you."

"Oh, no; it is not that," she exclaimed, eagerly, roused at last into defending herself, but stammering still; "I have not forgotten you, Mr. Chichester—how could I? only it is all so strange, and you are altered, and——"

"I am not altered to you"—somewhat pointedly—"and as for the outward man——" he sighed, and then went on in the same gentle tone: "Child, I don't like to see you shy and shrinking from me; somehow, it hurts me. Though my hair is gray, and my heart well-nigh broken, I have still some old affections for my friends; and I ever held you as one of them."

"Oh, Mr. Chichester!" But Dym had no time to say any more; for at that moment the carriage-wheels sounded in the entry, and Mr. Chichester hastened out to welcome his cousin.

Dym was not present at their meeting; but she noticed that Beatrix looked pale and agitated when she came into the room a few minutes later, leaning on her cousin's arm. She greeted Dym with so much kindness that Guy had reason to conclude the old antagonism was dead and buried; and even Dym, who always in her secret heart accused Beatrix of artifice in her simplest words and actions, was not proof against the gentleness that disarmed her.

No one could believe Beatrix was acting a part who saw her that evening. Generally cold and undemonstrative, she was affectionate in her demeanor to her aunt, lavish of caresses to little Florence, while her joy at seeing her cousin again was evidently deep and earnest.

If Beatrix had set herself to charm them all, she could not have succeeded better. Guy, who was generally silent and restless after Florence had gone to bed, now joined the fireside group, and seemed interested in the description of a trip to the Pyrenees that Beatrix was giving her aunt, and now and then he could not help owing to himself that Miss Elliott was right in declaring that his cousin was lovelier than ever.

Beatrix's face and form had always seemed to his fastidious taste well-nigh faultless, though it had been somewhat marred by a repellent haughtiness and a cold searching look in the eyes; this was exchanged now for a softened bearing, and the transparent complexion was now perfectly dazzling in contrast to her deep mourning-dress.

"I believe my poor Undine has found her soul, after all," was Guy's secret comment: "perhaps, after all, she liked Frank more than we thought." And with his old kindliness Guy Chichester set himself to make his cousin's visit pleasant to her.

It was the old mistaken kindness, but it failed to achieve its object.

For some days, more than a week, indeed, everything went on smoothly at Ingleside. Beatrix's white brow wore a peaceful unruffled look that had long been a stranger to it; she made herself quite at home in Mrs. Chichester's boudoir and in the squire's study, she helped her cousin with his accounts, rode out with him and Florence, and already village gossip reported that the beautiful widow would eventually take up her residence at Ingleside. "Ay, she is a rare beauty, but she is not so real bonnie as t'ither were," as one of the old women at the almshouses was heard to say: "she hasn't a glint of sunshine in her face; there's no one like 'the good lady.'"

Guy smiled scornfully when these reports reached him.

"Sland'rous fools!" he muttered. "Do they think I would replace Honor? Poor Tricky! I hope this will not reach her ears: it would annoy her dreadfully."

But it was not village gossip that brought the first cloud on Beatrix Delaire's face: a trifle, a word, had revived the old soreness. One day Dym felt there was an imperceptible change in Beatrix's manner, and taxed all her efforts to discover the cause, but in vain.

"I have not slighted her in any way," thought Dym: "it must be my fancy." But the next day it was there, and the next also.

Could it be that Beatrix resented Dym's position at Ingleside, that she was jealous of Florence's devotion, of her aunt's warm love for her adopted daughter, that Guy's friendship was displeasing to her? "She never liked me to have much to do with him," thought poor Dym.

Dym was half right and half wrong in her surmise as to Mrs. Delaire's changed manner. Beatrix had made up her mind to accept Dym as a necessary evil, and to tolerate her position at Ingleside with as good a grace as possible—come what might, she would not quarrel with her. Guy had his whims, and this was one of them, and she did not choose to incense him against her.

Beatrix was determined to be perfectly good

humored and to patronize Miss Elliott. She personally disliked her—Beatrix always disliked those she had injured—but her repugnance had to be conquered or hidden.

"It is love me, love my dog," she thought, smiling bitterly at her cousin's autocratic ways. "It is a pity he is so foolishly Quixotic. I wonder if he will ever care for a woman after Honor?" And Beatrix sighed as she thought of the strong tenacity of Guy Chichester's affection. For a time Beatrix found her rôle perfectly easy, and then all at once her manner changed.

And why?

Because the widow's shrewd cold eyes had read Dym's innocent secret—the secret unguessed even by herself—and she had determined that at all hazards Dym must be removed from Ingleside.

"If he finds it out, as he surely will, he will only pity her, and—well, no one never knows to what length men like Guy can go; he must never know it, never. If I ventured to warn her in a friendly way—" and Beatrix rose from her low seat, and began pacing the room with troubled steps.

"I think I shall venture it. She will fly into a passion in her old way, and call me her enemy. Are we enemies, I wonder? What made me dislike this girl from the first? If I were superstitious, I should say she crossed my path in an evil day. Honor Nethecode was not specially dear to me, but one was obliged to respect her in spite of one's hatred; but Miss Elliott—" Here Beatrix's uneasy cogitations were interrupted by the entrance of Miss Elliott herself.

Dym came into the room smiling. "Mr. Chichester wants to know if you will ride with him. Florence and he are going over to Ripley; it is such a beautiful day, and—are you not well, Mrs. Delaire?" Dym had certainly some reason in asking the question. Beatrix looked pale and worn; at such times her face would look almost old.

"Yes—no—I am not very well this morning. Tell my cousin, please, Miss Elliott, that I will not ride; give him my love; say I have a fit of the vapors—anything you like."

"If you are dull, shall I come and sit with you?" asked Dym, timidly. Somehow the young figure in deep mourning always evoked her sympathy; instinctively she felt that Beatrix Delaire was unhappy, and the generous girl longed to comfort her.

"Yes, if you like," answered Beatrix, indifferently, but under her cold demeanor her heart was throbbing loudly. Was this her opportunity? Should she speak to her now? She must dissemble and pretend kindness, she thought to herself. In spite of her habitual insincerity, Beatrix felt this thing was not easy to be done.

Dym found her sitting by the fire in deep thought, with her head resting on her hand. As Dym took the seat beside her, she suddenly shivered and moved slightly.

"I am sorry to see you so ill, Mrs. Delaire."

Beatrix smiled bitterly. "I am never ill; have you ever heard me complain, Miss Elliott?"

"You are unhappy, then?" in Dym's softest tones.

"Well, perhaps you are right; something has occurred to trouble me, that is all."

"I am sorry—" began Dym; but Beatrix interrupted her almost fiercely.

"I suppose you would be surprised if I told you that you yourself were the cause of my trouble, Miss Elliott."

"Who? I—I hope—that is, I trust I have done nothing to offend you?" stammered Dym.

There was a strange earnestness and abruptness in Beatrix's manner that startled her, but the next moment it had wholly changed.

"Offended me, my dear Miss Elliott? No, you have only made me think," in a soft melancholy voice. "I cannot help being very sorry for you, that is all."

"Sorry for me!" Dym's cheeks were flaming now.

"Yes; you are so singularly placed, and my aunt is so injudicious—so helpless, I mean. If I were not afraid of making you angry, I think I should try and warn you of something; but I dare not provoke the hasty temper I remember so well, Miss Elliott."

Dym lifted her hot face bravely.

"I hope I have learned to control it now. You frighten me, Mrs. Delaire. What have I done to pain you?"

"Nothing," replied Beatrix, laying her hand lightly on hers for a moment. Somehow Dym quite shuddered away from the cool polished touch. "Why will you persist in thinking that you have offended me, if I am only speaking as your friend?"

"My friend!" Dym could not suppress that

exclamation. A flush crossed Mrs. Delaire's face as she heard it.

"You distrust me still," she said, drawing herself up proudly; "you have never forgotten the old grudge when we were girls together, Miss Elliott. If you will not believe I mean it for your good, at least you know me to be interested in my cousin's welfare?"

"Why do you bring in Mr. Chichester's name?" asked Dym, in a bewildered voice.

"Because what I have to say concerns him closely, Miss Elliott. You will hate me outright, I know, but I must speak. I must warn you that your continued residence under my cousin's roof is perilous to your peace of mind. Don't misunderstand me," she continued, eagerly; "no one has told me—I have found it out myself. Probably you are not conscious of it yourself; but it is as true as the heavens above us, that you are not indifferent to——" She stopped. "Miss Elliott, do you dare affirm that you do not love my cousin Guy?"

At this unexpected and cruel thrust Dym grew as white as death, and her head dropped on her bosom; for a moment she shrank back as though she had received a visible blow.

Beatrix took her unresisting hand gently.

"You need not answer—I can see it for myself. I have always been afraid of this—always. Others have been to blame, not you; you ought not to have been placed in such a position."

The poor white face before her, stricken with sudden shame and dismay, moved even her to pity.

"You must not take it like this, Miss Elliott. Who could be long with Guy without loving him?" and Beatrix sighed. "These sort of feelings come gradually; you were not aware of them yourself."

"I did not know. Oh, this is too dreadful!" suddenly exclaimed Dym. Her innocent appealing eyes smote Beatrix's cold selfishness with tardy remorse; the absolute purity of her look almost inspired her with awe.

"If this were true, and I knew it," went on Dym, with a trembling lip, "you would do well to scorn me: I should not be worthy the name of woman. But I never—never—thought it was that." And a sudden overpowering blush finished her sentence.

"I can well believe it," began Beatrix, soothingly;

but Dym put out a shaking hand and stopped her.

"Please don't speak to me; you mean it kindly, but I cannot bear it. I was going to say perhaps I ought to have known it; but he was so far above me I thought there was no danger; and I had my mother, not even Will, to warn me."

She covered her face and wept passionately; steadfast in her young truth, it never came to her mind to defend herself, to disarm suspicion by a pretence of well-merited anger. "Dare you affirm that you do not love my cousin?" Beatrix had said to her; and the words had brought her own conviction.

Yes, she loved him; she knew it now, innocently as a child, purely as a girl, blindly as a woman. Out of that singular friendship had come the anguish of a hopeless first love; she had dared to love her benefactor. Dym was cowering away from the thought like a frightened dove. One idea was in her mind: Mrs. Delaire was right and she must leave Ingleside.

No one need have envied Beatrix's feelings; she sat silently beside the weeping girl. Her victory humiliated and punished her; in all her life she had never acted so base a part. Miss Elliott had never injured her, yet she was going near to break her heart; she was disturbing the domestic circle she had come to visit; through her means, her aunt, helpless in her blindness, would lose her adopted daughter, Florence, her loving nurse and friend. Beatrix did not wrong the nobility of Dym's nature; she knew she would leave Ingleside; but some word she could say as to her own want of generosity.

"Perhaps I ought not to have said this. Will it make us enemies again, Miss Elliott?"

"You meant it for the best. I suppose you ought not to be allowed to walk beside a precipice unwarned; but I think I could have borne it better from any one else."

"You have always distrusted me," returned Beatrix, icily; "but at least you know I have your cousin's interests at heart."

"I shall not wrong them," was the sad answer. "You need not fear that I shall stay here, Mrs. Delaire; nothing could keep me here now—nothing—nothing!" clasping her hands in despair in spite of herself.

Mrs. Delaire could not help admiring the girl's courage and resolution.

She watched her for a moment, almost enviously; the slight girlish figure, the drooping head, the little dark face that had suddenly grown so wan and wistful.

"I suppose I may go now?" Dym said, turning to the door.

She did not wait for any answer; she almost staggered when a rush of April sunshine met her outside, the sweet spring sunshine that pervaded everything. Down stairs in the hall, doors were opening and shutting; Florence's baby laughter

sounded from the terrace, Guy's grave voice answering, "Run in, my darling; these Northern winds are treacherous," she heard him say.

Dym leaned against the wall, faint and dizzy. Was she never to hear that voice again? was he to miss his little friend every day—always? was she to go away from them all?

"Oh, Will! Will! if I could only die!" groaned the unhappy girl, hiding her face in her hands, and a horror and darkness of despair fell upon her.

## WORD HISTORY.

By HENRY M. DuBois.

THE study of ethnology, or a treatise on nations, has long engaged the speculative student's mind. Fossil remains, implements of war, vases bearing inscriptions of antiquity, utensils of wood and bone have been dug from the earth, thereby unraveling many hidden facts of nations almost or entirely extinct. The fossil remains which have been found on our Atlantic coast mark the far wanderings of some Phœnician tribe. The little that scientific men know of the great advancement of the Celts, who satisfied their progressive ambition by making Great Britain their "Herculean" pillars, was brought about by the discovery of these choice concealed relics. Could we but plow up with the sod the language used by such ancient tribes, what a storehouse of philological truths of their rise and fall would we have; how much more substantial would be our knowledge of their history, than by the few fossil remains containing within their rough exterior some hidden treasure of their weapons, their domestic wares, or some little coin? In no better way can a language hand down to posterity the story of its rise and fall than the words in which their rough wants were expressed. The vehicle which will carry to us the primitive meaning of words, whether used to express rough wants, or refined desires, is etymology, by which certain words have revealed centuries of concealed history.

The best and most authenticated history is derived from etymological investigation. How necessary is it then for every student to habituate himself to the close study of words with which he daily comes in contact. It is essential to a thor-

ough knowledge of all indo-European languages, but especially to our own language, that words should be studied etymologically, as a great writer says: "In a language like ours, where so many words are derived from other languages, there are few modes of instruction more useful or more amusing than that of accustoming young people to seek for etymology, or primary meaning of the words they use. There are cases in which more knowledge of more value may be conveyed by the history of a word than by the history of a campaign." Our words "Frank," "slave," and many others, could be mentioned to illustrate the last truth. In fossil remains, extinct vertebrated animals have been found unknown to zoologists. The graceful fern has been embalmed in its rough stony bed, adding new and rich stores to the botanist; so in most every word used in daily life there lies beneath its rough exterior some hidden treasure of past ages, some beautiful and imaginative thought sufficient to excite a desire for etymological research in the most thoughtless and careless student. How often do we use "dilapidated," and how ignorant are we of its rise. Little have we cared to trace out its etymology, and thereby acquaint ourselves with its whole history. We never can tell until studied that the word was made up of the inseparable Latin preposition *di*, and the noun *lepis*, a stone. How perfectly natural was it for the maker of this word to apply it to some broken-down wall, where one stone fell upon another! What a beautiful sounding word is *sincere*; how carefully it is used! We are will-

ing to attach great worth to it. Yet we remain ignorant of its great beauty until we find it is composed of *sine*, without, and *cera*, wax, as if applied originally to pure honey, free from any wax which would lessen its true value and transparency. So thousands of words could be named which carry out in their etymology the full and natural intention of the first user. What a storehouse of historic knowledge has been handed down in poetry from the archæological periods of the Greeks and Romans to the present time by Homer, Virgil, Shakespeare and Milton. The "Iliad" and the "Æneid" are great, yet not so great in power and beauty as the Greek and Latin languages. "Julius Cæsar" and "Paradise Lost" are valuable possessions of inheritance, but the English language is a more valuable heritage yet. The great historians Herodotus, Livy, and Hume, have conveyed through words the mental treasures of one period to the generations that follow. This precious cargo of historic truth has come to us safely across a rough and tempestuous sea, in which empires have suffered shipwreck, and thousands of unimportant words have sunk into oblivion. What rich and unlimited facilities have these great writers afforded to the student for etymological research! Thousands of words are in our vocabulary whose nicety of derivation is interesting and instructive. A great American writer has said that "language is fossil poetry;" in other words, we are not to study the entire "Paradise Lost" for the poetry, for many a single word contains in its etymology a poetic thought. In our study of this English epic poem we find that the words are strictly poetic in meaning, and not prose. They are purely of musical cadence, not harsh and prosy. Language is "fossil history" as well. It is not necessary to a thorough understanding of this fact that the student must study the entire language of Hume's history. Nay, a few words will suffice to explain pages of drawn out history. How admirably has language adapted itself to its special work!

Prose, the language of history, as often and as effectually embodies historic facts of nations, as poetic words, the language of the poet, embody the imagination or pathos of men. After making this discovery we are enabled to draw nice distinctions between prose and poetic words, which classes of words have heretofore conflicted with each other, consequently making our language inexpressive.

We are not willing to stop here in our logical investigation, for we are just beginning to reap harvests of concealed truths, which will strengthen the feeble elements of our language. The discovery that our language is composed of the two elements, Anglo-Saxon and French, is due greatly to the study of words.

The study of etymology would be very profitable, could the student conceive the great degree of satisfaction which must have accompanied the discovery that all words (with but few exceptions) pertaining to the lower occupations are of Saxon origin, while those of the nobility and higher occupations were of Norman. This discovery we are enabled to draw a line of distinction between the habits and customs of the Normans and those of the Saxons, which in the former tribe were the nobility, but in the latter servitude. How appropriate are the words "mechanic and workman" in illustration of this fact! The former is nicely derived from Norman-French (*mechanique*) through the Latin, while the latter is of Saxon derivation, proving that the Normans invented and constructed all the machinery while the Saxons ran them. One is almost inclined to believe that Shakespeare was familiar with this distinction, for in his "Julius Cæsar" Brutus, the Tribune, higher in station and superior in intellect to the citizens with whom he is conversing, uses the phrase, "being mechanical," while the Citizen, a cobbler, says he is a "workman."

"The frame, the sinews, the nerves, the blood, in brief, the body and soul of our nation are Anglo-Saxon. The Norman-French has added only its limbs and outward flourishes."

Consequently, it is natural for our language to use a greater percentage of Saxon words than every hundred words, counting repetitions, not proper names, Shakespeare's Henry IV. contains 96 of Anglo-Saxon words ninety-six; Hume's History of England, seventy-three; Webster's Dictionary, Massachusetts, eighty-four; Longfellow's Standish, entire, eighty-seven.

From this investigation we are enabled to see that poets employ a larger percentage of Saxon words than prose writers. Some are prone to fly to the Latin language or to Greek for help in the naming of a new thought. They will give to a small and delicate idea a lengthy and unpronounceable word, instead of a graceful and an appropriately derived

word. Such a class of people are attracted to the bigness, rather than to the true and applicable meaning of a word.

The study of etymology has been shamefully neglected in most schools where it has been adopted, and has been grossly slighted in institutions where one would most likely look for it. Why it is neglected by some who have acquainted themselves with it, and by others who have utterly disregarded its importance, cannot be explained. Certainly most every scholar of the English language has felt again and again the necessity of its general adoption in public as well as private, low-graded, as well as high-graded schools. Great scholars have generally decided that the study of etymology is indispensable to a thorough English education. Fortunately the study is not a monotonous one; rather to the contrary, it is amusing and attractive, and opens a wide field for inexhaustible research and study. How often have we had in our possession a piece known to us as a "token," and

how surprised we were on rubbing off the rust which concealed its true face to find it was a valuable coin! So, in words which we use thousands of times, sometimes correctly, and sometimes not, because by necessity and habit we have attached our special thoughts to them. Never have we cared to remove the mysterious garb which surrounds them. We would prefer to live in ignorance of their true value, their true application, than spend much of our time in asking the words which we use to give an account of themselves; to say "whence they are and whither they tend."

May teachers, and those interested in education, who have neglected to teach or to introduce this study into schools, look intelligently into the matter and judge for themselves of its importance! If the ancients had refused to hand down to posterity through history, their customs, habits, and manner of governing, we could, through the study of single words, form a pretty accurate idea of ancient history.

## AFTER A HUNDRED YEARS.—SOME SINGULAR COINCIDENCES.

By JAMES HUNGERFORD.

### IN TWO PARTS.—PART I.

#### CHAPTER I. A DIM MEMORY STIRRED.

SOME years ago my attention was called by an acquaintance to a letter for me in the advertised list—the street and number having been omitted in the address. Since that time I have been in the habit of examining that list as published in the *Sun*, a Baltimore daily paper, every Tuesday morning.

One day, in the early spring of the present year, 1876, after looking over the *H row* in the *Gentlemen's List* for my name, Walter T. Harley, and finding nothing, I turned to the *Ladies' List*, to see if there were any letters for the females of my family. In glancing down the column, my eye was caught by the name of "Miss Honora Brantley Hall."

The last two words of this name struck me as being familiar—Brantley Hall. Why was this? Had I met them before? If so, where and when, and under what circumstances?

So far from being able to come to any conclu-

sion on this point, I could not even recall any distinct memory of the words. And yet they continued to haunt me.

Had not the last two words of the name seemed familiar to me, my attention would still most probably have been attracted by the singularity of the middle word of the three being given in full. Why not, as is customary in such cases, Honora B. Hall? The first word was unusual enough to individualize the owner of the name, even though conjoined with the rather common patronymic "Hall."

These two words, "Brantley Hall," continued for some days to haunt me, as we are sometimes haunted by a tune; and, as a tune thus haunting us will at times recall scenes with which it is connected, so did these words at length not directly indicate, but suggest where I may have met with them.

I may mention here that I am of a family of lawyers on both sides; my father, John Harley, my

father's father, James Harley, and my mother's father, Walter Tolyer, were, as well as myself, members of that profession.

My grandfather on my mother's side was remarkably careful of papers; even when every hope would seem to cease of their preservation resulting in any benefit.

There was in my possession a large box filled with papers which my grandfather Tolyer had thus taken care of; and in that box they were all filed, indorsed, and alphabetically arranged, as faithfully as if he had had cause to believe that he might at any time be called upon to produce them.

My father, although not so particular in such respects as Grandfather Tolyer, had—most probably out of respect for the latter's memory—preserved this box; and it came into my exclusive possession, with the rest of his papers, at his death.

I had since preserved it with the same care; and it was now in safety amid those archives of my office which I had very seldom occasion to refer to.

The suggestion which had been made to my mind, by the frequent recurrence to me of the words "Brantley Hall," was that a clue to their hold upon me might be found in this box. In the days of my studenthood, long before, I had sometimes amused myself by looking over its contents. I retained but a general remembrance that there were some interesting papers among them.

At the close of office hours, on the day when this thought occurred to me, I opened this box and commenced the examination of its contents. Their alphabetical arrangement made this an easy task.

Looking at the file marked with the letter "H," I found nothing to my purpose.

I then referred to the file lettered "B."

The first paper I laid my hand on was indorsed, "Richard Leigh Brantley."

I remembered at once; this was one of the files which had most interested me. "Brantley Hall" was the name of the property which had been in dispute.

I took the bundle of papers home with me, determined to devote the following evening to a re-perusal of its contents. It was not curiosity alone which induced me to this determination; for curiosity alone would not have justified to me the time and trouble bestowed upon the work.

There are times when we seem to be led on,

to and through a quest or undertaking, without the exercise of our own will, and by a power which we do not comprehend and which we make no effort to comprehend.

#### CHAPTER II. A REVOLUTIONARY SOLDIER.

About nine o'clock that evening I was alone in the little room which had been fitted up in the second story of my dwelling for a study; and the file of papers marked "Richard Leigh Brantley" lay on a table before me.

When I had removed the file cover, the first paper which presented itself to me was indorsed:

IN RE RICHARD LEIGH BRANTLEY.

NOTES BY WALTER TOLYER.

The contents of this paper were as follows, the spelling being modernized:

LEONARD-TOWN, ST. MARY'S CO., MD.

*June 5th, 1785.*

Mr. Key, an elderly gentleman to whom I am much attached and who seems to take much interest in me, was to see me at my office this morning. Indeed, he is in the habit of calling on me there very often.

"Poor Richard Brantley is in town," he said, soon after he entered. "Of course you have heard of him."

"I never heard his name before," I replied.

"That is singular," remarked Mr. Key, "as you have been here more than six months."

"There must be something remarkable about the man, then," I said, "since you think it strange that I have not heard of him before."

"There is something very remarkable about him," replied Mr. Key. "He is the undoubted heir to the Brantley Hall estate, one of the largest and finest in the county. This everybody knows—or, at least, no one doubts; and yet his cousin, Thomas Brantley, holds possession of the property, and enjoys it undisturbed."

"How is it possible," I asked, "that such a wrong is allowed in this free country and at this enlightened period?"

"It is an extraordinary case," answered Mr. Key; "but a cause is to be found for it in the weakness and selfishness of human nature in all ages and countries. But, to enable you to understand this general answer to your question as applied to this special case, I must first tell you the history of the man:

"Richard Brantley is the only child of the late William Brantley of Brantley Hall. He was born in 1757.

"When the great excitement swept over the country with the news of the fight at Lexington and Concord in the spring of 1775, he was one of those who felt the patriotic glow. Although he was but eighteen years of age and his education was yet unfinished, so enthusiastic was his desire to fight for the independence of his country, that his father reluctantly yielded to his wish to join the First Maryland Regiment, which was then forming. Having no knowledge of military matters, he enlisted as a private.

"The first service of the regiment was at the siege of Boston. After the evacuation of that city by the British forces, and during the intercourse which subsequently took place between the citizens of Boston and the members of the American army, Richard Brantley met and became enamored of a young lady of that city. The attachment proved to be mutual; and the parents of the young lady, becoming convinced of the young man's respectability and of his assured prospects of fortune, consented to their engagement.

"Richard Brantley was severely wounded at the battle of Long Island in August of the following year; but, by the help of his comrades, he left the island with the remnant of the Marylanders who escaped from that desperate fight. As, from the difficulty with which his wounds healed and the hard life of a private in the army, his health continued feeble, a furlough of some months was granted to him.

"Whenever a chance offered he had written to his parents, and, in a letter sent on obtaining his furlough, he announced to them his intention of going to Boston and fulfilling his matrimonial engagement—to which both his father and mother had consented.

"With much difficulty he made his way to Boston. There he found remittances from his father. His marriage shortly followed. The faithful and affectionate attentions of his wife, and the cheerful circumstances surrounding him, soon restored his health completely; and, before the expiration of his furlough, he found means to rejoin the army.

"He followed the fortunes of the Maryland Line till the close of the war, and took part in the final victory at Yorktown in the fall of 1781. In this

battle, however, he received a terrible wound in the head from a clubbed musket. On account of this wound he lingered long at the house of a kind-hearted and generous planter in the neighborhood of Yorktown.

"His wife, learning of his condition through one of his fellow-soldiers, joined him there. She brought with her their daughter, a child between four and five years of age. Under the devoted ministrations of his wife, he improved; but his bodily health continued weak, and he became liable to attacks of feebleness of mind.

"The devoted services of Mrs. Brantley to her husband, and the influences of a climate to which she was not used, broke down her health also; and, in the spring of 1782, she died of one of those inflammatory diseases to which Eastern Virginia is liable.

"By the aid of the kind planter, his host, Richard Brantley was enabled to return, accompanied by his child, to his native county in Maryland, about a month after the death of his wife.

"Here he found everything changed. His father and mother, whose silence for a long time had troubled him, had been dead more than two years; and his cousin, Thomas Brantley, the next of kin after himself, had entered into possession of all the property which was rightfully Richard's. To this day Thomas Brantley denies the identity of his cousin and holds the estate.

"This account of Richard Brantley's adventures I give to you as received from his own lips; and I have no doubt of the truth of all that he says."

#### CHAPTER III. IN RE, RICHARD LEIGH BRANTLEY.

"Has a suit been instituted for the recovery of the property?" I asked, when Mr. Key had concluded his narrative.

"No," was the answer; "nothing at all has been done to restore to Richard Brantley his rights."

"How is it possible," I exclaimed, "that such an injustice should be allowed to exist so long—now three years—in a Christian land, in a country that has shown its hatred of wrong, and its refusal to submit to it by a seven years' desperate war?"

"It is no doubt due to the fact," answered Mr. Key, "that, where the rights and wrongs of others alone are concerned, human sympathies are apt to be sentimental instead of practical. Richard

Brantley, although not thirty years of age, looks like a broken-down old man. His intellect is feeble. In fact he looks more like an object of contempt than of pity. His cousin, on the contrary, is a man of fine appearance and very popular manners. Moreover, Thomas Brantley has plenty of money, and Richard Brantley lives mostly upon charity. People do not like to make an enemy of Thomas; notwithstanding his pleasant manners, he is known to be a relentless enemy. The miserable appearance of Richard—feeble and in rags—suggests defeat; the stately and healthy bearing of Thomas, aided by the dress and the surroundings of wealth, seems to assure success. Moreover, Richard Brantley, instead of trying himself to do something practical about the matter, goes around whining about the injustice done to him, to every one who will listen to him."

"But he has right on his side," I said, indignantly; "and he has fought for his country through all her struggle for independence. But for his devoted patriotism, indeed, his misfortunes would not have occurred. Has he ever tried to employ a lawyer? Surely, even though no member of the bar can be found to volunteer for the sake of justice, some one would render his services, in so righteous a cause too, for a large contingent fee."

"The lawyers have been like the rest of the community," replied Mr. Key. "What is everybody's business is nobody's business? Some of the younger members of the bar have sometimes entertained a notion of undertaking the matter; but, as I said before, nothing has been done."

"I wonder if Richard Brantley will intrust the business to me?" I asked.

"Undoubtedly," answered Mr. Key. "But, by undertaking it, you will arouse the enmity of a man possessing great power by means of money and an indomitable will, and of all persons over whom he has influence. Still, if you win the case, you will break down his power and influence, and will have done a most righteous deed. Success would, also, add immensely to your prospects at

the bar. But I fear that you will find the against you too mighty to be overcome."

I was young, and I think I may add, had enthusiasm and some chivalry in my composition. I was, therefore, not at all dismayed by the tales which Mr. Key suggested. Before he left my office it was arranged that he should see Richard Brantley and send him to my office in the afternoon.

At about half-past three o'clock the same day I was aroused from a pleasant after-dinner nap by the entrance into my office of a man who was to be in feeble health, and nearly, if not past, sixty years of age. He carried a small package under his arm, and led by the hand a very pretty little girl.

"Is this Mr. Tolyer?" asked the man.

"Yes, sir," I answered, rising from my seat.

"Mr. Key told me, sir," he said, "that you wished to see me. My name is Richard Brantley."

I immediately offered him a chair, and led the little girl in another.

I was agreeably disappointed in Richard Brantley, in one respect, at least. His face had a weak and half-vacant expression which I had expected to see. His eye was bright, his expression earnest, and his bearing manly.

Both he and the child were respectably dressed. Their clothes were plain, his perhaps rather shabby, but the appearance of each was neat.

"Mr. Key told me, sir," said Mr. Brantley, soon as he had taken a seat, "that you are desirous to undertake my case. He said that he had already made you acquainted with my history."

"He has," I replied; "and I am much interested."

"I have brought you," he said, putting his hand on the package, which he had placed on a table near him, "some papers which will serve, I trust, to satisfy you of the justice of my claim. Some of them already existed, and others were procured in accordance with the advice of Mr. Joshua Jones, a young man who once thought of undertaking my case, but who soon gave it up; I do not know why."

## NOTES AND QUERIES.

**Dreams.**—The writer would esteem it a favor if the Editor of *POTTER'S AMERICAN MONTHLY* could furnish him with some data or groundwork from which at least a plausible interpretation of dreams can be made. The nature, causes

ness. If by these our correspondent can define dreams, he deserves congratulation. The subject itself is one which strictly belongs to the domain of mental philosophy, and always has excited and doubtless always will awaken a

JOSEPH DREAMING.

and significance of mental visions while in the state known as sleep, have caused much discussion, and from it all, but little which appears logical has been gained, and the subject is still enveloped in a mystery. In olden times dreams, notably in the case of Joseph, took the form of visions, and revelations of the most remarkable character resulted from them. No doubt many readers of your valuable periodical would, like your correspondent, appreciate light on this curious subject.

E. J. H.

While we do not claim to be able to give entirely satisfactory information on what has puzzled the brains of the greatest thinkers and writers of all ages, we may add a ray or two of light upon a theme naturally associated with dark-

Vol. IX.—5

personal interest. The very prevalence of dreams claims for them consideration; for few persons there are, or ever have been, but have had dreams of some kind. Locke, however, tells us of an individual who never dreamed till the twenty-sixth year of his age, when, with a fever, he dreamed for the first time. Plutarch also mentions one Cleon, a friend of his, who lived to an advanced age, and yet never dreamed once in his life, and remarks that he had heard the same thing reported of Thrasymedes.

Undoubtedly these persons dreamed very seldom, as we find that some dream much more than others; but it is possible that they may have dreamed at some time and entirely forgotten it.

In giving an explanation of dreams, our attention is first

arrested by the circumstance that they usually have an intimate relationship with our waking thoughts. Upham in his "Mental Philosophy" says: "The great body of our waking experiences appear in the form of trains of associations; and these trains of associated ideas, in a greater or less continuity, and with greater or less variation, continue when we are asleep." Condorcet (a name famous in the history of France) told some one that, "while he was engaged in abstruse and profound calculations, he was frequently obliged to leave them in an unfinished state, in order to retire to rest; and there the remaining steps and the conclusion of his calculations have more than once presented themselves in his dreams." Franklin also has made the remark, "that the bearings and results of political events, which had caused him much trouble while awake, were not unfrequently unfolded to him in dreaming." Mr. Coleridge says, "that as he was once reading in the 'Pilgrimage of Purchas,' an account of the palace and garden of the Khan Kubla, he fell into a sleep, and in that situation composed an entire poem of not less than two hundred lines; some of which he afterwards committed to writing." The poem is entitled "Kubla Khan," and begins as follows:

"In Hanadu did Kubla Khan  
A stately pleasure-dome decree;  
Where Alph, the sacred river,  
    ran  
Through caverns measureless  
    to man  
Down to a sunless sea."

It is evident from these examples, which are confirmed

by our own experience, that our dreams are generally fashioned from the materials of the thoughts and feelings which we have while awake. So well understood is this, that Dr. Edwards, who was distinguished as a mental philosopher, thought it a good practice to take particular notice of his dreams, in order to ascertain from them what his predominant inclinations were.

But while we are to look for the materials in our dreams in thoughts which had previously existed, we find that they are not beyond the influence of those slight bodily sensations, of which we are susceptible even in-hours of sleep. Dugald Stewart relates an incident which may be considered an evidence of this: "that a person with whom he was acquainted, had occasion, in consequence of indisposition, to apply a bottle of hot water to his feet when he went to bed and the consequence was that he dreamed he was making a

journey to the top of Mount Ætna, and that he found the heat of the ground almost insupportable." Baron Trelat relates, "that being almost dead with hunger, when confined in his dungeon, his dreams every night presented to him well-filled and luxuriant tables of Berlin, from which they were presented before him, he imagined he was to relieve his hunger." "The night had far advanced," Irving, speaking of the voyage of Mendez to Hispaniola, but those whose turn it was to take repose were unable to sleep from the intensity of their thirst; or if they slept to be tantalized with dreams of cool fountains and

brooks." Thus we enlarge upon the action of the mind in an unconscious state of space, however, enable us to condense our thoughts and contract those of

It should be borne in mind that there is a wide difference between a dream and a vision. The former, as stated, is traceable to instances to internal or those things which connected with our life; the latter is put from external cause has little or nothing with the condition of the body or the themes have engaged our attention. Few persons have vision the sense used here, which most everybody has. A vision in the religious sense, is that mind which sees an actual real the object, much physical eye does the of the MONTHLY. Observations show dream character of a vision ence supplies much in

JOSEPH RELATING HIS DREAM.

tion concerning both phenomena; yet the latter is largely wrapt in mystery.

**Curious Links.**—Thinking that the readers of your able Magazine might be interested in the almost marvellous connections sometimes made between two or more lives, the great lapse of time which is sometimes bridged by the dawn of one existence to the termination of another, am induced to furnish the enclosed items gathered from authentic sources. We owe so much of this knowledge to tradition, that it is well for us now and then to inquire into the minor details of the subject; it is of such investigation that we can properly comprehend the character of the people who lived in the earliest ages of the world. Your department of NOTES AND QUERIES is

ing and instructive. "Prophecies on Sneezing" in number, and "The Odd Family" in the June issue, won for the Magazine many friends. May not tribulation on "Curious Links" be accepted as evinced my appreciation of your most worthy periodical?

THEODORE H. JOHNSON.

Dr. Chambers, in certain papers, gave some instances of the manner in which distant ages may be connected by the lives of individuals—for instance, a man may have spoken to another who had been living at the time of moving historical events more than a century ago.

One subject is one that may from time to time be interesting to the public. The circumstances which have passed in the life of a single long-lived individual are sometimes of wonder to the young. The late Lord Lyndalton lived till 1868; yet he had seen the birth, growth, and fall of the republic of the United States of America, he was born in Massachusetts, at a time when that and the other States were British plantations or colonies. In the last two years of life he had seen the whole history of the republic. In 1874 died Paymaster Thorne, the naval officer in the Queen's service; for he received a commission in the days when Lord Nelson was still fighting, and conquering. Still more remarkable was the life of the late Field-Marshal Viscount Combermere; he was a commissioned officer in the British army in 1791, and a retired officer he was in 1865, when death carried him off at the age of ninety-two. During his passage through military grades from ensign to field-marshal, he had been versant with the wars relating to two republics, two empires, and several monarchies in France. Most notable of all, Combermere and the great Napoleon had both died in the same year; the one (English) in 1805, the other (French) as Lieutenant Bonaparte in 1804. Napoleon has been dead more than half a century. When George IV. visited Edinburgh in 1822, he was interviewed with one of the men who had fought for Charles I. in 1745; the king pleasantly welcomed him as "one of his enemies." One Mr. Evans, who died in 1869, went to speak of having witnessed the execution of Charles I. in 1649; but this assertion is sadly in need of confirmation.

Two aged persons are concerned, the one born before the death of the other, a much longer space of time to be bridged over by a retentive memory. James Oglethorpe, born in 1744, and surviving till 1844, was the son of a man who was born in 1657, during the reign of Cromwell. James, therefore, in the present reign of Victoria, could talk of his sire having been contemporaneous with the stirring events consequent on the death of the first Charles. If these dates are correct, James must have been more than eighty years of age when he was born. Mr. and Mrs. S. C. Hall, travelling in Ireland in 1840, were introduced to a man who could tell them that his father had been at the battle of the Boyne, a hundred and fifty years before, when a boy of fifteen; this was possible if the father was (say) seventy-five when the son was born, and the son was sixty at the date of the interview. The Earl of Arundel, in 1787, narrated that he had conversed with a man who had witnessed the execution of Charles I. In 1823 a man from Coventry stated that he had dined with the son of the Young Pretender, Prince Charlie. This connecting of the two periods was thus explained.

Stolberg had a daughter, Louisa, who married the son of the Earl of Arundel in 1773, when he had become a middle-aged man; an interval of eighty-five years between the birth of Prince Charlie and Mr. Coventry; yet the latter had dined

with the Princess Stolberg, when she was a venerable dame of ninety. Lord Torphichen, living in 1862, had an uncle who was an officer in the royal army in 1745, fighting at the battle of Prestonpans; and another uncle who, as a boy, was concerned in a so-called witch adventure in 1720: facts which seem to show that the Torphichens were a tough old race. James Stuart the architect, known for his classical knowledge as Athenian Stuart, died in 1788, at the age of seventy-six; he had a posthumous son born in that year, and this son lived to be Commander Stout of the royal navy, who was living till 1861, if not later; the father and son between them thus covered a hundred and forty-nine years at the least.

The following are further instances belonging to the same class. In 1713 a venerable matron was living who might, in one sense, have been called a niece of Mary, Queen of Scots. It arose thus: Francis II. of France was the first husband of the hapless Mary, he being at the time of the marriage, in 1558, fifteen years of age, and known as the Dauphin; he became king in the following year, but died after the reign of only a few months. His brother succeeded him as Charles IX. in 1560, and had a natural son, to whom the title of Duc d'Angoulême was given; this king died in 1574. The duke's widow lived on to 1741, when she died in extreme old age. She, therefore, survived her father-in-law by no less than a hundred and thirty-nine years; and as Francis and Charles were brothers, she was therefore, a kind of step-niece of Mary, Queen of Scots. In another instance, a gentleman living in 1872, was the son of a person born in 1722, the two thus bridging over a hundred and fifty years between them. If the father was (say) fifty-five when the son was born, and the latter lived to the age of ninety-five, this would fulfil the conditions. Maurice O'Connell father (we believe) of the great agitator died in 1825, at the advanced age of ninety-nine; in his youth he had known an aged man named Daniel McCarthy, who had been present at the battle of Aughrim in 1691—a man had seen a man who had witnessed an event a hundred and thirty-four years before the decease of the former. The Countess of Loudoun, widow of the third Earl, was born in 1677, and lived to be almost exactly a hundred years old; she was attended professionally by Dr. John Mackenzie, who survived till 1841. In this case, a medical man, in the reign of Victoria, could say that he attended a lady born in the reign of Charles II.—covering the reigns of eight intervening sovereigns. Dr. Routh, President of Magdalen College, Oxford, held his presidency to the day of his death in 1854, when he had entered upon his hundredth year; when a young collegian, he knew Dr. Theophilus Leigh, who had been Master of Balliol College at the time when Addison was an Oxford student, about the year 1695. This was a clear leap of more than a century and a half covered by two learned men during their academical career. Sir Stephen Fox, born in the first half of the seventeenth century, had a family by his first wife; and one of his sons was Paymaster of the Forces in 1679. He survived his wife and all the children; married again at an advanced age in Queen Anne's reign; had two more sons; and one of these sons became the father of the celebrated statesman, Charles James Fox. The statesman, therefore, just before his death in 1806, might have said: "An uncle of mine was a member of the government a hundred and twenty-seven years ago."

The case of Commodore Pickernell was another remarkable one. This tough old sailor, who died in 1859, at the age of eighty-seven, knew in his youth an old man who could tell of having been encamped as a soldier on Hounslow Heath at the time of the Revolution in 1688. When quieter days came, the soldier played as a bandsman at the coronation of Queen Anne; and next served throughout the Duke of Marlborough's campaigns. There is something a little startling about these dates; but, as Pickernell was

barely eight years old, and the veteran a little over a hundred, when they met, the difficulty may be solved by supposing that the soldier was very young (say a drummer-boy) at the time of encamping on Hounslow Heath.

A distinct series of these curious phenomena is presented when *three* persons are concerned in transmitting the record. Mr. Ramage, in 1872, communicated to one of the journals the following: "When I was a boy, I was acquainted with an old woman named Margaret Clinch, who lived in a cottage within the Drumlanrig domain, at a short distance from Drumlanrig Castle. She had in her youth been in attendance on Catharine Hyde, the wife of Duke Charles of Queensberry. Duke Charles was born in 1698." Thus a gentleman writing in 1872 could say that he had seen a woman who had seen a man who was born in 1698; the space of time included being one hundred and seventy-four years. William Oldys, the learned bibliographer, who died in 1761, had known a lady who connected him with Waller the poet, born in 1605. The facts and dates stood thus: When James II.'s younger daughter was still Princess Anne, and he still undisturbed by the Revolution of 1688, one of her maids of honor was a daughter of Sir John Talbot; she paid a visit to Waller when he was eighty years old; and she herself, when a venerable widow, Viscountess de Longueville, was visited by Oldys, at that time a septuagenarian. Mr. Frank Buckland, writing to *Land and Water* in 1872, stated that Dr. Routh of Magdalen College (whose name we have already had occasion to mention) had in his youth seen an old woman who in her youth had seen Charles II. walking in Oxford with his favorite spaniel. There seems, however, to be one intermediate life omitted here; for in a notice in the *Times* of Dr. Routh's death, in 1854, we learn that "he had been told by a lady of her aunt, who had seen Charles II. walking with his dogs in Oxford in 1605." There were thus *two* ladies and Dr. Routh to connect the widely-distant dates. Mr. Buckland mentioned another case, of a friend, Mr. H—, who told him that when ten years old he used to sit on his grandmother's knee, and listen to her account of what took place in 1745, when she was eleven years old; that she was at that date residing at a farmhouse in the western part of the county of Durham; that some of the adherents of the Young Pretender passed that way; that she assisted her mother in succoring them with bread, cheese, beer, and other refreshments; and she recollected that the poor fellows fell on their knees and thanked in Gaelic their kind hostess. Now Mr. H— had a daughter born in 1868; if she lives to the age of eighty, she will be able to say: "My great-grandmother fed some of Prince Charlie's troops more than two hundred years ago."

Dependent on a similar number of lives are some other instances which deserve brief notice. The Scottish newspapers in 1766 recorded the birth of a child to Lady Nicolson of Glenbervie; her husband, Sir William, was ninety-two years old at the time, having married his second wife when he was eighty-two; there was an interval of sixty-six years between the birth of his first daughter by his first wife and his youngest daughter by his second wife. We have no record of the death of this youngest daughter, but supposing her to have lived beyond her eightieth year, she might have said in 1846: "My father was born a hundred and seventy-two years ago, in the time of Charles II.; and my eldest sister was born a hundred and forty-six years ago." This case was a specially remarkable one, in one at least of its features. More within the ordinary run, but still noteworthy, was the instance of Dr. Franklin, who was the grandson of a man born in the time of Queen Elizabeth; Benjamin Franklin himself died in 1790, and thus he, his father, and grandfather, covered two centuries. About the year 1539 was born Miss Lettice Knollys, who eventually became by marriage Countess of Essex in 1556, Countess of Leicester in 1578, and Lady Blount in 1589. This courtly lady, who

did not quit the scene of life till 1634, was a great-granddaughter of Anne Boleyn, and might, very probably, as a little girl, have seen Henry VIII.; she certainly saw Edward VI., Mary, Queen Elizabeth, James I., and Charles I. She belonged to a family very retentive of life; for her father reached the age of eighty-five, one brother eighty-six, another ninety-nine, and herself ninety-five. Another lady was in a position to say, shortly before her death in 1858: "King Charles II. was present at the marriage of my grandfather, and gave away the bride nearly a hundred and ninety years ago." This leaping over a wide gap seems rather startling; but the facts and dates arrange themselves in the following way: James, the fifth Earl of Carras, was a naval officer in the service of Queen Anne, and had come to the earldom as successor to his father, the fourth earl; Charles II., near the close of his reign had given the bride at the first marriage of this fourth earl; years of birth and death of the two noblemen we do not take account; but Earl James's daughter Elizabeth, Countess of Hardwicke, and survived to a very advanced age in 1858.

It has been pointed out that when George IV. ascended the throne in 1820, the self-same decorations of the Order of the Garter which he then received, were those which had been worn by his ancestor, Charles II.; and it was a remarkable fact that there had been only two intermediate holders in that long period. Charles II. conferred the Order on the Duke of Somerset, who retained them till his death, at an advanced age in 1748. They were then conferred on the young Prince of Wales, at that time a boy of eleven or twelve years of age; he retained them for no less than seventy years, twelve as Prince, and sixty as King George III., which they passed to his eldest son, George IV. The Duke of Somerset and George III. between them held the Order of the Garter uninterruptedly for a hundred and forty years. The most unusual degree was the duke a participant in the ceremonies wherein stars and garters are more or less worn; under no less than six sovereigns in succession for he was one of the pall-bearers at the funeral of Charles II., the bearer of the orb at the coronation of James II., the bearer of the queen's crown at the coronation of William III., the supporter of the chief mourner at the funeral of King William, the bearer of the orb at the coronation of Queen Anne, again its bearer at the coronation of George III., and once again at that of George IV.

With regard to the historical value of these remarkable leaps over wide intervals of time, it may be well to remind that the fewer the intermedia, the persons concerned in handing down the testimony, the less likely is the record to grow untruthful by repetition. On the other hand, if the chain is long, they are exposed to the influence of defective memory, and old age. When a garrulous old man talks about the events of his youth, he is not always reliable as to dates, though honestly intending to speak the truth. Nevertheless, making all necessary deductions, these phenomena of memory are certainly worthy of attention.

**O'Brien, the Giant.**—Can the Editor of *FOUR AMERICAN MONTHLY* give any information concerning O'Brien, the Giant? There exist accounts widely at variance with each other in regard to him. History is valuable as it records truth, and to your popular periodical I offer a search of light upon a subject in which many are interested.

CHARLES W. LANE

In compliance with the request of our correspondents, we are able to give the following pertinent to O'Brien, the words of a correspondent to a foreign journal:

I have been reading the account of the great giant O'Brien,

and the discussion as to whether the bones of this huge man rest peacefully in his grave, or are standing in the attitude of Mr. Pitt in the Hunterian Museum. Five-and-thirty years ago I was pupil to Mr. Richard Smith, the senior surgeon of the Bristol Infirmary. Mr. Smith at that time was the oldest hospital surgeon in England, and by long marks the merriest, and during his long tenure of office (fifty years, I think) had collected the finest provincial pathological museum in the country, and he is still well remembered in his native town as a skillful surgeon, anatomist, antiquary, and local historian. Mr. Smith knew Patrick Collier O'Brien well, and not long before he died, about the year 1843, he told me the following story. I will give it to you as nearly as I can in Mr. Smith's own words: "They tell you in London that they have got the skeleton of O'Brien in the College Museum, but they have not. They have got O'Byrne, a smaller man. Why, O'Brien was *Sit. zin*. If anybody could have got out his body it would have been myself. He was buried, sir, in the porch of the Roman Catholic Church in Frenchard Street. He had a great horror of being dissected, but I was determined to have him, and took a house (or intended to take a house) on the other side of the street, that we might dig a tunnel under the road and remove him quietly. But we found he was buried in a grave sunk deep in the red rock, and the stone over him secured by strong iron bars, so that we could not run a mine to him without blasting with gunpowder, so we gave the plan up. And here he lies; and if anybody ever tells you that they have got him in London, you tell them that he would have been in Richard Smith's museum if in any museum at all." He also told me the early history of O'Brien, stating that a gentleman had seen a great raw youth blubbering in a public house, which he could not leave, as he had not the means of paying his score; that he learned that the youth had arrived from Ireland to be exhibited as a giant, had quarreled with his exhibitor, and was left penniless; that the gentleman took compassion on him, paid his debts, persuaded him to set up on his own account; that he did so, in the public house in Temple Street, long known afterwards by the sign, the Giant's Castle; that when he retired from public life he proved himself a quiet, simple, inoffensive man, as all over-big fellows are; that he used to walk about in the evenings when the darkness favored his escape from notice; that he went almost nightly to the theatre, when he sat in the farthest back row in the boxes. The Giant's Castle, I well remember; it is pulled down now, as everything else interesting in dear, dirty old Bristol has been pulled down to make room for improvements. The days I refer to were the old days when the study of anatomy was followed up by stealth in more ways than one, and the pickaxe and shovel were as much a part of an enterprising medical student's instrument list as his box of scalpels. Body-snatching was then, too, frequent, and Mr. Smith, in his young days, had the honor of being fired at by a militiaman from a barrack window overlooking a churchyard, under the impression that he was a ghost hovering over a newly-made grave. So the idea of driving an "adit" under a street road to get at a body would not have been thought so outrageous a thing then as it would be now. Moreover, all collectors have been, are now, and ever will be, thieves (make a note of this, please), and if it had been practicable at any price, Patrick Collier O'Brien would be now standing erect in the museum of that most cheery, kind-hearted surgeon and determined collector, Richard Smith.

**Jehovah and Baal—A Historical Curiosity.**—In 1788, a clergyman, who was vicar of a parish in Shrewsbury, England, ordered the removal of a picture of the crucifixion which had long been suspended in his church, and which he

believed was regarded by some as an object of worship. On the day following its removal, the Roman Catholic priest issued the following lampoon, which was circulated over the whole town:

"The parson's the man,  
Let him say what he can,  
Will for gain leave his God in the lurch:  
Could Iscariot do more,  
Had it been in his power,  
Than to turn his Lord out of the church?"

It may be easily supposed, that on one part of the community this would have its effect; but the worthy vicar soon gave evidence that he possessed wit as well as his neighbor, for he immediately replied:

"The Lord I adore  
Is mighty in power,  
The only one living and true;  
But that Lord of yours,  
That I turned out of doors,  
Had about as much knowledge as you.  
  
But since you bemoan  
This god of your own,  
Cheer up, my disconsolate brother;  
Though it seems very odd,  
Still, if this be your god,  
Mr. Burley can make you another."

**The Watch and Sword of Captain John Rush, of Cromwell's Army.**—Benjamin Rush, Esq., of Philadelphia, on the eve of his departure for Europe by the Cunard steamer *Scythia*, recently, deposited in the National Museum, at Independence Hall, several ancient relics, which will be examined with interest by all classes. The most important of these is the watch and sword owned and used by Captain John Rush, a cavalry officer in Oliver Cromwell's army. Captain Rush was a personal friend of Cromwell's, and one day when Rush's horse came into camp riderless, Cromwell, fearing the worst, sadly exclaimed, "I had no better officer in the army." Captain Rush, however, was not killed, as naturally supposed, but lived still longer to vigorously wield the sword which is now on exhibition. The weapon is long, straight, and narrow, being what is commonly known as a "cut-and-thrust sword," and shows many marks of hard usage. Here and there can still be discerned faint stains of blood mingled with the rust of centuries, and the scabbard was long since rendered useless by time and exposure, the weapon being over two hundred years old. The watch, which is believed to be of much greater age, was manufactured by Richard Trap, of London, and in general appearance much resembles the old bull's eye of less ancient times. It is in two parts, the outside case being detachable. In 1683 Captain John Rush left England and came to this country with his family, and his fifth heir in lineal descent was Dr. Benjamin Rush, one of the signers of the Declaration of Independence. The present owner of the relics, Benjamin Rush, Esq., is the grandson of Dr. Benjamin Rush, thus being the seventh in lineal descent from their original possessor.

## CURRENT MEMORANDA.

**The Oriental War.**—Independently of the vast numerical superiority that Russia can bring into the field, she can now fully reckon on the coöperation of Roumania, whom geography has placed at her discretion; of Servia, Bosnia and Montenegro, whose accounts with the Porte are not yet satisfactorily settled; of Greece, whose armaments have been for months carried on with undisguised ostentation; of Crete, where anarchy is rampant in town and country, and insurrection openly organized; of Persia, which has been treasuring up grudges for years, and cloaks her ambition well; and finally, of the disaffected subjects of the Porte throughout the empire, all of whom, Christians in the European provinces and Mussulmans in Asia, especially in Syria and Arabia, and even in Constantinople, reckoning the rabble which was yesterday gazing, with undisguised delight, at the lowering of the big two-headed stone eagle from the top of what was so lately Ignatieff's home—all of whom, we say, unite in their intense feeling of hate to the overbearing Osmanli, and look to the struggle, which has now become imminent, as an opportunity for the gratification of their long pent-up vehemence. Were Turkey's ruin decreed by fate, she would be sure to fall without a friend, for nothing can be more hollow, more skin deep, than the attachment which many of the self-styled Turkophiles whom interest binds to her fortunes profess to feel for her cause.

For their own part, the Turks, beside their regular army, which even the Russians reckon at 500,000 combatants, and the Bashi-Bazouks, who thirst for blood and plunder, can swell their force to almost an indefinite extent. Besides their position on the Danube, unequaled in strength for defensive purposes, and besides the command of the sea, which insure them easy communication between their two main armies, they seem to set no limits to their imagination when they conjure up the auxiliaries which Mohammedan enthusiasm may muster in the field under the banner of the Crescent. We hear of Kurdish chiefs calling together the nomad tribes of the desert and preparing to come to the rescue with 150,000 horsemen. We hear of Egypt, some of whose battalions are still encamped in the Bosnian or Albanian districts, arming and equipping a fresh contingent of 25,000 men. Equally zealous in his duty as a vassal of the Porte is said to be the Bey of Tunis, and lavish both of his men and money. He of Tripoli alone, it appears evinces a lukewarm, if not actually unfriendly, disposition toward his Suzerain. What more? Yakoob Khan, of Kashgar, who one hears has enough to do to keep off the Chinese, is expected to be able to spare the Sultan 50,000 of his Turkomans; and, as to the Mussulman multitude which is to flock here, no one can say by what route, from British India, it is something positively baffling calculation. Many days will not pass before these auspicious dreams fade into thin air, and the Turks see themselves confronted by sober and stern reality, for, independently of the madness of relying on the aid of wise warriors of the desert, or on that of ambitious and disaffected dependents, were even all Asia and Africa to

supply the men, one does not see whence the Porte could draw the means to support such vast hordes. No doubt her own soldiers will fight well, and her fortresses will hold out with great firmness; but the want of organization and good leadership, and the exhaustion of her means will soon tell against the Ottoman armies in the open field, and, upon any serious reverse overtaking them, the discouragement which has already seized the Government will soon extend to the much-enduring countries.

**Our Patriot Dead.**—Among the customs which have been legalized by the American people through their representatives, none is more expressive or touchingly beautiful than the annual decoration of the graves of those who fell in the late war. It is expressive of appreciation and love for the memory of the once heroic souls who buckled on the armor for the unity of the nation—that though they died the nation should live. Father, son, husband and brother, endured the toilsome march, sickly camp, lonely picket, and shock of battle in defence of the Union one and indivisible. The battle-stained ensign is made more sacred because it was moistened with the blood and pierced by the shot of that memorable conflict. To keep green the memory of the noble spirits who forsook their homes, families, peaceful and pleasant pursuits, to uphold the Stars and Stripes, we believe, is one day in the year dedicated to consecrate the last resting-place of the dead. Here may we, as a nation, deck the spots, gather a new inspiration and inculcate in our children with a deeper love for their country and the priceless boon of civil and religious liberty. Not impart to us of hatred to the living or fallen foe; but in a broader show that the god of battles gave victory to the right; that slavery, the blight of the nation, was through the struggle to perish forever from free America; that the South represented our misguided brothers through early training and education; that they felt and believed they had been wronged by the North, and sounded the bugle's blast for what they conceived were their rights, their property and their honor. In this spirit should we teach the lessons of the war. To say to the South, you fought manfully for a wrong cause, and with us now mourn over the loss of the loved ones now sleeping the last long sleep. Say to them, now citizens of a common country—we give you the warm grasp of the hand across the graves, and unite with you in beautifying and blessing the green sod where repose the heroic dead, with you we moisten the soil with our tears, and pledge anew our devotion to the Union; with you we will make the air resonant with garlands in memory of those who have gone "down into the valley of the dead." Thus in charity and brotherly love, may this day of all others be made more instrumental in uniting closer together the hearts of the two peoples; this day be one grandly commemorative of reunited hearts as well as States, under the constitution and the laws.

The gray and the blue here and there repose together,

in silent, both mourned. Let us obliterate the lines and creases which divide them; permit our own hands to strew the grave with flowers, and allow the sun, winds and dews of heaven to kiss these evidences of our faith, hope and unity.

We are glad to note that this spirit is growing; that a fire to bury the bitterness engendered by the war is becoming general, and that the time is near when we shall be no more of a North or a South, and that the bloody war will only be spoken of in sadness and sorrow.

In harmony with these views are those of the Honorable Henry W. Watson, delivered at Nashville, Tennessee, recently. They show such a broad love of country that we feel sure the readers of the MONTHLY will thank us for bringing them here as reported to the press:

The war is over. It is for us to bury its passions with its dead; to bury them beneath a monument raised by the American people to American manhood and the American ideal, in order that "the nation shall, under God, have a birth of freedom, and that the government of the people, by the people and for the people, shall not perish from the earth." There is no one of us, wore he the one cloth or the other, come he from the granite hills of New England or the huge groves of the Mississippi valley, who has not an interest for himself and for his children in the preservation and perpetuation of our republican system. It is a reciprocal as well as a joint interest; and, relating to the greatest of human interests, it ought to be a sacred interest. The most obstinate partisans, the most untravelled of provincials cannot efface or obscure, still less dispute, the story of heroism in war, of moderation in peace, which, written in letters of living gold, will blaze forever upon our national tablets. The Union that brings us here has this significance: it is illustrious; it tells us that we have come to understand that we could be no lasting peace nor real republicanism but any freeman's right was abridged or any patriot's life unhonored. The freedom of each and every State, each and every citizen, is at length assured; and there remains no longer so much as a pretext why the glory of the past, marked by the graves of all who fell in the battle, should not be the common property of the whole people. The old feudal ideas of treason do not belong to our times or our epoch. Their influence in public affairs, far as they have influenced public affairs, has been hostile to our national unity and peace. Our future is to be secured by generous concessions, for ours was a war of mistakes, of disgraces.

History teaches us that wars are more or less the subjects of misconception and mischance. It is rare, indeed, if ever, when all the right is on one side and all the wrong on the other. In our case, and I take leave to speak for both sides, we have much to deplore—nothing to make us ashamed. Surely the world has never seen terms so liberal extended to soldiers beaten in civil broil, or known such abstinence from sanguinary revenges during the progress of the strife. It is necessary to remind no one of the conduct of Grant and Sherman in the moment of their triumph. The conflicts of the present hour cannot shut out from the hearts of grateful men the spectacle of that dismal day, when rising above the mounds of victory and the ruins of the conquests, the chiefs of the armies of the North remembered not merely that they were soldiers and men of honor, but that they were Americans. It was our Lee who paid the honors of war to our Kearney. When the body of Morgan was borne to its resting-place soldiers of the Union, assembled by chance in the public square in Nashville, stood, soldier-like, unmoved as their fallen adversary passed. When McPherson's death a thrill of sorrow went along the whole Confederate line.

I believe to-day that the assassination of Abraham Lincoln is lamented in the South hardly less than in the North.

That which is wanting in us is less of self-love and more of love for our country; a deeper, sincerer devotion to the principles of civil liberty which are bound up in the system under which we live; a self-sacrificing spirit where the honor of the nation is at stake. To sectionalism and partyism we owe our undoing. We shall owe our restoration to Nationalism, and to Nationalism alone. The man who was a Confederate, and is a Nationalist, must feel when treading the floor of Faneuil Hall that he is at home. In every part of the South the starry ensign of the Republic must be not only a symbol of protection, but the source and resource of popular enthusiasm. Above all, the cabin of the poor man, whatever his color, race or opinions, must be a free man's castle. In the North, constitutional traditions must revive; in the South, the old inspirations of the Union.

The South, more especially the young manhood of the South, yearns for national fellowship. It stretches out its arms to the National Government beseechingly; it entreats the North not to build up a national spirit which shall in word or thought proscribely it or those who are to come after it. The present generation of Southern men is in no wise responsible for the acts of the last. It has no antecedents except those which illustrated its sincerity and its valor on the battle field, its fidelity to its beliefs, its fidelity to its leaders, its fidelity to itself. These are but so many hostages of the nation at large. Instead of stigmatizing it, the victor in the fight should throw over the South the flag of the republic; should place in front of it the emblematic eagles of the State; should fold it round from the dark and the light with the instinct of maternity, tenderest of its crippled offspring. To the young men of the South the country must look for the resurrection of the South. They should carry no dead weights either in their hearts or on their backs. The work of physical liberation, which is happily ended, is to be followed by a greater, a grander work—the work of moral emancipation. A sagacious statesmanship, even more than a generous magnanimity, points to this as the hope of the white man and the black man; the real restoration of the Union; the true solution of the problems of life and labor raised up by the mighty vicissitudes of the last fifteen years.

War or no war, we are all countrymen, fellow-citizens; and it is no mawkish sentiment or idle rhapsody which seeks to bring us nearer together. The day of the Sectionalist is over. The day of the Nationalist has come. It has come, and it will grow brighter and brighter, dotting the land, not with battle-fields, but with school-houses in which our children, instructed better than ourselves, will learn to discern the shallow arts of the self-seeking demagogue, who would thrive by playing upon men's ignorance and passion. We have seen within the last few weeks, how a little generosity in the fountains of our political existence has warmed the hearts of men and elevated the tone of public affairs. This tells us simply but truly that party lines are not, and ought not to be, lines of battle, separating men committed to deadly strife. That which I plead for, which I have pleaded for all my life, is that we shall be governed in our public interests by the same fair-minded and self-respecting principles of conduct which good men bring to their private walks and ways.

Fellow-soldiers of the Union! I cannot close without thanking you for the opportunity your generosity has given me to speak in this place, and on my native soil, for your country and my country, for your flag and my flag. The Union is indeed restored, when the hands that pulled that flag down come willingly, and with full hearts, to put it up again. I come with a full heart and steady hand to salute the flag that floats above me—my flag and your flag—the flag of the Union—the flag of the free heart's hope and home—the star-spangled banner of our fathers—the flag that, uplifted triumphantly over a few brave men, has never been obscured.

destined by God and Nature to waft on its ample folds the eternal song of manhood, freedom to all the world, the emblem of the power on earth which is to exceed that on which it was said the sun never went down. I had it in my mind to say that it is for us, the living, to decide whether the hundreds or thousands who fell on both sides during the battle were blessed martyrs to an end, shaped by a wisdom greater than ours, or whether they died in vain. I shall not admit the thought. They did not die in vain. The power, the divine power, which furrowed the land with battle-fields, sowing it deep and broadcast with sorrow, will reap thence for us and for the ages a nation truly divine; a nation of freedom and freemen; where tolerance shall walk hand-in-hand with religion, while civilization points out to patriotism the many open highways to human right and glory.

**Reform.**—From the press, the pulpit, and the rostrum, reform is still agitated as necessary for the healthy growth of our civil, social, and political life. During the great presidential contest reform was the song of the politician, the inscription on the banners, and the rallying cry in the marts of trade and at the social circle.

Now, all this is well enough so far as it goes. But may we not put the following queries: 1. What has the agitation thus far disclosed? 2. What substantial good has it accomplished?

To the first inquiry, it is too evident to be successfully combated, that the cry for reform revealed a most lamentable state of morals not only in all the departments of the general government, but in every avenue where capital, talent and labor were struggling for position, power, or influence. Especially glaring were the violations of trusts both of a public and of a private character. There loomed up to the public gaze the revolting spectacle of individual pledges trampled under foot, sacred promises violated, and a general indifference to verbal or written contracts, except where they promoted selfish interest or personal aggrandizement. The good old maxim "honesty is the best policy," was spurned as the product of some old foggy, overly conservative, and too stupid to comprehend the demands of the age. The great tidal waves which seemed to sweep from the lakes to the gulf, and from the Atlantic to the Pacific, carried on their breasts but one proclamation, so easily understood by the multitude, and that was "Get money, my son, honestly if you can; but get it any how," for with it you get all else that heart or mind can covet.

In this motto there appeared much to allure, especially the young men just starting out in the world in pursuit of success. These young brains and hearts could only see and feel the influences which wealth gives; they lacked that mature and better judgment which surveys the future, and comprehends the true foundation of happiness. The precepts gathered by the young generation were swept aside by the whirlwind of fashion and love of display. More potent than these were the few examples of older heads, which loomed up suddenly from poverty and obscurity into the dazzling splendor of marbled palaces with their velveted couches and glittering chandeliers, though at the expense of honor and even honesty itself.

These young men, developed into manhood during and since the war, have not been blind to what has been too plainly written on the walls, not only in private dwellings,

but more conspicuously in public buildings, sacred offices, legislative halls, and even in the temples of justice. They saw that *money was king*, that there was much truth in the statement "that every man had his price," and that from the brilliant career of James Fisk, who, from a tin pedler became in a few years the "Prince of Erie;" from the obscure small saloon keeper, the ruling power in the city and of New York, was William Tweed, who, for a time, rolled in his chariot as the owner of millions, as well as of legislators who moved and voted at his beck. Nay! they saw more. They witnessed the heads and fronts of charitable institutions, where were deposited hundreds of thousands of dollars, betray their trust, and pocket the hard earnings of the widow and the orphan. They looked upon ministers of the Gospel using their sacred offices to fleece the confiding members of their flock, and then winging their way across the ocean to a country with which our government had a reciprocity treaty, that they might there, undisturbed, enjoy their dishonestly accumulated riches. They read even of broken faith in Life Insurance Companies and savings banks, millions gathered from the hard-working masses only to enrich the scheming and confidence winning managers. All these are disclosures no less prominent than humiliating to us as a people. They are not precepts, but examples which have poisoned and still are poisoning the minds of the young men who are to succeed as in representing the nation. They are revelations which have furnished us the dead-crop of business, stagnated our cramped capital, and caused general distrust everywhere.

To the second inquiry: What substantial good has it accomplished? it may be safely affirmed, that the old landmarks are being looked after, finger-boards which guided in the past, and by which we must be guided in the future, if we would return to enduring prosperity.

This agitation has also taught us that slow growth is the only permanent and enduring growth, whether as applied to individuals, nations, or the world of vegetation. Only he who honestly earns money can appreciate its value or know its worth. The sudden acquisition of wealth, like that of knowledge, brings no lasting benefit, as a rule, to its possessor. The true worth of money is rather to be measured by the amount of toil in an honest calling given in exchange for it. We see this truth illustrated almost every day. The young man who inherits vast possessions, and controls money without restriction, generally rushes into some of the many forms of dissipation, and in the majority of cases is of no special value to himself or to society at large. The cry for reform has for its foundation all these and many more of the existing evils. We have departed from the wholesome methods of achieving success, and not till we return to first principles can we reasonably expect to turn the tides of business in our favor. Civil Service reform will come as a logical sequence to individual reform in business and at home.

**The Permanent Exhibition.**—The national character given to the "Permanent Exhibition" as it is styled by the managers, renders it not inappropriate in these columns to make some record of its doings, management, and prospects. While the Quaker City will receive the largest share of the

honor for the enterprise, and also the chief portion of the financial benefits of the "great show," we should not lose sight of the broader idea that the Exhibition in itself reflects an ever-increasing lustre upon the public spirit of the American people as a whole. It shows to all the world the masculine vigor of the American mind, the ability and willingness of our representative citizens to grapple with and control ponderous subjects, and to carry to a successful issue projects from which the more feeble and vacillating minds would shrink. It holds aloft the central fact that our country is prolific in her bold and daring spirits, who, ever looking forward for victory to crown their labors, press onward regardless of hedges, and what to others would be considered insurmountable obstacles, until the end is consummated. Faith in a most worthy cause brought the eyes of all nations to centre on Philadelphia as the seat of the Centennial Exhibition, and now this Permanent Exhibition and its management can scarcely fail to redound to the lasting honor of the leading spirits engaged in it.

The formal opening was a precursor of success. The President of the United States, ex-President Grant, members of the Cabinet and many distinguished persons from abroad—including Governors, Senators, Representatives and eminent citizens of foreign nationalities as well as our own—by their presence sanctioned the enterprise. The Main Building of the Centennial Fair was dedicated just twelve months after the great Exposition, in a most imposing manner, in the presence of more than twenty thousand persons, at the conclusion of Oliver Wendell Holmes's choral, "Angel of Peace." The Exhibition is now complete in all its departments, and may well be considered the most gigantic show of human skill, ingenuity, art and industry, ever permanently established through individual capital and talent.

**War Movements.**—The latest information from across the waters leads us to believe that the calm between the opposing forces is only like that which precedes the storm; the quiet and secret movements of the Russian army herald but the clash of arms and roar of artillery at an early day. The skirmishes now and then, here and there, are but feints to develop the strength of either side. The reports to the associated press seem to point to an union of the centre and right wings of the Russian army; that those of the former had advanced on the passes of the Soghanlu Mountains, and the latter on Olti and along the Choruk valley. There must now be added the fact, that the Russian centre has obtained communication with the left wing, so that the Eastern heads

of passes between the Soghanlu and Kiretch ranges, near Midshiner, are already in their hands, Mukhtar Pasha having withdrawn from his position between Olti and Bardez and taken up a fresh line between Kaprukoi and Hassan Kaleh. Mukhtar has thus improved his position, if he has sufficient force north of Erzeroum to check the advance of the Russian right wing. This, however, is very doubtful, especially as his position at Kyllly, south of the Araxes, is threatened by the extreme left of the Russian left wing. A portion of the Russian left was detached at Jeranos, probably with the desire to turn Mukhtar's strong position at Kaprukoi, on the Araxes, for the descent from Soghanlu through the passes leading down to the valley of the Araxes is steep and difficult, as indeed is also the descent from the Kasher range to Kyllly, which is about half an hour's march from the Araxes. If the Turks stand their ground, which they can only do if they have sufficient men guarding the northern approaches to Erzeroum, the plain of the Araxes will be the scene of a sanguinary battle. The great length of the Russian lines of communication, with the two fairly garrisoned fortresses of Kars and Batoum in their rear, necessitates great caution on their part; because if the Turks had sufficient enterprise or available forces they would long since have sent large reinforcements by sea to Batoum and endeavored to break through the circle which the Russian iron corps has been forming on the heights around the land side of that town. A vigorous effort in this direction might yet save Erzeroum. The Turks appear to be learning rapidly this fact, and some reinforcements have been ordered to Batoum.

While all this is going on, other complications and rumors point to a possible popular outbreak at Constantinople, in favor of the recently deposed Sultan, Murad; to plots and counterplots in France by the two wings of the ministry. The *Republique Francaise*, of Paris, Gambetta's organ, says: The Senators of the Left have determined that the Republicans, though they do not fear a dissolution, ought to neglect nothing which they may properly do to prevent it.

The *Ordre* says the Duke de Broglie has received a deputation of Legitimists, who demanded that the Ministry be remodeled according to the views of the Royalists. M. de Broglie replied that President MacMahon had no intention of asking for a prolongation of his powers. He would retain his office until 1880, but not hold it beyond that term, and thus close the door upon hopes which were justified by the Constitution. The *Ordre* adds that President MacMahon subsequently confirmed the Duke de Broglie's statement.

## LITERATURE AND ART.

**The State of Michigan: Embracing Sketches of its History, Position, Resources and Industries. Compiled under authority of the Governor in the interest of Emigration.** 8vo, 136 pages. By S. B. McCracken. Published by W. S. George & Co., State Printers, Lansing, Michigan. This publication is one among the many reaching us designed to preserve in shapely form and style much that is

valuable concerning one of the most prosperous States in the Union. While it is not an exhaustive treatise of anything in particular, it furnishes a great amount of information never before embodied in book form. We think, however, not sufficient prominence is given to the subject of Fruit. Those at all familiar with the wonderful fruit-producing power of Michigan will agree with us in this criticism. Our Centen-

nial Exhibition gave ample evidence also of the richness of this State in the species, abundance and variety of her fruit products. On page 37 it is stated that the area devoted to orchards is no less than 237,098 acres, and that the apples, peaches and pears yielded in one year numbered nearly 6,000,000 bushels, yet the subject only receives a passing notice. Still, it would not be possible to say much on any one thing, where so many are touched upon in so small a space.

The author in his preface says: "The object of the publication is to present in brief outline the position, resources, industries, institutional character, and other general features of the State, embracing so much in its history as may serve to introduce it to the reader, for the information of persons who may be looking for places of settlement or investment. The project of the work had its origin with the State Centennial Board of Managers, but being so directly in the interest of emigration, it seemed to come legitimately within the power conferred upon the Governor in that regard, and it has been done under his authority. The work was one for which there was no precedent, and the style and method of which could not exist clearly at first in the mind of the compiler, but had to be wrought out, and in a measure created. Sources of information had to be sought out, and much labor was necessarily done before any visible results were produced, and in some cases work, over which much time had been spent, had to undergo remodeling to adapt it to the developing character of the work as a whole."

The general appearance of the compilation—for such it is, more than a treatise—reflects credit upon both the author and publishers. The paper is of good quality and the type clear and distinct. The title-page is faced by a fine lithographed view of the State Capitol at Lansing, followed by an excellent railway map of the State, and three very attractive engravings, full-page size, showing the State Public School at Coldwater and the Michigan Asylum for the Insane, at Kalamazoo; one page exhibiting the male department, and the other the female department of the institution.

**Report and Collections of the State Historical Society of Wisconsin for the years 1873, 1874, 1875, and 1876, Volume VII.** Prepared by LYMAN C. DRAPER, Secretary to the Society. Published by E. B. Bolens, Madison, Wisconsin.

This book is of octavo size, 495 pages, neatly bound in dark cloth, and will be appreciated by the general public as well as the State Historical Society. It is clearly printed on a fair quality of paper and in long primer type. In the introductory, the author says: "This volume will, in many respects, be regarded, if not superior, at all events not inferior, to any of its predecessors. Mr. Tasse's exhaustive memoir of Charles de Langlade, Wisconsin's pioneer settler, made up largely from original sources, will deservedly attract attention." Its index of papers and subjects shows among other matters of interest to the student of history: "Pre-Historic Wisconsin," by Professor J. D. Butler, LL.D.; "Discovery of the Mississippi," by John G. Shea, LL.D.; "Fifty-four Years' Recollections of Wisconsin," by General A. G. Ellis; "Fur Trade and Factory System at Green

Bay, 1816-21;" "Sketch of Shau-be-na, a Pottawatomi Chief," by N. Watson.

Any of these subjects will pay perusal. On page 41, read from the sketch of Mr. Watson as follows: "The parlor was now full of Indians, who stood with their tomahawks and scalping knives awaiting the signal from the chief, when they would commence the work of death. Black Partridge said to Mrs. Kinzie: 'We have done every thing in our power to save you, but all is lost; you and your friends, together with all the prisoners of the camp, will be slain.' At that moment a canoe was heard approaching the shore, when Black Partridge ran down to the river, trying the darkness to make out the new-comers, and at the same time shouted: 'Who are you, friend or foe?' In the bow of the approaching canoe stood a tall, manly personage, with a rifle in his hand; and as the canoe came to shore, he jumped off on the beach, exclaiming in a loud clear voice the musical notes of which ran forth on the still night air: 'I am the Sau-ga-nash!' 'Then,' said Black Partridge, 'hasten to the house, for our friends are in danger, and I alone can save them.'" The general style of the compilation and the other contributions is animated, though of course not of such a sensational character. While we welcome this publication, we think the value of the matter called for both a heavier and better quality of paper than that on which it is printed. The illustrations, by the Heliotype process, are very fair, but not what they should be. In the next volume we shall hope for an improvement in this regard.

**The Washington-Crawford Letters: Being the Correspondence between George Washington and William Crawford, from 1767 to 1781, concerning Western Lands.** By C. W. BUTTERFIELD. Cincinnati: Robert Clarke & Co. Publishers.

A very attractive and neat little book of something over one hundred pages, octavo size, on paper of cream tint, nicely toned, embodies this correspondence between Washington and Crawford. The author in his preface says: "The correspondence, largely a private one, kept up for nearly fourteen years, between the parties, is now given to the public with the belief, that in its revelation of the beginning of Western land speculation, and the part taken therein by the writers, a contribution of value is made to American history. Much interest is added to these letters because of their bringing to light incidents of importance before but little known, in the early settlement of the trans-Appalachian region and in Lord Dunmore's War."

There is certainly a melancholy interest connected with the terrible death of Crawford—and this is heightened by the fact that Washington himself, as well as the American army, was greatly affected by it. Mr. Butterfield very truthfully says: "So long as the history of our country shall be read, the liveliest sympathy will continue to be excited at the recital of Crawford's dreadful suffering, in what was then the far off wilds of Sandusky."

This neat volume is bound in green cloth, and the cover shows the title in gilt letters. The book does no discredit to the publishers.

## SCIENCE AND MECHANICS.

**And Vital Power.**—The students of chemistry have long since discovered that their best mode is by experiment. Not only do they observe that nature unfolds, but they try to place them in circumstances, to find out all their proper laws, to reduce them to a code of simple laws. At the same time, in the physical sciences, there are those which apply to inorganic, organic, and vegetable, and in this new science, besides ponderable matter, there are found phenomena, which are progressively developed, and which constitute a certain evolution, and which constitute, in a word, the life of the universe. Science must bow before the cause of these phenomena, but if it has not the power to explain them, it is not the right and the duty of searching into the laws which rule over their various functions, so restricted and yet so wide, it seeks to discover their principles.

and surgeons have studied every organ with and find that vital force is far from offering the tracter which occurs in the reactions of chem- cannot repeat the same experiment twice on an ut finding some disagreement in the result; the fact, that the organs consist of com- variable apparatus, in which the conditions of not be modified at will, or be changed without functions themselves.

It is agreed that the elements which compose organic matter, and which enter into the immense variety of organic matters which plants produce, owe their origin to ammonia, to nitrates, and to carbonic acid. The green plant body seems to play the most important part in the transformation of these elements, and is composed by the green matter of leaves under the influence of solar light, and disengaging itself from the organic matter, and being brought back to the state of oxide of carbon. It is the product of the transformation, and it afterwards enters into the original of all the combinations which it is capable of forming. It is the point of departure for chemists in the study of the number of syntheses, or reconstructions; so that the transformation of carbon to formic acid, to carbohydrates of alcohols, to composite ethers, to vegetable and animal matters, is but a continuation of metamorphoses governed by general laws.

In dealing in generalities, we go into the detail facts, a multitude of examples are found which intervention of chemistry throws light on the animal life. To mention one: it has been discovered that uric acid may be divided into benzoic acid and glycine; and reciprocally, by combining these two acids, uric acid may be reproduced. This being so, the uric acid of carnivorous animals when analyzed is not found to be benzoic acid; neither do their secretions contain benzoic acid, but the latter appears as soon as the former is in their food. Inversely, herbivorous animals secrete uric acid, because their food contains benzoic acid, and it is not until the latter is removed from the food that the uric acid disappears.

It is found that the extract of malt possesses, like acids, the power of changing starch into dextrine and glucose; and the great French chemist, M. Payen, proved that the extract owed this property to a particular substance called diastase, which exists round the buds of all grain at the moment of germination. Now all seeds possess a provision of starch which serves for the earliest nourishment of the infant plant. As soon as they begin to grow, this diastase is formed; it renders the starch soluble by transforming it into dextrine and sugar, and these dissolved matters are afterwards used in nature's laboratory to constitute the first vegetable organs. Thus chemistry has reached the point of giving an exact account of the transformations to which a plant owes its earliest development, and they are absolutely the same as those carried on by the chemist.

It is to similar action, exercised by the gastric juice and all the liquids of animal economy, that our food is dissolved in the process of digestion, and may be absorbed in the system. The celebrated experiments of Rumford and Spallanzani in the last century to produce artificial digestion, prove it without doubt. It is to this also that we must attribute the production of sugar in the liver of the animal.

It is known that organic tissues are constituted by fibres and elementary cells, separated from each other by very small interstices, which contain a certain quantity of water, without which these tissues would be deprived of the physical and mechanical properties essential to their functions. It must never be overlooked, that even in the most rudimentary animals, life can only exist in the presence of water and under the influence of a certain temperature. This has been shown by the experiments made on the little rotifera, whose movements cease and re-commence whenever it is dried and moistened. The same is true of vegetables, and the explanation of how the sap rises and circulates in them has been realized with the help of mechanical action.

The most attentive student has failed to discover in the vegetable tissue any muscular apparatus which could set the liquids in motion, therefore it follows that the circulation of sap must be regulated by the play of physical and chemical forces. Hence it is necessary to fall back upon the attraction which solid bodies exercise on liquids, and which is called molecular attraction, because it seems to exert itself at distances as small as those which separate the molecules themselves. It remains to be seen in what measure this action can influence the rising of the sap.

When a very fine tube is plunged into water, a certain quantity rises in it, because the solid walls attract it, and as vegetable tissue offers similar narrow channels in every direction, it can be understood that it raises and absorbs the water from the soil; but this general explanation is not sufficient, because the ascent of the water is limited to a very little height in a narrow tube, and in trees the sap rises to the summit. This objection has given rise to many experiments among chemists.

Take any porous mass, a block of chalk, for example, and after hollowing a small hole in the centre, place it in a

manometer, that is to say, an instrument to measure the pressure of air which will develop itself in the interior of the block. When that is done, plunge the whole into water. In a moment the liquid enters the pores, as is seen in a lump of sugar, and drives the air which fills the cavities before it. This air flies to the centre, where it is gradually compressed, and the manometer rises rapidly under the pressure. When the final state is reached, it is evident that the air tries to escape as the water enters, and that the pressure of the air makes an equilibrium by the force of penetration, and gives the measure, which is equal to three, four, or even six of atmospheric pressure. Thus the atmosphere being equal to the pressure of a column of air ten feet high, the strength of the imbibing power may be said to equal thirty, forty, or sixty feet of water, and consequently the liquid can rise to these heights. The force of imbibition suffices to explain how the sap rises to the summit of the highest trees.

But another experiment is necessary to thoroughly understand how liquids circulate. Take a tube of glass, and glue to one end a porous plate, so as to close the opening; fill the tube with water, and cover the open end with the finger, so that the water does not escape until it has been turned over into a bath of quicksilver. The porous plate then imbibes the water, which evaporates into the air at the upper end, and is immediately replaced by that in the tube; a void is thus formed in the interior, into which the mercury rises, as in a barometer, and the air does not enter through the porous plate.

These two experiments are sufficient to show the exact mode in which the sap rises. According to the first, the roots take up the water from the soil, and make it rise to the leaves; the second shows how the evaporation of this water in the atmosphere makes a void in the tree, which will call up, by the effect of suction, that which fills the channels of the stem. M. Jamin, a French chemist, has constructed a model which will apply to all vegetables to justify this explanation. The base is formed of a very dense porous body, which represents the roots, and which is planted in damp earth; from this rises a tube, filled with plaster for the stem, and at the top is a large porous surface, taking the place of leaves, and serving for evaporation. Experience has proved that this fictitious tree absorbs the water like real vegetables, and spreads it through the air in the same way.

When a very fine tube of glass is plunged into water it rises high within the narrow space; if into oil, the latter mounts to a less degree; or if the glass tube be changed for another of the same dimension, but of a different substance, the effect is varied in intensity, whilst preserving the general character. Molecular force depends, then, on the nature of the bodies where it exists; it has some analogy with that productive power of chemical combinations which is named affinity, and which has for its special character that of depending entirely on the nature of the two substances which combine. Every time that this affinity takes place, heat is developed; the temperature has always been observed to rise in a porous mass at the time of imbibition; and a German physicist has discovered that a strong electric current is produced when water is filtered by pressure through a porous body. The consequences which result from this affinity may be traced in many different bodies.

**Evolution.**—The scientific minds of the day, and a very large number of minds unscientific, both by nature and education, are discussing, in some form or other, the evolution theories, while here and there a few positive characters are experimenting, and delving down deep into the mysteries of science. It has been said that "there is nothing new under the sun," yet only those whose minds are like the stagnant lake, void of life or motion, accept the statement as an embodiment of the whole truth. Especially is the American mind loth to receive it as a wholesome doctrine. The dead and by-gone nations and individuals might have stated the commencement of their decay and downfall at the period when such as this idea was palatable food for thought. The American people believe there are many things new under and over the sun; and that this belief is one of the leading causes of many of the so-called "wonders of evolution." If evolution be the act of unfolding or unrolling; the process of growth and development; as the evolution of a flower from a bud, or an animal from an egg; a model of generation in which the germ is held to preëxist in the parent stem or root, then it must be too plainly evident to admit of dispute, that every new unfolding, fresh growth, step on to higher planes, each opening flower, or new life in any of its myriad forms, is not only a new, but a living proof of evolution. The great reform agitation itself stands on the firm rocks of evolution. Progression, whether it be mental, moral, social, or physical, recognizes and must ever continue to recognize the truths of evolution. Nature herself proclaims that only through the evolutions of her forces could she live. The flux and reflux of the sea impart life to the mighty waters and the wonders therein; the whistling winds, floating clouds, and lightning flashes, breathe life to the moving world on the land and in the air; the less boisterous forces beneath the earth's crust, in the mines, and under the mountains, tell of continual change: decay, death, and resurrection to a new life and order. Even the mechanical and artificial powers, when overutilized, lose their beauty, force, and efficiency. The silent mill-wheel soon becomes useless; the unwound watch early rusts; the street void of life is early moss-covered; the unused rapidly chokes with rubbish and filth. So it is with things. The revolution of the planets, the change of seasons, scenes, and occupations, are the life-creators and life-preservatives of the countless millions of animated creatures on the land, in the air and the sea. Old things pass away, and all things become new. Progression is evolution, and obeys the immutable laws, supreme and universal.

In this connection we give our readers a brief of an interesting paper by Dr. J. S. Newberry on this subject, read at the regular meeting of the New York Academy of Sciences, held recently. The paper will be found of special interest to Americans, as it treats of the Evolution of the North American Continent. Dr. Newberry said, that the oldest rocks we know are themselves formed from sediment deposited by the disintegration of still older rocks of which we have no trace, and which may have likewise been the sediment from a still earlier continent. Of this older continent, we know not where it was nor what it was; we only know that it was large enough to form a continent from its own ruins. Its history has been obliterated. Beginning with the old metamorphic rocks, known as the Laurentian and Huronian, which extend from

brador to the Lakes of the Woods and as far north as the Arctic Ocean, we have the oldest known form of the American continent. Since that time it has been a changing form by the formation of newer rocks. Owing to the cooling and contraction of the earth, there is a continual tendency to raise the high lands higher and depress the valleys lower; while at the same time other influences are at work, grinding off the elevations and filling up the depressions. In many places the dig or bore down to the old metamorphic shales and slates, surrounded by newer rocks. There are islands of these old slates in Texas, and the Black Hills were found by James Jenney and Newton to be an island of these old rocks very much disturbed, with the slates turned up on edge. They contain characteristic shells which connect them with the Potsdam of New York. The Pacific coast is a rock-bound shore that seems totally invulnerable; but the big rollers come in and pound away at the rocks perpetually, until the rocks are undermined and fall. Finally the rocks are pulverized and carried off to be deposited in the far distant sea. This sea has taken possession at different times of different parts of the continent. Wherever there was a depression, there has been a deposit of the remains of sea fish, bones, teeth, etc., on the bed of the sea. When the sea be-

came shallow, another series of deposits, shells, etc., was made. Thus each period left a record of the physical conditions and the kind of life that existed in the sea at that time.

At the same meeting some choice minerals at the Centennial were illustrated by a large number of beautifully executed water-color drawings. Among the minerals referred to were the native copper and silver of Lake Superior. Drawings were shown of calcite crystals of a delicate wine color, also of stalactites and stalagmites from the lead mines of Iowa. Arizona sent a meteor weighing 1,400 lbs., and Mexico another. Among the beautiful things there were emeralds, rubies, and crystals of corundum from North Carolina. Mr. Chamberlin also spoke of the amazon stone from Pike's Peak, California, and exhibited beautiful drawings of this green mineral, some specimens of which have sold for one hundred and fifty dollars. He described the diamond exhibit from South Africa as exceedingly interesting, embracing both white and colored stones. In the collection sent by the School of Mines, St. Petersburg, was a topaz five inches in diameter, also emerald in rock, crocoite, and other beautiful and rare minerals. In other portions of the Russian exhibit, the magnificent display of polished stones and gems, lapis lazuli, malachite, labradorite, rhodonite, etc., made a splendid display.

## OBITUARY.

**Fletcher Harper.**—We are again called to chronicle the loss of another life. Death, the steady reaper, has claimed the more of New York's honorable and aged citizens. Mr. Fletcher Harper, the youngest and last surviving member of the original firm of Harper Brothers, since the last issue of the MONTHLY has passed into the silent "City of the Dead," at the age of seventy-two, after some seven weeks' illness.

As one of our own brotherhood—publishers—with sadness we record the termination of a most useful life. The deceased was born in Newtown, Long Island on the 31st of January, 1806. At home was the major portion of his school-days spent, from which he attended at various times the common schools.

When but a boy he went to New York and entered the establishment of his brothers, J. & J. Harper, then on Fulton street, near Broadway. At this place he served his apprenticeship, and was admitted to partnership with his brothers in 1825, when not yet twenty years of age. In the same year he was married, and about the same time the business of the firm was moved to Cliff street. Later on, in 1833, the firm took the name of Harper Brothers—the partners being James, John, Joseph and Fletcher—and so completely have they been identified with each other and the business, that the history of one member of the firm is to a great extent a history of the other brothers.

Fletcher Harper, whose death leaves the firm without one of its original members, was a man of thorough, systematic business habits, always being on duty at nine in the morning and remaining until the close of business hours. The branch of the business in which he took a more special interest was that of the periodicals, and to his faith in their success is due

in a great measure the excellence and renown which they have reached. They have always been under his supervision.

Soon after the death of his brother John, in April, 1875, Fletcher Harper retired from active participation in the affairs of the firm, although he did not, as has been stated, withdraw, but remained the junior partner until his death. He had been in poor health for several months, but was not until quite recently considered dangerously sick.

From early life Mr. Harper was connected with the Methodist church, and at the time of his death was a member of St. Paul's M. E. church, corner of Fourth avenue and Twenty-second street. He leaves a wife and two sons, Fletcher, Jr., and Joseph, both of whom are connected with the business, the former being a member of the firm. All the surviving partners are sons of the original members, and the firm name will not be altered.

**Mrs. Elizabeth Fries Ellet.**—This lady, better known in the world of letters by her maiden name, Elizabeth Fries Lummis, ceased her life's battles on Sunday, June 3d, in New York city, at 170 Twelfth street, the result of an apoplectic attack on the preceding Tuesday.

While it would not be possible in this brief to do justice to the memory of one so well known to the reading public, we cannot refrain from recording a slight tribute in honor of a noble life consecrated to worthy objects in a noble profession.

Mrs. Ellet was the daughter of William A. Lummis, M.D., and widow of William H. Ellet, M.D., late Professor of Chemistry in Columbia College, New York city, and in the College at Columbia, South Carolina. She was born at Sodus, New York; and the world has been made wiser and

better through that birth and the subsequent career of that patient, painstaking, and loyal spirit after development into the full bloom of womanhood. To the literary circles Mrs. Ellet was known as a most prolific and fascinating writer, her works largely partaking of the character of reminiscences and history, wreathed now and then with poetical musings. Her first publication, a poem, in the *American Ladies' Magazine*, Boston, appeared in 1833, and a translation of Silvio Pellico's *Euphemia of Messina*, in 1834. This was followed by *Poems Original and Selected*, in 1835; *Teresa and Constanza*; a Tragedy acted, 1835; *Scenes in the Life of Joanna of Sicily*, 1850; *The Characters of Schiller*, 1841; *Rambles about the Country*; *Evenings at Woodlawn*; *The Women of the American Revolution*, 1848; *Family Pictures from the Bible*, 1849; *The Domestic History of the American Revolution*, 1850; *Watching Spirits*, 1851; *Scripture Gift-Book*; *Pioneer Women of the West*; *Nouvelles of the Musicians*; *Summer Rambles in the West*, etc. She was well known as a welcome contributor to the standard periodicals of the day, among which were the *North American* and the *American Quarterly*. For critical notices of her writings, see Griswold's *Female Poets of America*, Mrs. Hale's *Women's Record*, and the *Southern Literary Messenger*. An English periodical of considerable authority, the *London Athenaeum*

says: "In treating the 'Women of the Revolution,' Mrs. Ellet is fair and honest; and the illustrations which might be drawn from a book like this, contain a lesson neither ephemeral in value nor limited in its application."

In closing this sketch of one of the most popular writers of America, we cannot omit speaking of the unselfishness which was a strong trait in the character of our departed friend. She ever felt for and sympathized with frail and suffering humanity, and her open heart and ready hand made many a home happier. As a contributor to this magazine, her article, "Life with a Kiss; a Historical Incident," published in the May number, called forth some evidences of the goodness of her heart. In reference to the manuscript, she wrote to the publishers, "if the editor would be likely to accept it, Mrs. Ellet will write it out and send it. What little it may bring she will give to a charity—a poor young mother and her three children under six." Thus her hand was ever stretched out to succor the needy and distressed; and many hearts besides ours will be shadowed by the withdrawal of one of earth's richest jewels and brightest stars from the literary world. We feel sure that such a life as Mrs. Ellet's goes not out, as all that is mortal passes down the valley, but that the potent influences which she put in motion will survive till the end of time.

## GOSSIP AND NOTE BOOK.

**An Open Page of the Beautiful.**—A few days ago we were guided by the iron horse on the North Penn Railroad, while seated in the comfortable coaches assigned for passengers, from Philadelphia to Bethlehem, and the Blue Mountains, and after having gracefully and rapidly threaded our way through country and village scenery of the most charming character, all speaking of intelligence, taste, culture, industry and the refinement of an ever advancing civilization, the rosy morning, bracing and beautiful, found us seated in a really romantic section of the mountains, at an altitude at once commanding a bird's-eye view of mountain, hill, valley, river, rivulet, meadow and forest, always captivating to the traveller from the densely populated city, with its miles of brick, stone and mortar; but unusually inviting in this leafy month of June. At our feet, half shut out from view, nestled one of those lakes so far famed for trouting, in which were reflected in its clear and placid waters the majestic trees on its borders, some of which seemed to bend so low and near as if they fain would kiss their own dear selves; by our side, feasting on this open page of nature, sat our companion, a gentleman familiar with foreign lands, and especially with the picturesque scenery of England and Scotland. "This is as beautiful as Windermere," he said, "and yet few tourists visit the borders of this lake. The English make the most of their scenery. That cataract of Lodore, near Keswick, for instance, concerning which Southey wrote, is no larger than one of our mill streams, and in dry weather there is no cataract at all. One cannot have a Niagara every day, and I think the English are wise in appreciating to the utmost the romantic scenery of their little island."

Is there not in this a lesson for us all? Few of us have a bit of woods, a green field, a patch of blue sky, a running stream of water or a still lake that we may not magnify and dwell upon until communion with these various forms of nature gives calmness, repose and peace to our lives. Oleanders and cape jessamines are gorgeous and beautiful and fragrant, but so are wild roses and apple blossoms and blue violets. One sweet blooming rose in the window may fill the house and the heart with suggestions of Eden, if that heart be in tune; all tropical luxuriance is thrown away on him who has no eye to see, no heart to feel its beauty. We grasp after so much—wealth, learning, fame, travel—thinking by-and-by, when the point is reached that elevation is attained, the life-long aspiration is realized, we shall be happy; but genuine happiness comes only to those who sift from the passing days every element of enjoyment, and are chronically and resolutely thankful for what they have. "Let a man count himself worthy of having," says Carlyle, "and everything except the rope will be received with gratitude." With this we by no means agree, and certainly think Carlyle in his better moments would never have uttered it; yet as an illustration of the effect of deprivation, it doubtless had its end. We cannot accept the theory that as a means to elevate, we must first debase, or make low. A greater truth was enunciated by Mr. Beecher, when he said, "to continually hold up before any people their faults and supreme unworthiness, and rarely their good and noble manifestations is, to educate them for the penitentiary and the almshouse." There however is a truth in Carlyle's statement as applied to some individuals. They count themselves as entitled to so much prosperity or good

too often they overlook the diamonds and sparkle in the dust at their feet. On this it is ponder.

morning the sun rises in glory and sets at even-  
lor. Do we enjoy it? In this season, the first  
tiner, when all nature seems to expand into  
ben the pink, red, and white blossoms are smil-  
everywhere; when the balmy air makes even  
garden petals sing sweetly to the toiler or the  
rell to pause and ponder; to ask, what all this  
ere on this mountain top, near this lake silently  
hear whisperings in voices more musical than  
e signs and symbols are nature's own—Do we  
apprehend the sermon hourly delivered to us in  
temple? These discourses, though silent, they  
from a thousand rostrums, and in mysterious  
r-living truths which emanate from nature's  
osty trees and infant plant, the babbling brook  
ataract, the blushing rose and modest daisy, as  
ring artillery and lightning of the shifting clouds,  
power, wisdom and goodness of Him who  
and peopled the known and the unknown  
prids. While nature rejoices in the life-giving  
sun or reposes at night beneath the glowing  
any of us open our hearts and minds to these  
id allow these grand teachers to give us their  
g lessons? The responses from most of us only  
glect or silent indifference. It was not so with  
sworth listened, looked and learned, and the  
h him was made better. The open page was  
him to be read and studied. Likewise Hum-  
r and others have enriched mankind by the  
red from the pages of nature. From them let  
ove for the beautiful, and reflect its light on  
ay.

dwelt upon may darken all our lives; even so,  
ay be made to expand, and increase till it shall  
he soul and throw its halo on an ever increas-  
if the children of men.

**Spoil the Pupil.**—The lectures of the Greek  
were attended by a young girl of exquisite  
day, a grain of sand happened to get into her  
ig unable to extract it herself, she requested his  
As he was observed to perform this little opera-  
teal which, perhaps, a little less sparkling eye  
ave commanded, somebody called to him in  
not spoil the pupil."

**ish Language.**—Bayard Taylor, in one of his  
ays that he has noticed one striking change in  
is the astonishing spread of the English lan-  
the last twenty years; resulting both from the  
English and American travellers who visit the  
e use of the language by travellers of other  
French, which until within the last few years  
able, has been slowly fading into the back-  
is already less available than English for Italy  
rient. I was a little surprised in Rome at being  
native boot-black with, "Shine up your boots?"

In Naples, every pedler of canes, coral, photographs, and  
shell-fish knows at least enough to make a good bargain; but  
this is nothing to what one meets in Egypt. The bright-  
witted boys learn the language with amazing rapidity, and  
are so apt at guessing what they do not literally understand  
that the traveller no longer requires an interpreter. At the  
base of Pompey's pillar, to-day, a ragged and dirty little  
girl came out of a fellah hut and followed us, crying, "Give  
us a ha' penny!" All the coachmen and the shopkeepers  
are familiar with the words necessary for their business, and  
prefer to use them, even after they see that you are acquainted  
with Italian or Arabic. The simple, natural structure of the  
English language, undoubtedly contributes also to its exten-  
sion. It is already the leading language of the world, spoken  
by ninety million people (double the number of the French-  
speaking races), and so extending its conquests year by year  
that its practical value is in advance of that of any other  
tongue.

**A Beautiful Sentiment.**—Dr. Chalmers beautifully says:  
"The little that I have seen of the world and know of  
the history of mankind teaches me to look upon their errors  
in sorrow, not in anger. When I take the history of one  
poor heart that has sinned and suffered, and represent to  
myself the struggles and temptations it passed through—the  
brief pulsations of joy, the tears of regret, the feebleness of  
purpose, the scorn of the world—that has little charity—the  
desolation of the soul's sanctuary, and threatening voices  
within, health gone, happiness gone—I would fain leave the  
erring soul of my fellow-man with Him from whose hands it  
came."

**Sound Sleep.**—Sound sleep is essential to good health.  
It is impossible to restore and recuperate the system ex-  
hausted by labor and activity without this perfect repose.  
Sleep has a great deal to do with the disposition and temper.  
A sound sleeper is seldom disturbed by trifles, while a  
wakeful, restless person is apt to be irritable. A great deal  
has been written about the advantages of curtailing the hours  
of repose, and of sleeping but little. We are inclined to  
think that there is room for doubt whether the benefits of  
closely limiting the time given to rest have not been  
exaggerated. Active persons of nervous temperaments can  
hardly get too much sleep. We know very well that the  
saving of two or three hours a day from slumber is in one  
sense equivalent to a considerable prolongation of human life,  
and we are no advocate of indolence; but the fact still  
remains that sleep may be so much abridged as to leave the  
system incapable of as much effective work in two hours as  
might be performed in a better condition in one.

**"Ise nowhar near de Top."**—It is generally supposed  
that the "average American" beats the world in his love of  
big titles, and in his use of them; but the freed Southern  
negro beats his white fellow-citizen all hollow. We hear  
from Texas of one who is Head Centre of a Lodge—exactly  
of what sort we don't know, but we suppose that it must be  
a lodge in the wilderness or perhaps, in Solomon's phrase, a  
lodge in a garden of cucumbers. This "cullud pusson" will  
spend two months' wages to "report" at a grand junction

"jamboree" of his "lodge." The titles of the officers of these associations are something wonderful. A negro office boy down there asked leave of absence for a day to attend a meeting. "Why," said his master, "Scip, I didn't know you belonged to a lodge." "Oh, yes, boss," replied Africanus, "Ise Supreme Grand King, an' Ise nowhar near de top nuther." Who shall say that the abolition of slavery was not worth all that it cost?

**Griswold and Poe.**—The *Tribune* repeats the story published by Mrs. Stebbins of an attachment of Dr. Griswold and Poe for the same lady, and that the literary and personal animosity of the poet and the critic grew out of their rivalry in love. The *Tribune* says: "There are enough persons who knew all the parties concerned, still living in this city, to confirm the statement of Mrs. Stebbins." That Poe and Griswold were both friends and admirers of a certain beautiful poetess, whom they had both done a good deal toward rendering famous, there is no denying, and as she and her husband are both dead, there might be no impropriety in naming her, only that she has children living, who would naturally be unpleasantly affected by seeing their mother's name published in connection with such a literary scandal. But the personal and literary encounter between Griswold and Poe commenced in Philadelphia, when they both lived in that city and when one edited the magazine to which the other was a contributor. Poe did not then know the lady in question; but Griswold did. Poe's acquaintance with her commenced after his coming to New York to live, and, as he was married, and the lady was married, and Griswold was married, the attachment must have been of a purely literary nature, as Poe's attachments mostly were. Dr. Griswold was a very much marrying man, he having had three wives and many other attachments. He and Poe used to say sharp things of one another; but they were really good friends, and Griswold, with his personal knowledge of Poe and all of the dead poet's letters and private papers in his hands, treated him more generously than any other biographer would probably have done. Those who speak ill of Griswold for the evil he said of Poe would doubtless think differently of his motives if they knew what he suppressed.

**Destiny.**—Zeno, the philosopher, believed in an inevitable destiny. His servant availed himself of this doctrine one day while being beaten for a theft by exclaiming, "Was I not destined to rob?" "Yes," replied Zeno, "and also to be corrected."

**Working Hours of Authors.**—The literary habits of a number of London dramatists and novelists are thus set forth in the letter of an English correspondent:

Mr. Trollope asserts that he does all his writing before breakfast. Mr. Tom Taylor said, at a literary fund dinner, that all his literary work had been done before official hours in the morning. H. J. Byron says he only writes two hours a day, but he takes credit for thinking a good deal. Mr. Hepworth Dixon literally writes from morning to night. "George Eliot" is at her desk six or seven hours a day. Mrs. Henry Wood writes every day until dinner time. "How many hours a day do you write?" I asked Farjeon to-day.

"All the time," was the reply, and it was very near. The late Lord Lytton said that in two hours daily great in literature might be done.

Why even Walter Scott never, on his working days, less than four or five hours, and he always sat down to desk primed. There was no affectation of leisure about authors of "Pendennis" and "David Copperfield," and Macmillan would lock himself up for weeks together, and write after hour at a stretch, and would come forth into the world with his book, haggard, careworn and exhausted. Braddon has been in the habit of writing from ten to twelve hours every day, and only a couple of years ago her work was so incessant that it turned her brain, and she had to lay down her pen for many months in the middle of a novel which was finished by a friend.

**A laughable story** is related of Dunning, an English judge. It is said of him that frequently, in the examination of witnesses, he often displayed great coarseness, and upon himself the animadversion of his brethren. On one occasion, wishing to establish the identity of the party at the instrumentality of an unsophisticated old woman (sitting the witness stand), the following highly amusing conversation is said to have taken place between Dunning and the woman.

Dunning.—"Was he a tall man?"

Witness.—"Not very tall, your honor—much about the size of your worship's honor."

Dunning.—"Was he good looking?"

Witness.—"Quite contrary—much like your honor, with a handsomer nose."

Dunning.—"Did he squint?"

Witness.—"A little, your worship; but not so much as your honor by a great deal!"

These replies produced a roar of laughter in the court, which Lord Mansfield (who was on the Bench) is said to have joined.

**Leisure Hours of Great Men.**—Some of the best wits have exercised a leisure hour in constructing epigrams full of ingenuity, fertile in idea, and graceful in language.

The following example is attributed to Charles James Fox, and is without much difficulty seen to relate to glass:

What is pretty and useful in various ways,

Though it tempts some poor mortals to shorten their days,

Take one letter from it, and there will appear

What youngsters admire ev'ry day in the year;

Take two letters from it, and then, without doubt,

You are what that is, if you don't find it out.

One of the best enigmas of this class was by Lord Mansfield, on the word—but we will leave the discovery of it to the reader:

Cut off my head, and singular I am;

Cut off my tail, and plural I appear;

Cut off my head and tail, and, wondrous fear,

Although my middle's left, there's nothing there.

What is my head cut off? a sounding sea;

What is my tail cut off? a rushing river;

And in their mighty depth I fearless play,

Parent of sweetest sounds, yet mute forever.

# POTTER'S AMERICAN MONTHLY.

VOL. IX.

AUGUST, 1877.

No. 68.

## CIVIC AND SCENIC NEW ENGLAND.

By ORAMEL S. SENTER.

### II.—THE CAPE REGION AND MARTHA'S VINEYARD.

WEBSTER'S HOME AT MARSHFIELD.

IN the last number of the MONTHLY we gave the reader some account of that historic town and superb watering-place, Newport. Yet, notwithstanding all its attractions, so choice and varied and pleasing to some, it does not suit the average American, except it may be to gaze at and admire for a brief space, and then leave it for more congenial places. It is too select for his tastes—sometimes too expensive for his purse—and its *exclusiveness*, as he terms it, does not accord with his notions of liberty, and his broad sense of democratic equality. So until Newport becomes more cosmopolitan in its customs and less expensive, as it will doubtless in time, we must look elsewhere for watering-places for the masses, the millions, so to speak.

Of these there is no lack indeed in our vast and noble country, with its mighty rivers and water-

falls, its grand mountains, glens, cañons, caves, and bridges of rock, its hot springs and healing waters, and its boundless ocean shore affording tonic baths and exciting, healthful sports.

In determining our next field of inquiry, we find it not a little difficult to decide between the mountains and the seaside, each having its attractions and strong points. We should like to choose the one which will best please the reader, and we accordingly appeal to him as the umpire.

Say, dear reader, shall it be  
To the mountains or the sea?  
I am balanced; choose for me.  
Comes this answer in a troth,  
"Joy's in each and health in both  
Who goes to either, wisely doth."

So we are left hanging upon both horns of the

dilemma as before, till a friend comes to the rescue and says: "Our people are flocking to the sea-side in increasing numbers each year. This being so, you will do well to visit the Old Bay State, and tell your readers about some of the many charming resorts of Cape Cod and Vicinity, which are becoming more and more popular as their merits are more widely known. Here one can enjoy the purest sea breezes, the best of bathing facilities, and any amount of healthful recreation, at the very *minimum* of expense, an important consideration in these times that have well-nigh reached a state of financial *asphyxia*."

This settles the question for us and for all; and we conclude to go where—

Health is wafted on the breeze,  
Or is found within the seas—  
Sports on land and on the wave,  
For the timid or the brave.

Our field being Massachusetts, we must first slip down to the "Hub" to take our bearings, and see that we start right, going by that important spoke in the wheel, "the Old Colony Railroad."

But what means this word "Hub," a term that is much used, as a boast by some and as a standing joke or slur by others?

They know not what  
A word they've got:  
THE WORLD CONDENSED  
By th' "Hub" is fenced.  
Aye, there's the rub  
About the hub,  
A term oft used,  
And much abused.

If you would learn its full meaning and get at the true sense, essence, and unction, inquire of a Bostonian, and observe with what grace and complacency he will explain all and make it as plain as the spire on Shawmut Hill, and clear as the light of day. Hear him: "Is not Boston the capital of Massachusetts and the metropolis of New England? Is it not the cleanest, best governed, and richest city in the country, and did not Mr. Webster delight to call its business men 'the solid men of Boston?' Is not this city the focus and leader of our great system of public education, and, with its suburb, Cambridge, the centre of authorship and literary genius and taste? Does not her commerce whiten every sea, and her manufactures enter into rivalry with the whole world? And did not the principles of liberty and self-government, that are now enthroned at the capital

and dominant over the land, originate and receive their effective power in Boston and Bay State—the very cradle of liberty and rights?"

Hold, my friend. If you will but stop, you will concede that Boston is the "hub" of the universe, if you please—and that you have treated the subject as lucid as a moonbeam—pray hereafter you will not remind us of this often, but just leave your city with its laurels modestly to speak for themselves.

Be satisfied henceforth to say of the illustrious statesman once said of the State she is—behold her and judge for yourself.

On reaching Boston, and consulting maps and guides at our command, we are satisfied that the "Cape Cod Region" embraces seaside resorts that we could visit in little time, and more than we could describe within the limits of a single article, and that the "Old Colony Railroad," with its numerous branches, is able us to reach them all in the most comfortable and expeditious manner.

But first we should let the reader know what we mean by the "Cape Cod Region." The origin of the term, "Cape Cod," is often used to designate the peninsula, or narrow neck of land to the east and south of "Cohasset Narrows," at which point the sea came near making an indentation of all that part of Massachusetts. It is, however, to include the coast for a long distance each way from the "Narrows." We will use the expression "Cape Cod Region" in a large sense; or as including all that section of the southeastern limits of Rhode Island, and the winding sweep of land and ocean between that point and Boston. It is embraced substantially by a line running from Narraganset Bay, at Fall River, to Boston Harbor, and is described or limited in this direction by the main line of the Old Colony Railroad. In going from Philadelphia to New York, if you wish to strike the lower Cape Cod, or that part lying beyond Cohasset Narrows, it is not necessary to take Boston in the route. You can go by way of Somerset Junction at Taunton, making the distance much less. The Cape Cod proper is about the queerest shaped piece of land to be found on the globe. Its general shape is that of a man's leg, including the foot, and the heel has a pretty long heel, and turns outwards at the toes—worse than the modern fashion

This grotesque figure of a boot looks as though it were clothed in a snow-shoe, a pair of skates, or an Indian moccasin. Which it most nearly resembles and best represents, the reader can decide for himself. One thing is certain, that this unique piece of land, which seems to have been thrown

something interesting to the careful observer and lover of nature.

Some portions of this region are fertile, or have been made productive and fair to look upon by superior cultivation. But, as a whole, you look at this part of Massachusetts and wonder how it ever

CAPE COD PENINSULA AND ITS CONNECTIONS.

out as a freak of nature in one of her most capricious moods, is more like itself than anything else. The narrow part of this peculiar figure, which might be called "the foot of time," whose direction is first east, and then north, and then southwest, as will be seen by turning to the map, is not a belt of land, almost or quite level with the water, holding this part of the world together by a rope of sand, ready to be broken by the waves at any moment, as we had supposed, but much of it is a high range of irregular hills, some of it beautiful, some of it picturesque, some of it neither, but all parts offering

became settled, and how the people live who are still there. One of her own poets has answered the question:

"Sterile her soil—not hers the grain  
Waving o'er hill and lea;  
What matter? while her gallant sons  
Are tillers of the sea."

As a comment upon this, we state the fact that the day we reached Provincetown, two of her fishermen caught a thousand bluefish, worth a round hundred dollars. And everywhere in our travels on "The Cape" we saw thrift, intelligence, and

a cheerful content remarkable for the times, and nowhere did we meet a single case of begging or drunkenness. The "Patient Man" must have had his eye on Cape Cod and her blissful state when he said "Give me neither poverty nor riches."

To the inhabitants of Cape Cod, the ocean is their granary, their meat-barrel, and their money-chest. Throughout this projection of rough hills,

PLYMOUTH'S MONUMENT TO LIBERTY.

sterile knolls, and sandbanks, interspersed everywhere with spots of beauty and comparative fertility, there are fine bays, harbors, and coves, setting into the land—sometimes almost through it—which abound in fish of every variety known to our waters, including those standard kinds, cod, mackerel, and bluefish, in great abundance. The Hon. N. E. Atwood, of Provincetown, who is an authority equal to Agassiz, on living fishes, enumerates some ninety species that inhabit the waters surrounding Cape Cod.

The first point we made was Provincetown, the very land's end of the Cape region, although on our way hither we took, by way of episode, a slip of a few hours down to that little gem of a port, Hyannis—of which more anon. We reached Provincetown in the evening, but amid flashes of light and still more numerous streaks of darkness, for the town is badly lighted, we could see that there were people and dwellings here. Judge of our surprise, when the morning light revealed to us, instead of a few fishermen's huts, as we supposed it would, a large place—a solid and noble town, built amid the sand-hills, it is true, but abounding in fine stores, good houses—some of them elegant—and the whole place having an air of comfort and prosperity in marked contrast with many communities surrounded apparently by far greater natural advantages. But the most striking feature of Provincetown is its magnificent bay—one of the deepest, safest, and most spacious in the world. The main harbor or bay is some six or seven miles across it, and ten or more in length, and securely land-locked in the great coil or bend of Cape Cod, which here folds in its grasp a portion of the "stormy deep," making a haven where ships may rest as safely as though hemmed in by a great wall.

We often hear of harbors, where it is said that the navies of the world may ride in safety, which are little belts or basins of water compared with this great bend or fold in the flowing robe of the grand old Atlantic Ocean. The harbor immediately fronting the shipping portion of the town is formed by a spur from the main point of the "Cape," which is little more than a vast sand-bar joined to the main land, setting off a portion of the bay about two miles in width, with a depth of water of sixty feet, constituting a perfect road for ships and smaller craft. The opening around this point of land, which is a vast natural breakwater, is from two to four miles in width.

The population of this town, according to the State census, is about four thousand five hundred, the greater part of whom are engaged in the fisheries. These are divided up between "whaling," the cod and mackerel fishing, upon the Grand Banks, and that of various kinds upon their own coast. They have at this date twenty-one ships engaged in the sperm-whale fishery, outranking all other towns in the State except New Bedford and New London. They have also a number of ships employed in the general coasting trade.

tire shipping capacity exceeds sixteen tons.

etown, though not one of the oldest the State, since at first it was occupied fishermen, is a spot of great historic in-

grim Fathers first landed here, some ten days before they made their final landing uth, and here in this broad and beautiful the "Universal Yankee Nation" had its the person of Peregrine White; and here,

Great Republic, with its institutions, had its inception impact adopted on board the r, a document that embraced of every human right, and me the MAGNA CHARTA of

are four hotels in the place, three of permanent, and one is kept open only e season of pleasure travel. Of the per- otels, we found the "Pilgrim House," Mr. S. S. Smith, to be a good hotel. exclusively for summer boarders, is called proprietor, James Gifford, who is also of the port. This house is most delight- ted just back of the main street, on an nearly a hundred feet above the level of of which it commands fine views, with or about seventy-five boarders. Every- and about the premises is of the most and inviting character, and we are sure house, if it receives its deserts, will be and running over. Mr. Gifford is thor- roved in history, literary lore, and gen- ledge, and is a fine representative of the ligit class of Yankee landlords.

What this place most needs to secure for it a large and fully merited share of summer boarders and pleasure-seeking visitors, is a line of steamers from Boston. The distance directly across Cape Cod Bay is scarcely fifty miles, and a strong swift steamer could make the round trip daily, giving passengers several hours for dinner and recreation, with opportunity to return the same day, or at some future time. Going to Boston in this boat, would involve the necessity of staying in the city over night. This would prevent the regular Prov-

THE PAWNEE HOUSE, OAK BLUFFS.

incetown travel from taking this direction, and so avoid all opposition or fear of rivalry on the part of the railroads. It would bring a multitude of people and patronage to the place, while it would take less business from the railroads than it would bring them. So the citizens of this town claim, and the position seems to be based upon sound reasoning.

There is one peculiarity about Provincetown which deserves to be noticed. The name itself is derived from the fact that its territory was without the limits of either of the Massachusetts colonies, and constituted, including some other towns, we believe, a little province by itself. Not having been chartered or conveyed to any one by the King of Great Britain, the title that was latent in the crown, including the right of eminent domain and the title to the lands, passed over to and merged in the Commonwealth of Massachusetts at

the time of the Revolution. But the State had never patented the land to anybody. The original inhabitants were all squatters, at first fishermen only, then settlers and citizens, with no right to the land but that of occupation and improvement. In this condition the war of the Revolution found them, and thus they have remained to this day, no one having any original title to this land except that of prescription. Yet the State has not only never deeded any of the land, but has assumed no occupancy over it. The real occupants have gone on making improvements and deeded the land from one to another by warrantee, as fully as though they had derived it by original patent from the British King or the United States Government, with an undisputed chain of title. It is probable, that if carried to the courts, the right of the inhabitants would be sanctioned and confirmed as fully as the glebe lands to the Church of England, or lands in Great Britain vest by immemorial use. When we left the city, and on the cars, it was "melting hot," and so it was on our return; while at Provincetown it was delightfully breezy and cool by day, and almost too much so at night. This fact, connected with its other attractions, speaks volumes in favor of the place as a resort during the oppressive heat of summer.

As we passed down the Cape in the night, and wound along its narrow belt of land, we could sometimes see the bright sparkle of the light-houses on both sides of the cars, which, by a constant change in their number and position, produced a novel and pleasing sight.

Several of the towns we passed through appeared attractive and prosperous, and the people that were constantly getting on and off the cars were unusually intelligent and courteous in their manners.

It was evident that while some of the people of Cape Cod cultivated the soil, poor as it is, the far greater portion are "farmers of the sea." The banks in which their treasures are largely deposited are the Grand Banks of Newfoundland, with a perpetual "savings fund" along their own shores. Yet they have large amounts laid up in the usual way. It is claimed that there are no poor people in the sense of beggary or want on the "Cape." Provincetown is a rich place, and it is by no means the only wealthy town on the peninsula. The whole distance, from Boston to

the extreme end of Cape Cod, measured by the railroad, is in round numbers one hundred and twenty miles.

We have alluded to HYANNIS. It is situated on a small but beautiful bay leading out of Nantucket Sound, on the south side of the Cape, at the end of a spur of the old Colony Railroad, some four miles long, and has one of the prettiest locations along the coast.

Its site is a group of gentle hills, which might be described as rolling table-land. It has some twenty neat and tasty cottages of differing styles, every one of which has a delightful location and cheerful, homelike aspect. The only hotel of this cozy little hamlet is the "Hallet House," which accommodates for about one hundred; and it is remarkably pleasant, clean and well furnished, and kept, with very low rates. The proprietor, whose name is the same as that of the house, like the majority of those you meet on the Cape, was a sea captain. It is very much as one gentleman remarked in reference to Nantucket and Martha's Vineyard: "If you address ten men whom you chance to meet as 'Captain,' you will be likely to hit it right in nine cases out of the ten." Hyannis is a little less than eighty miles from Boston, is about five years old, has excellent bathing facilities, with no mosquitoes, and a more cozy and attractive little place can hardly be found in all the "nooks and corners" of the sea-coast of New England.

At Cohasset Narrows, fifty-four miles from Boston, a railroad branches from the Old Colony Railroad to Wood's Holl, seventeen miles, and connecting with steamers of the Old Colony Railroad line takes you to Oak Bluffs, which is seventy-eight miles from Boston. We had read much, and seen many flaming advertisements of this place, some of which were not very judiciously written, and had come to the conclusion that it was either a place of much merit, or a great piece of deception. Happily, our disappointment or realization was on the bright and favorable side; for we never like to censure or appear to underrate persons or places, but prefer to do so, rather than to swerve from the truth or mislead the public. Our motto is:

To praise where we can  
Censure where we must.

OAK BLUFFS exceeded our anticipation, if what we had read and heard could be relied on as the unvarnished truth. Its location, the facilities

for enjoyment and rest, the buildings and the society far exceeded our expectations. The ride over the Sound, of seven miles, is a most delightful one, and as you approach the place by water, the varying aspects of the town, with the charming views of land and water, are calculated to prepossess one in its favor, and the more you inspect its attractions and elements of future growth the more favorable are your impressions. The island on which it is located is peculiar in location, topography and history.

Martha's Vineyard and Nantucket are as completely isolated from the mainland of Massachusetts, as Ireland and Great Britain are from the continent of Europe. Their geologic and climatic conditions, and many of the national productions, differ widely from those of the State at large. On the "Vineyard," the wild deer roam at large, and the prairie-hen, sometimes called the "heath-hen," is found in considerable numbers, a fact in natural history which we believe is true of no other portion of New England. The entire region about Katama, some eight or nine miles from Oak Bluffs, looks so much like a Western prairie, that if one were set down in its midst without knowing where he was, he would beyond doubt suppose himself in one of the prairies of the great West. The resemblance is "very striking."

There are five small towns on the island with a population of about four thousand. Oak Bluffs is situated in Edgartown, which has a village of the same name, about five miles from the former, a well-built, solid place, and quite a summer resort.

The "Vineyard" is so entirely separated from the rest of the State that it is made to constitute a county by itself (Dukes), small as the population is, Edgartown being the county seat. In the winter season, their only communication with the mainland is by steamer three times a week. As the permanent population increases, especially at the "Bluffs," the trips of the boat will probably become daily, except during the prevalence of severe storms, or obstructions from ice.

Oak Bluffs, taken in its largest sense, is made up of three leading elements and three distinct sections—the Wesleyan Camp Ground, Vineyard

Grove, including the Baptist Camp Ground, and Oak Bluffs proper. The first is not a rude camping-ground in the wild woods, occupied by a limited number of board shanties and in the season of camp-meetings by a still larger number of tents; but it is an immense village in a grove, laid out upon the principles of rural art and architecture, with fine streets, and some seven or eight hundred handsome cottages abounding in everything that can minister to the comfort or taste of man. The style of architecture in these, is the very embodiment of elegance and taste, and the streets range in such a manner, whether in straight lines

DRIVING ON THE BOULEVARD, MARTHA'S VINEYARD.

or curves, as to give the finest effect to each residence separately, and in their combined effect. When this camp ground, or rather beautiful rural village, and the adjoining streets upon the Bluffs are fully lighted up, as is the custom during the meetings in the month of August, the effect is said to be picturesque and brilliant beyond description. Most of these beautiful and comfortable cottages are occupied during the hot season either by the owners or persons to whom they rent them. Some rent theirs till camp-meeting time and then occupy them themselves; and in other instances, where both families are small, they come in during the time of the meeting much like other guests. They of course take much less for the rent of their cottages on account of this reserved privilege. They are usually furnished by the owners. This portion of Oak Bluffs was commenced about thirty years since, although much of it has been built within the last few years.

West of the Wesleyan camp ground the Baptists also have a camp ground and have made a good beginning towards building up a beautiful rural town for summer residence, and perhaps ultimately for permanent occupancy. The site was formerly owned by the "Vineyard Grove Company," and purchased of them by a number of prominent persons of the Baptist church in 1875, under the name of "The Baptist Vineyard Association," and a number of cottages erected the first year. The site is a high and attractive one, better we think than that of their Methodist brethren. Between the two "camps" there is a fine lake,

SEA VIEW HOUSE, MARTHA'S VINEYARD.

nearly or quite fresh, though it at one time evidently belonged to the great ocean, which, with its big heart and strong impulses, every now and then pours into it numerous big drops of "joy and consolation." This lake is doubtless a bond of union and peace between the two denominations, for the good Baptist can "dip" himself in its clear waters till all his hardness of thought, if he has any, and other sins are "buried" in them; and his Methodist friends, if perchance their anger should wax hot at any time, can cool their passions in these fair and peaceful waters, so that nothing that is not loving and lovely shall ever reach the "Highlands" beyond, occupied by their Baptist brethren. It seems almost singular that the latter denomination should hold camp-meetings, though the Presbyterians of the West have done so, this peculiarly American custom having originated with two persons in Kentucky, a Pres-

byterian and Methodist who were brothers. It seems at first a little strange, too, that the Methodists should wish to have a Baptist association on their border, and should sell to them the land for building upon. But the explanation is—that religious denominations harmonize now much better than formerly; that, as a Methodist gentleman remarked, "They had much rather have on their border a body of godly and temperate men than to have to stand watch and ward against other classes of the community far less orderly and peaceable."

As to the "Gentiles" who occupy Oak Bluffs proper, "outsiders" as they are sometimes called, we think they are a very peaceable and respectable people. There is the most intimate and friendly intercourse between the different branches of this community, and it would be difficult to tell the difference between those outside and within the "sacred enclosures." Essentially they are one community, and blend and harmonize in most respects admirably.

We saw nothing of that great "impassable wall" between the two classes, the religious and those of mixed views, which some writers have referred to and so vividly described. All this separation and difference existed chiefly in the imagination of the writers,

though doubtless the contrast may seem greater in time of the meetings. These generally continue one week, occupying the last part of August, those of the Baptists being held first.

But we were speaking of Oak Bluffs proper, or that part of this "Cottage City" bordering upon the Bay and occupied promiscuously by the world's people somewhat after the simile of the fish gathered into the net; or "the wheat and the tares." The site is very feasible and beautiful, unsurpassed, in fact, the walks along its borders next to the ocean having no equal, within our knowledge, except that of "The Cliffs" at Newport.

The cottages are numerous, large and attractive in the highest degree, many of them, in fact, being spacious, tasty and expensive mansions. Here too, most of the large and well-appointed hotels are located, including the "Sea View,"

the "Pawnee House," "Island House," "Grover House," and others too numerous to mention. The "Highland House," a large and well conducted hotel, formerly upon the European, but now upon the American plan, is situated upon the Vineyard Grove bluff, adjacent to the Baptist camp grounds. It is finely located and, next to the Sea View, the largest hotel and most prominent object when you approach the place by boat. But the hotel of Oak Bluffs and of this great watering-place is the SEA VIEW HOUSE. Its site is in the most prominent part of the town, and whichever way you approach the place this house forms a conspicuous and attractive object to the vision. It is nearly three hundred feet in length, four stories high, has some two hundred rooms, and a fine imposing tower at each end. It looks as represented in the engraving, only much better, as all well-built structures do. Its situation is directly upon the ocean shore, on the very water's edge, and the views it affords of the Bay as taken in at one commanding sweep, of its mirror-like face, adorned with hundreds of sail, or by a more minute inspection of the numerous coves and headlands of the near and remote shores, and the beautiful islands that seem to repose peacefully upon its waters—are not only magnificent and of never-tiring interest to the gazer, but the gently lashing strokes and soft gurgle of the waves as they touch the shore, and the low murmur of their more distant and subdued voice, form a chorus soft and sweet as the lullabies of childhood, and that comes gratefully and soothingly to the ears of the guest to woo him to sleep.

We have listened to this music of the night-waves till, charmed and lulled by its sweet sound and borne upward upon the wings of the imagination, we were locked fast in the embrace of Morpheus and the oblivious, healing power of "balmy sleep." The beautiful walk fronting the sea, of which we have spoken, leads directly from this hotel. It was built five years ago, in the most thorough and substantial manner, and furnished with every convenience that the most exacting could wish. It has been under the man-

agement of the present proprietor, Mr. H. M. Brownell, from the start. Mr. Brownell is also proprietor of the Parker House, at New Bedford, the "Sea View" being kept open only during the summer months; and to say that he understands the business and proper standard of a first-class hotel keeper, as very few do, would be only intimating what might be said, but which we forbear to put in words, lest it might be regarded as the language of extravagant praise. This hotel is run upon the American plan, the prices being as low as the accommodations will warrant. All the others, thirteen inclusive, except the Highland

MATTAKESSET LODGE, KATAMA, MARTHA'S VINEYARD.

House, are conducted wholly or partly upon the European plan. The Grover House is a group of cottages, with a central house for cooking and supplies, and also for the entertainment of transient guests. It is run upon both the European and American principle. This arrangement has become a settled institution at Newport, as we have seen, and may become so at Oak Bluffs. Of course the hotel keepers here, as in other places, have felt the stress of times that has shaken the whole country and greatly tried business men of all kinds, for the last four years.

But one great drawback to individual success here is, that there are so many engaged in the business, and the patronage of the travelling public is still further divided up and shared by any number of boarding-houses. At Oak Bluffs and vicinity, there are not less than twenty public houses, that are most of them large establishments and claim to be first-class, while the number of places that entertain in one way or another can hardly be counted. In view of these two great facts, can it

be expected that all the hotels will be full, or make large profits while the times remain as they are? The number who visit Martha's Vineyard, and especially Oak Bluffs, even now, is immense; and if the people here who seek the custom of the travelling public and draw it away from the hotels, had other business, or if most of those who own or rent cottages occupied them for their own enjoyment merely, the public houses would do a very large business and make reasonable profits. If it be said that tourists and summer boarders have the advantage of great competition—we answer—it is more likely to prove a "scrub-race" to see which will draw most from a given number. There is only so much patronage to be shared by many, and each one must ask good round prices to live at all. We have said this much to show why it should not be expected that all the hotels of the Vineyard shall be full, and that because they are not, the number of visitors to "The Island" is not necessarily small or really falling off.

Some eight or nine miles below Oak Bluffs is the place marked on the maps as "KATAMA." It is simply a point upon a beautiful bay that makes in from Nantucket Sound, with fine views, good fishing, sailing, etc., and one of the best constructed and arranged hotels in the country; while back of it and along the bay, there is any amount of feasible and attractive sites for cottages. The hotel, whose special name is "Mattakeset Lodge," was erected two years ago, and it has had to contend with the stress of the times, its somewhat greater distance from the centres of travel and the drawbacks of all new enterprises. With good times and good management, this point and the hotel, around which other enterprises may crystallize, should draw largely upon the interest and patronage of the travelling public.

A fine narrow gauge railroad connects this place with Edgartown and Oak Bluffs, and steamboats ply here when the travel warrants it. To the superintendent of this railroad, Mr. Carpenter, we are indebted for many courtesies and much that is here given to the public respecting Katama.

We have spoken only of those portions of Martha's Vineyard which we visited. Other parts are no doubt interesting in many respects, although they are not, with the exception of Vineyard Haven, to any great extent places of summer resort.

In concluding our sketch of "The Vineyard,"

we may say truthfully, that it has many attractions, whether we consider the route to it, and the excellent facilities there hitherto, the beauty of its surface, the ocean views and privileges, the fine places that have been built up and opened to the public, the superior accommodations and means of transport that have been provided, and the comfort and pleasure of the tourist.

As to Oak Bluffs, with its great number of class hotels, its countless cottages, beautiful abodes of fairy land, its excellent society, intelligent, and high toned, yet reasonably democratic, and kindly disposed to all, and the safest shore for bathing almost on the coast—it is the most beautiful of the seacoast of Massachusetts, unless it be Nahant, a judgment, all things considered, the most attractive place on her entire coast. We may say in the language of one of old, "The half had told me." We should have mentioned that the area of Martha's Vineyard is about one hundred and twenty-five square miles, while its population is hardly equal to that of its sister island.

NANTUCKET has become a great favorite with many who are fond of the "sports of the sea." It is an island of peculiar shape, and nearly one-fifth as large as its sister, Martha's Vineyard, containing, as it does, some forty-eight square miles. It has another peculiarity, given it by the folly of man—it is nearly treeless. It is an early date stripped of its timber, which has been high stripped it of its population also. It has been the efforts of its inhabitants to reforest the island with trees—with those forest trees that are the glory and beauty of the world, and without which a portion of it is truly called a "desert." The efforts of these unfortunate Nantucket people only remind one of the trials of the old man who seeks to remove his baldness; and of the woman of beauty who has destroyed her "good looks" by cosmetics, and perhaps her health also, by the efforts she has taken to make her look fair and young. Yet the thing is possible; and we can hope that the good people of that island, that instead of laughing at others in the laugh at their expense, will show them the greatest sympathy; and we wish that those who think they can plant a tree better than these islanders, that they can plant a new one, or sail a boat, in a way that would put a blush on the cheek of the blushing; and that their forefathers would

a harpoon in the back of a whale so as to shame the world.

Nantucket was once the greatest "whaling" place on either continent, but the Revolutionary War destroyed it. It was partially recovered, when a great fire in 1846, together with the decline in the whale fishery, nearly ruined the business enterprise of the place. The people are now chiefly engaged in the coast fisheries.

Of late the island has become noted as a summer resort. It is about thirty miles from Martha's Vineyard, and the boats of the Old Colony Railroad make daily trips hither during the season of pleasure, and we believe, also less frequent trips throughout the winter.

We spent but a short time here, and our description shall be correspondingly brief. We find, however, that those who try this place are generally much pleased with it as a salt-water resort. In aquatic sports and feats they ought to, and we presume do, excel the whole coast except Provincetown. We saw, as we entered the harbor, one of their fair daughters rowing a boat, and moving over the waters as gracefully as a swan or a duck, and no doubt she was a *dear*, if not a *duck*—a widow, we presume, as she was dressed in black. She has perhaps

taken up the oar that her husband laid down. Nantucket is an old town, with streets not very wide and somewhat irregular, but it has many good buildings and an air of solidity in all things. There is evidently wealth here yet, and with the introduction of manufactures and other enterprises of "the plow, the loom, and the anvil," they might recover their prosperity, and more than eclipse their ancient renown. They should imitate Plymouth, of which we shall speak soon, for while railroads cannot yet cross the bay, water transportation is the cheapest of all. Take one line of industry, root culture, sugar-producing beets, for instance, and the whole island could be made a garden, and the wealth and population increased tenfold in ten years.

Nantucket, like Martha's Vineyard, constitutes a county of itself, and has its court-house and jail, like the largest counties, though its population is

but a little over four thousand. It has paved streets, a good landing, and a broad thoroughfare leading to the town, of which a fine representation is herewith given in the engraving. The other view representing that part of the town bordering upon the water, is also "true to the life." There are four or more hotels in the place, all but one of which are for summer boarders. The Ocean House is the most noted, and is nearest to the landing.

One thing we missed here. We did not see the traditional cart, driven by some fair one, and

CAMP-GROUND COTTAGES AT MARTHA'S VINEYARD.

backed up to the door of her lover or some lady friend, and the challenge or invitation—according to the party—given for a ride. But we saw the more graceful, and possibly more useful feat of rowing, as it hints at fish, fees, or fun, which we have already described. Our passage to and from Nantucket was a little rough.

The return trip across the sound, from Oak Bluffs to Wood's Holl, or as our vulgar forefathers called it, "Holmes' Hole," if we mistake not, was a most enjoyable one, as the outward trip had been. So, too, the ride up and down Buzzard's Bay, or rather, next to it, is delightful, with the many smooth tiny headlands and little miniature bays that skirt almost its entire border, and are constantly appearing and disappearing upon the sight. We predict that in a few years this beautiful bay, with a very ugly name, will be bordered by little seaside hamlets for summer resorts.

There are several such already started, and among them Pocasset, the Falmouths, and Wood's Holl. At the latter there are three or four hotels. One of these, the Webster House, we visited. It is a plain, comfortable hotel, beautifully located, well arranged, and well patronized. The house is on a gentle eminence, at the foot of which a cove sets in, with a cosy little landing right at the very door. The whole region about the "Holl" is slightly and picturesque, abounding in delightful locations.

Let none suppose from the few places we here describe, situated on the coast of Massachusetts, and more especially along that great bay from which the grand old Commonwealth derives its name of "The Bay State," that we affect to include all her seaside watering-places or even all the best ones. "Their name is legion," and we only give those selected for description as "sample goods." The whole shore, in fact, beginning at the eastern boundaries of Rhode Island, and circling around Buzzard's Bay, whose curiously scalloped border of land and water, as beautiful as a fair lady encircled with a snowy ruffle, can hardly be surpassed; and passing along Nantucket Sound, up the Atlantic, and around the great Bay of Cape Cod to Boston, and so east of it towards New Hampshire and Maine, including the beautiful Nahant and kindred places—is one extended seaside resort. Almost every part of this coast, several hundred miles in extent, which originally made Massachusetts a commercial people and a power in the earth, and has been the primary school of our navy, supplying to a great extent our men-of-war and our merchant marine with as brave and hardy seamen as ever donned a tarpaulin, climbed a mast or manned a gun—every part of this coast, we say, is dotted more or less continuously with seaside resorts, hamlets, hotels, and fishermen's huts or farm-houses, where one can enjoy the sports and sanitary benefits of the ocean to his heart's content. In the meanwhile, he can be in a retirement and solitude that would satisfy a Selkirk, or move with a throng of people and disport himself among exquisites and the moths and butterflies of fashion. Best of all, at the seaside resorts of Massachusetts one is among a nautical people—old "salts" or amateur sailors from childhood—who know how to set a sail, handle the oars or steer a craft from a skiff to a skipper, from a yawl to a merchantman or man-of-war, with that ease and certainty that can only

come from the most thorough knowledge and long experience. These men know how danger and how to meet it when it comes ashore too has a pebbly bottom, and who is comparatively free from surf or treacherous quicksands. Hence there is not a tithe of accidents or liability of them, on such a coast as among such a people, that there is in most other parts, and we seldom or never hear of those sad individuals and whole families being drowned here, as have made Atlantic City, Long Branch, and other resorts of our coast, the terror of visitors.

The whole shore from Boston to Cape Cod, proper, is gradually becoming a continuous seaside resort. The lower portion of this coast, spoken of as a part of "the Cape Region," is reached by the Old Colony Railroad and the Cape Cod, which it controls, the main route extending to Plymouth. Hence, the name "Old Colony" is applied to a road that has now over three hundred miles of track, and with its connecting roads, steamers, probably controls fully one half of the miles of important routes, furnishing all the sole facilities of public travel for all south of Massachusetts, or that portion of the State, as we have seen, bounded by a line from Fall River to the "Hub," with many important connections in both directions. Here, too, we have the origin of the famous "River Line" of steamers, a name which is unfrequently applied by the public to this part of the railroad.

There are two routes to Plymouth, as we have intimated—one by way of "Duxbury" and the other "Abington." The former is the one that runs along the coast. As we pass out of the depot in Boston, which, by the way, we should mention is at the junction of Kneeland and South Streets, the views and glimpses of Boston Bay, the islands, headlands and forts, and their constantly shifting aspects, are charming, and we cease to peer out of the car windows and enjoy the delightful scenes. There are some many attractive places along this coast, the principal of which, are Quincy, Hingham, Cohasset, Scituate, Marshfield, Duxbury and Plymouth. Scituate alone has nearly twenty hotels, which are for summer boarders. Hingham, an old and beautiful town, has much wealth and many fine buildings, and it being only twenty miles from Boston, is a great place both

and residence. But as we spent most of our time at Plymouth, Marshfield and Quincy, we shall confine what we say in this connection chiefly to these places.

Plymouth has been written and spoken to the American people so fully, that most of them know its history by heart. Not much can be added to the great thoughts and eloquent language in which Everett, Choate, and Webster have clothed that history. We shall touch chiefly upon its present aspects, and especially as a summer resort. Most

admirers of the illustrious names and deeds of the past, but not described.

A magnificent monument, the finest we think that we have ever seen, has been erected upon a hill overlooking the town and harbor and dedicated to THE FOREFATHERS, the front side facing the very spot where the Pilgrims must have sailed into port, in the IMMORTAL MAYFLOWER. It is of light granite, in the form of an ornate cross inverted, upon the massive arms or projecting sides of which, four groups of statuary of appropriate

NANTUCKET WHARF—ARRIVAL OF  
STEAMBOAT.

designs are to be placed, and the top crowned with a colossal figure of FAITH. The statue is forty feet in height, and the whole structure about one hundred.

of those who visit Plymouth go there to spend the day only; though not a few tarry a part or all of the summer. Of the former, there is a multitude, most of whom are drawn here from its historic associations. All of course inspect "Burial Hill," "Pilgrim Hall" and "Plymouth Rock." A portion of the rock has been removed to the front of Pilgrim Hall, fenced in, and the railing inscribed with the names of the voyagers of the Mayflower. The solid part of the rock has been smoothed off and a beautiful pavilion of polished Quincy granite erected over it, at a cost of nearly forty thousand dollars. Pilgrim Hall, on Court street, is rich in relics of the forefathers, both of the Pilgrims and early settlers. These can be seen and enjoyed by the lovers of their country and the

It is now nearly complete, and is not only a worthy and appropriate memorial to men whose fame indeed is secure without it, but will constitute for all time a conspicuous and attractive object, and the chief point of interest for all visitors.

The place itself is a grand old town, whose broad streets and spacious, solid edifices, and fine shade trees, are in keeping with its noble origin and historic renown. It is also a place of business prosperity. It does not live in "the dead past," nor has it gone to seed or mildew and decay, like some other ancient towns of our country. It has a population of nearly eight thousand, which is yearly increasing, and a great amount and variety of manufactures, besides its

fishing and commercial enterprises. The principal hotel of the place for tourists and summer boarders, is the Samoset House. It is delightfully located near the Old Colony Railroad depot, and is a large, exceedingly pleasant and well-appointed house. Plymouth is forty-six miles from Boston, and the trains are so arranged as to give the visitor the greater part of the day, or he can stop over as long as he sees fit.

In visiting a spot like MARSHFIELD, where rests the remains of the greatest statesman of America,

pressed every beholder, stamping him in the estimation of his fellow-men as one in whom all the gifts combined to make a MAN, and gaining for him the significant appellation of "the god-like Daniel;" here his earthly part, slowly mingling with its kindred dust, shall await the final resurrection. Mr. Webster's farm at first contained over sixteen hundred acres, only three hundred of which remain in the family name. Everything about the premises is in keeping with the character of the man—the immense fields, the solid stone

NANTUCKET AS VIEWED FROM THE CHURCH TOWER.

one's difficulty is not respecting what to say but what to omit.

We stopped there on our return from Plymouth, and visited the mansion and tomb of WEBSTER, spending the night in the vicinity. Here THE GREAT STATESMAN spent more than twenty years of his life. Here he farmed his broad acres, mingled in friendly intercourse with his neighbors, received distinguished visitors of every land, and here he wrote those celebrated documents of State that will live as long as his country and the English language shall live; and here, too, he laid down his noble manhood and the great trust his Creator had committed to his keeping in those remarkable gifts of person and of intellect, which, in connection with the worthy public uses to which they had been devoted, im-

walls, the great sweep of land and water and the commanding view which the eminence above his house affords, and the grand old mansion itself with the bright green sward in front of it, where his noble red oxen passed the owner's inspection just before he went to be reviewed by the King of Kings; and after uttering the immortal words "I still live," closed his eyes forever upon earth.

Webster's tomb is the very simplicity of plainness, occupying a corner of an ordinary country burying-ground, which was once probably a part of his own great farm. His dust thus mingled with the lowly, as he did in person when living with the humblest of his neighbors. All his family who have died, rest near him. The wife of his son Fletcher Webster, and a grandson, stay at the homestead most of the time, and are, we believe,

all that remain of his family, except his second wife, who lives in New York.

As we stood by the tomb of the great man, the most illustrious son of Massachusetts, and the greatest of American Statesmen, what thoughts came up from the past! How vividly his history passes in review before us! his early struggles and career at Dartmouth, his *début* as a great criminal and forensic lawyer, his wonderful career and remarkable efforts in the United States Senate—efforts that won for him the title of "Expounder of the Constitution," and stamped him as one of the greatest orators of modern times. We seem to see, too, those other great statesmen, Clay, Calhoun, Benton, Silas Wright and Hayne, with whom he contended for the intellectual mastery, and for the success of weighty principles, as one strong man contends with another. "There were giants in those days."

We learned many interesting facts from his neighbors and those who had lived with him, concerning Mr. Webster's personal habits, which we had intended to give, but want of space forbids. None of these were more pleasing to us, or showed his greatness in a truer light, than the remark that "there was no kinder neighbor or better man to work for than he;" and the tribute, uttered with great emphasis—"They never saw so great a man and so noble looking a person as he." The verdict of his neighbors is the verdict of his countrymen; of all who ever saw and heard him!

Marshfield is also noted as a watering-place, having several hotels for summer boarders, and a

broad smooth beach nine miles in length, which is considered one of the finest on the coast. While here we had the pleasure of meeting Miss Adelaide Phillips, the celebrated singer.

We made a short stop at Quincy, to inspect for the first time the old family residence of the Adams family. We saw the room where tradition says the elder Adams was born, and somewhere in the same house John Quincy Adams, the greatest of them all, first saw the light. Near by is a mansion where we believe Charles Francis Adams had his birth. Both are very plain structures, poorly located, and few farmers in good circumstances would be willing to make either of them his home. Charles Francis Adams, whom all will remember as the grandson of John Adams of Revolutionary fame, lives in an elegant mansion nearer Boston. It is a remarkable family, all things considered, great talents running through four or more generations.

We returned by way of Boston, Newport and New York, having inspected many places besides those described, and travelled over one thousand miles, all of it over the "Old Colony" and "North Pennsylvania" Railroads and their connections, without the slightest accident, interruption or annoyance of any kind, highly enjoying the trip with its delightful scenes and pleasant incidents.

We hope our readers will receive an equal amount of pleasure in perusing these sketches, and that it will excite in them a desire to visit the same attractive resorts.

### MY MARTIN MATINEE.

WHEN the dim, dull hours of later day  
Throw shimmer and shade in my quiet room,  
And my work has slipped from my hands away,  
Half in gladness, and half in gloom,  
I yield myself to the dreamy hour,  
And drift away in the tender spell,  
And forget for awhile in the witching power,  
That the world to me be ill or well.  
And the martin's sing on the wall close by,  
And their shattered songs drift down to me,  
And fill my heart with such tender thoughts,  
With their loving and broken minstrelsy;  
Tender and sad the thoughts they bring,  
And I tearfully think them o'er again,  
And lovingly linger where one gives joy,  
And sadly hasten, where one gives pain.  
O, Birdies! you bring to my tired life  
Such happy thoughts of the old time day,  
When December was lost in a maze of joy,  
And the whole year round was a year of May.

When summer and winter were all the same,  
And the days would bud, and the seasons blow,  
And the fields would harvest but joy to me,  
Whether covered with daisies or drifted snow.  
Oh, Birdies! you make me go back again  
And tread on the graves of my buried years;  
And try as I will, my eyes grow dim  
And fill with sad and regretful tears;  
The martins sang in the old brown eaves  
Of my boyhood's home, and somehow, some way,  
You seem to me as the martins then,  
And I as the boy of that long past day.  
Let me whisper how happy the days went by;  
I remember them better than last night's dream,  
They were brimmed from beginning to end with joy,  
And seemed too happy but just to seem,  
Of good there was all that life could ask—  
A mother's love and a father's care,  
Brothers and sisters, two little graves,  
The morning hymn and the evening prayer.

## ARCHITECTURAL PROGRESS, AS SEEN IN THE RELIGIOUS EDIFICES OF THE WORLD.

By REV. WILLIAM BLACKWOOD, D.D., LL.D.

### VII. EUROPEAN CONTINENTAL CHURCHES—POINTED AND RENAISSANCE.

It has already been stated, that although the Pointed architecture, as well as the earlier Norman of England, was derived from the Continental, and chiefly from France, in consequence of the political and ecclesiastical relations which for centuries existed between these countries, yet the styles which prevailed in England were in many respects different from the forms which satisfied the taste of Continental builders. An educated eye, on looking at a large number of engravings, can at once say, *that is a Pointed edifice in the French style; that is German; that is Spanish; that is English; and these are Italian and Sicilian;* and yet all these specimens will display pointed windows and have other members which are found in one or other of the periods of the Pointed style. Germany has always been celebrated for its lofty spires, which rise to a great height, ascending out of a forest of pinnacles in a pyramidal form, and thus an effect is produced which is truly magnificent. Spanish edifices are varied in outline, but the tendency is towards horizontalism, and thus the eye is left unsatisfied; while in France there is an elaboration of ornament which is at once an evidence of the national sentiment; and these enrichments are often united to parts which are out of harmony with the style.

In no country in Europe have Pointed buildings suffered more than in France. Before 1790 there were one hundred and thirty-three bishops in France, and each had his cathedral; but the ravages of the revolutionary ferment were so extensive, that several of them were destroyed, some were reduced and turned into parish churches, some were overturned for sake of their materials,

some devoted to secular uses, while others were overthrown and afterwards rebuilt in another or other modern style. The cathedrals of Sens, Troyes, Meaux, Amiens, Reims, and Avranches were totally destroyed; at Senlis and Auxerre were turned into

churches, having been reduced to a small size; and thus the devastation went on, there are really few cathedrals of a large class in the country. As church property passed into the hands of the State, and as all the churches which the government wished to raise, has been required to sustain a huge standing army, and to meet the outlay consequent on the great changes which so frequently take place in France, there has been no provision made to restore the edifices which have been spared. The great churches that remain are splendid specimens of the Pointed style, and they display very gorgeous features of the study of the architecture and illustrative of the style which prevailed when they were erected.

GABLE OF THE CATHEDRAL OF COLOGNE.

Antiquaries have not decided the questions that for ages have been discussed respecting the place in which the Pointed style had its origin, but in France it is generally held to have originated in the twelfth century, and its differences appear to have been known there before they were adopted in England; for the "English" is somewhat later than the "French," and so was it with the "Early English." The Abbey Church of St. Denis at Paris is one of the earliest of the French Pointed edifices; and it appears to have been built A.D., 1137, and at the same time the Church of the Knights Templar at Paris was built. Some years afterwards the Abbey of St. Pere at

was built by a monk, and about the same time the Bishop of Paris began the eastern end of the Church of Notre Dame in Paris, but many interruptions and great delays prevented the completion of the church for two centuries. Contemporaneous with these structures were the eastern end of the Cathedral of Lyons, and the great Church of St. Nicholas at Amiens.

The thirteenth century, however, was the brightest period of ecclesiastical architecture in France. As has been truly said by the author of the "Ecclesiastical Antiquities of France," when describing the buildings of this period: "Everything seemed to conspire in the circumstances of the nation and of the world to produce an interval favorable for the cultivation of the arts; and genius and talents were not wanting to make use of the happy opportunity. The thirteenth century found the French artists a numerous and protected body, in possession of a new and beautiful style of building; the religious enthusiasm of

VOL. IX.—7

CATHEDRAL OF REGENSBURG.

CATHEDRAL OF BURGOS.

the times, formed by the spirit of the Crusades, was at its height, and the throne of France was filled by monarchs equally distinguished by their piety and magnificence. The dissensions between the barons and their sovereign which agitated England during the greater part of this century, increased the power, and ensured the tranquility of France. Thus were external circumstances no less favorable to the prevailing taste, and its triumph was proportionably brilliant. The most

in the fourteenth and fifteenth centuries. Peasantry were drafted from the soil, the cities in towns were burdened with taxes, and districts were laid waste, and as the sovereigns were compelled to use their finances on festivities instead of objects of taste and art, it is no wonder that architecture then declined.

It has been stated in these papers that French and English churches have features in common, but in certain respects they are character-

sumptuous churches now adorn the French soil. They are the work of this age, while their extraordinary beauty renders them interesting objects of curiosity. It is now possible to acquire of them accurate knowledge, and the names of their architects is singularly important to the illustration of our antiquities and the history of Gothic Architecture." During this century churches were built in great numbers in France, and among them was the Cathedral at Rheims, which by some enthusiastic writers has been pronounced the finest Gothic church in France.

As early as A.D. 1300, the decline of Pointed Architecture had commenced in France, and for two hundred years there were few indications of genius presented among the architects of the country. The invasion of France by the armies that penetrated into the heart of the country, the divisions and strifes of the nobles, the defeats of the monarchs, the want of industry and the insecurity prevailed on every side, account for the stagnation and decline of art, which marked the history of

PRINCIPAL FRONT OF THE CATHEDRAL OF NOTRE DAME, PARIS.

different. In the northern part of France cathedrals have almost universally an octagonal or semicircular apse at the east end, whereas in English churches the east end is generally finished by a regular gable, having as in York, Lincoln,

Carlisle, Gloucester and elsewhere, a magnificent eastern window; and in Ely, the Cathedral at Glasgow, the Temple Church in London, the Abbey Church, Romsey, and similar buildings, a flat gable with early pointed windows of the

period when they were built. With a few exceptions, French cathedrals, like those in England, are built in the form of a Latin cross, but in some, the plan was not carried out; the transepts having never been erected, and in a few cases the nave was omitted, probably for want of funds when the other parts were erected. At Blois the choir only was built, and there is neither nave nor transept, the whole consisting merely of the choir. The troubles of the period when they were built, the want of means in the hands of their founders and the apathy of succeeding ages will account for these anomalies. The transepts of French cathedrals are much shorter than those of English, but they are very elaborate in their enrichment. The entrances to the churches are exceedingly imposing, the porches being deep, abundantly ornamented with statues, and the apex of the porch rising aloft so as to appear to cover a part of the windows in the entrance gable. The double transepts as at Salisbury, at Lincoln, and others of the great English, are rarely seen in France, in fact they scarcely exist; and the massive towers with the lofty spires which rise in English cathedrals from the intersection of the nave, the choir and the transepts, are usually wanting in France. At York, at Gloucester, at Canterbury, Hereford Wells, the Abbey at Bath and similar

churches the lofty massive central towers give character to these edifices. Winchester and Westminster Abbey, notwithstanding their great length, suffer from the low dumpy form of the central towers, which do not satisfy the eye; while at Salisbury, Lichfield, Chichester, Norwich, Glas-

gow, the steeple rising grandly out of the central tower, carries the eye up and forms a lofty crown to the whole edifice. Of the French cathedrals have double

CATHEDRAL AT AMIENS.

each side of the nave, and this presents the appearance of greater breadth and spaciousness while some of the French churches are usually shorter than the English cathedrals. In one important feature the French cathedrals differ from the English churches. They are much less

height is an essential element of beauty in all the periods of the Pointed style; so also the circular or wheel windows over the western portals and in the transepts of French churches are usually

Decorated, the tracery in the heads of French windows assumed the forms known as the Flamboyant, the lines flowing into each other and then opening out again, and thus resembling the appearance of a flame.

CATHEDRAL AT RHEIMS.

larger and much more elaborate than similar openings in English structures. Changes of style took place in France in the same order as in England, and during the period of the English

ceedingly elaborate, with niches, statues and pinnacles, the flying buttresses being very conspicuous and profusely ornamented with carving.

An idea of the character of the roof may be

Chief among the great French churches are the Cathedrals of Amiens, Rheims and Rouen, and they all deserve the attention and study of amateurs. Amiens, on the way from Boulogne to Paris is, quite accessible to American and English travellers. It bears a similar relation to other French churches that Salisbury does to later English churches. That is, it was built all in one style and in a comparatively small number of years, being begun in A.D. 1220 and entirely finished in the same century. Externally it is far from being attractive, for it presents the appearance of a great huge square mass but little broken by the low turrets and spire, while the roof is about two hundred feet high; owing to the manner in which private houses enclose it, a good external view can only be had on the south side. On the west three enormous portals greatly enriched lead to the interior, and three porches are constructed on the south side, the principal one being at the end of the transept. The sculptures on these porches and on the western façade cover the walls, which are ex-

formed from the statement that it is so acute and lofty, that the apex is fifty feet perpendicular above the spring or at the level of the flank walls. The great beauty and magnificence of Amiens, however, is to be seen in its interior, which Dr.

so different from the familiar type of cathedrals. The proportion of height to width is almost double of that to which we are accustomed; the lofty solid piers which bear the height are far more massive in their plan than

light and graceful clusters of our English churches, of them being a cylindrical four engaged columns. The polygonal east apse is a feature which we seldom and nowhere so exhibit on such a scale; and the French arrangement puts the walls at the base of the buttresses and forms interior chapels round, in addition to the aisles, gives a vast multiplicity of perspective below, which fills out the idea produced by the gigantic height of the central space." Those who have stood in the nave of Westminster Abbey form some conception of the loftiness of Amiens when they are told that it is half again as the roof on which they have gazed with admiration and delight.

Rheims is a subject of controversy with critics, who admit that it is a rival of Amiens, while with Mr. Whittington that "the exterior of the Cathedral at Rheims is the most beautiful and complete piece of Gothic architecture in the world." This, however, is exaggerated.

CATHEDRAL AT FREIBERG, IN BREISGAU, GERMANY.

Whewell has correctly described as "one of the most magnificent spectacles that architectural skill has ever produced. The mind," he says, "is filled and elevated by its enormous height, its lofty and many colored clerestory windows, its grand proportions, its noble simplicity. To a person fresh from English edifices this effect is combined with surprise at finding a cathedral so complete and impressive, and yet in many respects

for it is a fact that all such structures have their own character, and they become standard in their own style. Peterborough in England and Rheims in France have been compared to each other, but there is no resemblance whatever between them except that they both have enormous lofty and elaborate triple portals on the western facade. In all other details they are entirely different. The proportion of the different parts is ex-

and the richness of the ornamentation at Rheims cannot be exceeded. It has not the square form of outline of English cathedrals, as the ascending lines become pyramidal, and thus the architect has displayed a correct feeling, showing that he thoroughly comprehended the character of the style. Not only is this cathedral exuberant in decoration, but it is as light and graceful as if clothed with ornament; while the solid parts are kept below, and the lighter and more airy members rise aloft, so that the judgment and the taste are equally satisfied. Unquestionably, if it be held that in steeples and the great effect which they produce when seen as they arise out of the central mass of the building, the English cathedrals excel, on the other hand, the portals of the French cathedrals must be awarded the palm for their vast size, their grandeur and the magnificence of their details. At Rouen the present cathedral is the fifth that has been built on the site which it occupies. Like other great French churches it has three western portals, and unlike English churches the towers at the angles of the western façade stand out beyond the line of the body of the church. The western façade is one hundred and seventy feet broad, and the central

GOLDEN PORCH OF FREIBERG CATHEDRAL.

portal stands out considerably, is loftier than the others, and is ornamented with buttresses which are lavishly decorated. Like other French churches,

the transepts are highly enriched, and the portals with the circular windows over them are so gorgeous, that they would be considered adequate to the dignity of the western end of a first-class church. This great church is sadly disfigured by the

crowding around it of mean houses and shops, from the chimneys of which the smoke may be seen rising against the windows and ascending in wreaths among the pinnacles and the tracery of the stone work.

German churches, as has been observed, excel in spires, but the body of the German church is usually plain, in many cases approaching to baldness. The lightness of French ornamentation is wanting. When the cathedral at Cologne is

finished, it will take its place before all other German churches, and if, when its breadth and height are considered, it were an hundred and fifty, or even two hundred feet longer, it would stand out as the noblest cathedral in the world. When the Perpendicular style became established in England, it gradually gave way to the debased Tudor in which the flattened arch, the lowered roof and the heterogeneous mixture which were introduced showed that taste had degenerated and that society was ready for a change. That change came from Italy, in which pure Gothic had never prevailed. Pointed forms had been used in Italy, but the national taste always leaned to the Romanesque. When the treatise of Vitruvius was exhumed in the monastery of St. Gall at Constance, Bracciolini, in A.D. 1417, where it had lain for centuries, it gave a powerful stimulus to the Italian mind that already had been led to abandon the Lombard and the Pointed styles by the influence of Brunelleschi. He lived from A.D. 1377 to A.D. 1414, and from his time these styles may be considered as extinct in Italy. When he began to design palaces for the Italian nobility, he abandoned the features of the Gothic period, and established that which has been known as the "Italian style." Different terms have been used to designate this style. Sometimes it has been called the Cinque-Cento, a term which literally means five hundred—a contraction for fifteen hundred—the century in which the change took place. It has been called the Revival, the Revived Classical and the Renaissance. The Italian style has been divided into three schools, the Florentine being

ning with Brunelleschi, about A.D. 1414, and closing A.D. 1600 with Amanti; the Roman commencing A.D. 1470 with Bramante, and ending A.D. 1607 with Fontana, and the Venetian, dating from A.D. 1500 to A.D. 1620, from San Micheli to Scamozzi. The material which different parts of the country supplied has been held to have affected these styles, as the heavy Florentine is traced to the great blocks of stone which were accessible and which made the Florentine palaces and houses so solid and solemn when compared with those in other parts of Italy. The Roman edifices were much lighter in character; columns were introduced, the entrance was made imposing, an arcade ran round an interior court, and a great stairway led to a large *sala* or reception hall. The Venetian was lighter still, and it abounded with columns, pilasters and arcades. Usually, a basement of rustic work formed a first or ground story, then a principal story with columns, arched corridors and an entablature surrounded and crowned the whole. The democratic character of the Venetians did not demand vast churches, great palaces for monarchs and nobles; and hence the villa style of Palladio soon came into favor, and was extensively adopted elsewhere, as well as in Italy, as being suitable for a mansion of taste and refinement. The

Renaissance soon established its suitability for palatial edifices, a fact that all travellers have seen

## THE AMAZONS OF MEXICO.

(FROM THE PEN OF A TOLTEC HISTORIAN.)

TRANSLATED BY ELIZABETH OAKES SMITH.

## CHAPTER I.

MALINKA was High Priestess in the great temple of Cholula. She was tall and shapely in person, with large, luminous eyes that penetrated the very marrow of those upon whom she fixed them. She presided over all the young acolytes, two thousand in number, who were brought to the temple for the purpose of taking part in the great religious ceremonies which formed a portion of the worship of the one invisible God, whom the Aztecs worshipped, but more truly to be victims to the lust of a corrupt priesthood.

There had been a day of public sacrifice. A beautiful youth, nobler, fairer than any of the people, had been immolated on the altar; and this youth Malinka loved most tenderly; he had been assigned to her as a sacred husband, whom to love was to ally herself and family to undying distinction; but Malinka had loved with a woman's love, and it had opened her eyes to something unexpected even to herself. It had been her office this day to remove the chaplet from the lovely head of the victim, and bare the handsome breast for the last terrible rite. Even there in the presence of the great multitude, she clasped him in her arms, whispering: "I too will die;" but he looked into her eyes, and answered:

"Go, Malinka, from this accursed place. Go, and bring forth our child from hence. Go, go; and God be with you."

His lips were cold, but his eyes were like flames of fire as he bade her farewell, uttering these words with a stern tenderness. It was many days before Malinka was able to arise from the agony of her grief, but at length she called the priests of the temple and bade them convene together all the women of the city to the great Pyramid of Cholula, and there she would reveal to them the will of God, which had been shown her in a night vision.

Now Malinka was not only beautiful in person, but ready of speech and wise to execute. She sent the maidens under her care whom she could best trust as discreet and virtuous, secretly to the women, and bade each to provide herself with spear-head

and arrows, with dried meats, and their most costly robes and jewels, and make themselves ready for a journey to the mountains at the source of the Great River, for thus was what is now called the Amazon and its tributaries known to the Aztecs.

Now the women of Cholula fostered a profound bitterness in their hearts, and this the Priestess knew, and knowing this she had determined what to do. She had but one fear, and that was, that some weak woman, more curious than wise, would bother her little head with surmises, and lay the matter before her husband, and he would carry it before the city authorities, and thus her plans be thwarted. But giants rarely find giants to co-operate with them, and must run the risk involved in the use of pigmies.

On the appointed day an immense multitude appeared at the call of the Priestess. Thousands and thousands of men lined the lattices and all the thoroughfares to the temple. Indeed, men of every grade, chiefs, warriors, priests, artisans, and laborers, all left their various avocations, intent upon learning what this vast gathering of the women might portend: some even insisted upon going with their wives, and daughters, and sisters, but the latter bade them retire with solemn earnestness, declaring that the divine powers must be obeyed.

Malinka commanded that guards should be placed at all the avenues to the temple, so that her will should be learned without molestation. Never was secret better kept. The thousands of women were possessed by one will and desire to follow the behest of one of the sex, acknowledged to be wiser than they all; and this was most surprising, as most of women will succumb to the tyranny of any man rather than yield to the supremacy of a woman. They each insist that they can do as well as another, and are unwilling to yield to the best, differing in this respect from men, who will co-operate and follow a leader.

Malinka stood upon one of the terraces of the great temple where she commanded a view of the vast multitude of her sex collected below, and

where her voice could be distinctly heard. She told them that Quetzalcoatl, the god of perpetual youth and beauty, fair as the moon, clear as the sun, with golden locks, and a smile that caused blossoms to spring from the earth, and birds to break into song, had come to her, and with a stern voice bade her call the women together and upbraid them for their cowardice, their sensuality, and their servitude. "They will barter their very soul," he cried, "for gold, and gems, and splendid robes. They are slaves to men through their vanity, their envy, their jealousy and malice. They grind them to dust by playing upon their evil passions and rivalries, and by ministering to their depraved love of finery and ease."

"What shall we do? what shall we do?" cried the women, stung to the quick. "What shall we do to win the favor of the beautiful god?"

Then Malinka looked upon them with a grave aspect, and told them what had been commanded.

The women had not forgotten to robe themselves in their best; their heads were crowned with chaplets, and under their robes they carried the stolen arms of their male associates. More than this, Malinka saw with delight that the multitude of slave women had come with their mistresses, and each carried the instruments of her toil.

The men had not failed to hear a portion of Malinka's words, but they saw not, nor understood the depth of their purport; and when the Priestess, descending the terrace, struck the cymbals, and with a measured dance went forth from the gates of the city, followed by the multitude of women singing in chorus, the men foolishly took up the strain and sang:

Hear the young god calling, calling,  
Rings his sweet voice loud and free,  
Sweet as dew on moss-bed falling, falling,  
Hear him call, come unto me.  
Follow, follow, one and all,  
Listen, listen to the call.

All the air is ringing, ringing,  
Leaps the young god like a roe,  
Or the dove when homeward winging, winging,  
Thus exultingly we go.  
Follow, follow, one and all,  
Listen, listen to the call.

It was curious to hear the men of the city join in the chorus, as it came more and more faintly to the ear, and to see them stretch their necks to catch a last gleam of the retreating petticoats.

[Here the manuscript is much worm-eaten, and could not be deciphered, but it was interlined by

a modern hand, with many venomous epithets about the contraptions of women and the dullness of husbands].

They had not proceeded many leagues to the south over the great plain of Cholula, when Malinka ordered a halt, and called a council of the oldest and wisest women who accompanied her. It was growing late also, and the people needed refreshment and rest. In this consultation Malinka unfolded her plans more fully than she had hitherto done, though she dared not explain all as yet, knowing that the women were unprepared for the great destiny to which she invoked them. The debate was somewhat stormy, for women are apt to distrust each other, and being often foreseeing, they cannot look to results; and in enterprises demanding time, combination, and patience, they grow weary, discontented, and at length their impatience culminates in a general break-up. Calmness and composure are little esteemed by them.

At length the council broke up, and the people settled themselves for slumber. The soft air was laden with the odors of roses and jasmine, and blew refreshingly over the sleepers, whose beautiful faces, half-shaded by their abundant dark hair, gleamed in the starry midnight, under the protection of the mighty constellation of the Southern Cross. No dew crept from the earth to molest them; the ever-burning flames from the distant mountain shot upward to the zenith, and innumerable fire-flies darted here and there, revealing now the closed lids of some careless maiden, and now the anxious open eyes of some noble matron to whom slumber would not come. Here and there some young wife tossed uncosily, for to her as yet the thornless rose had only been presented. Here sighed a girl for her lover, willing to take all the odds of life for one smile from a manly lip, and one sound of a voice, so loud, so tender, so much better than all the dreams of Priestess however inspired. Here and there a heavy hand fell upon a restless child, which gave forth a shrill cry, and then sobbed itself to rest. At length all was hushed, and only the low voice of a night bird, and the strange startling ring of the bell-bird came to the ear.

Malinka placed her sentinels to guard the sleepers, and, like a general in his camp, responsible for the well-being of the thousands under his command, was the last to betake herself to slumber.

How fared it this night in the great city of Cholula? A city of fifty thousand men, and only now and then an old servitor, or a girl child in all its precincts. The slaves spread viands before their masters, but a relish seemed wanting. Even those whose wives had been termagants began to feel that habit had made this interminable clatter of a woman's tongue necessary to them. Those who owned the milk-and-water kind of women, were better content, for men rather like a tonic, and grow tired of vapidness. It was not so much absolute discomfort that the men suffered, as the absence of something to stimulate the imagination, engage a little waste tenderness, or what was better still, something upon which to exercise a certain amount of spleen or ill nature, woman being the only available medium. Towards morning there was a general sense of exasperation; a feeling of baffled will not to be endured. What right had these women to go out of their own free will and leave the city emptied of torment, emptied of what was alike its plague and its joy. These women belonged to the men; they were too weak to fight; too imbecile to rule; they brought the State neither the wisdom to construct law nor the skill to build palaces; they composed not the songs that incited the warrior to battle, nor the hymns chanted in honor of the gods! They were unskilled in agriculture, and incapable of subduing the horse to the curb, or the bison to the yoke. Their pursuits were foolish, and their toil of no avail. As the men enumerated these disabilities of the sex a fierce yell of indignation rang through the City, and they poured into the great market place of Cholula in a storm of exasperation.

The Priests of the Temple, ill at ease themselves, appeared in procession and exhorted the men to patience. They represented that the women had gone forth at the command of the beautiful god Quetzalcoatl, and they must not interfere, for these Priests understood well that to indulge the men in their disposition to go forth and bring back the women by force of arms would be to diminish the influence of the hierarchy. Therefore they did not abuse the women, nor show their distrust of the whole movement. The great square resembled the buzz and fury of a nest of hornets, against which some idle boy had cast a stone. Now and then a lover bewailed upon his pipe of reeds the absence of his mistress, or some young boy deplored the fair girl for whom he had gath-

ered the humming-bird or fire-fly to place amid her jetty locks; but the men of whatever condition wandered about, sulky and watchful; those who really loved their wives and friends, irritated and indignant, and those that did not, raging violently at what looked like rebellion. Philosophers bore it more calmly, soldiers laughed in high glee, saying, "they will be glad to get back again," and those of common make solaced themselves with strong drink. It was noticeable that hardly a single man made his prayer to God this night.

As the Constellation of the great Cross waned at the approach of morning, the disconsolate and deserted men, little appreciating their freedom from the tricks, subterfuges, and irritations of women, sank into a disturbed slumber, in which many dreamed that the women had all returned, at which they were so frightened that they fled in dismay.

The glorious rays of the coming sun hardly slanted from the east, when there arose a sorrowful wailing from the great plain of Cholula. Looking forth, the men beheld a concourse of female slaves approaching with about a thousand young boys and boy-babies, which their mothers had taken with them on their hegira of the day before, and these unconscious little ones, either too young to understand what was going on or feeling in the marrow of their poor bones the sense of change and discomfort, were returning to the arms of their fathers, there to be coddled and comforted, fed and cared for as best they could. Some of the fathers took the poor things in their arms, and tenderly laid their heads upon their shoulders, while others gave them a kick or a slap, and bade them whist their noise.

It was noticeable that those who had loved and cherished their wives were the most tender to the little boys, while those that had hated them, for whatever reason, were the most violent and cruel, as if the evil passions their wives had engendered were extended to their children, and thus the reign of discord was extended.

At the council of which I have spoken, Malinka had taken the Lady Tula fully into her confidence, and it had been agreed by these and other wise women, that the boy children should all be returned to their fathers, as we have already seen. When the boys were collected together ready for departure, there was much excitement. Women looked at each other out of the corner of the eye, some turned the head, some drew down the corners

of the mouth to express their scorn and contempt; young girls shrugged their shoulders, and flirted their petticoats in a kind of blind derision, for they had not a single idea in their little brains. There was a general uprising, which was little understood how or why by any of them.

Malinka at length made her appearance, and her serene face quieted the women by a conscious harmony.

"My sisters," she said, "the beautiful god, sent by the great one God, has directed us to go on, we women alone, further into the wilderness, and he will come to us and explain what it is his will that we should do. He has seen that we are mere creatures for toil, for luxury and delusion. He sees we act from no sense of what God designed in us when he made us to be companions to man in this world; and he has called us forth that we may learn to do his will. He has bidden us to separate ourselves from all of the other sex, and by being alone we shall learn what we are good for in the world. For this reason we return all the boy children to their fathers."

"And I go with mine," cried a young woman with a loud voice, "and I go with mine," "and I with mine; it is a sin for a mother to forsake her child," several women exclaimed, grasping their boys by the hand. It was observable that these women were those who had lived in great harmony with their husbands, and when the slaves went forth leading the young boys and carrying the babes in their arms back to Cholula, these mothers returned with their sons, more intent upon being good mothers than good followers of the divine Quetzelcoatl; for the love and duty of a mother is easy to be understood, but the will of the gods is learned only by the few.

The women determined to remain upon the plain of the Cholula for a day or more, that they might learn the real strength of the movement and know who was for and who was against it. They were busy mounting spear-heads and practicing with the band, when a distant, continuous rumble attracted their attention. "It is an earthquake," cried some; "the volcano of Popocatepetl has burnt into flame again," cried others; all were aghast and ready to fly back to Cholula, or anywhere that might afford them a sense of protection. Malinka appeared in the midst of them and with a calm equal voice answered to their fears:

"My sisters, it is neither an earthquake nor the uprising of Popocatepetl that you hear. It is the

great drum of the temple, sounded only in periods of dismay; the great drum covered with human skin which once covered the bones of a thousand victims. Collect yourselves, my sisters. Choose this day whether ye will obey the voice of Quetzelcoatl, or whether ye will return to Cholula to be once more the bond-women of our oppressors, to breed children for the torture, to swell the tide of lasciviousness and sensuality prevailing in Cholula; be the catspaws of men, to be used as they direct, to aid in their triumphs, be a part of their glory, and with judgment, self-ownership or religion, be no better in the world than the slave in the market, or the chattels which men transfer or cast aside at their whim or pleasure. I declare to you in the face of the great God, that my mind is not clear; I see the misery, the cruelty, the horrors of the times, and the voice of my dead husband, and the voice of Quetzelcoatl call to me to go out from the midst of all this disorder, and they promise to reveal to me the better way. Yonder come the men from the city. I retain no one; I council that you obey the voice of our beneficent deity, and go forth to learn his will; but those of you that are content to bear the miseries that mark the lot of women in her present state, return to the despots of Cholula."

Malinka was here interrupted by the rush of the women to the side of the camp upon which approached the men of Cholula, with the beating of drums and cymbals, banners flying, and innumerable pendants as upon some festive occasion. Every man was in holiday trim, his garments sparkling with gems, and chaplets of flowers depending from head and shoulders.

As they approached, the women, at a hint from Malinka, seated themselves upon the ground, and bowed their heads as is the custom of those who observe a vow, but the little girls ran forth to meet them with shouts of delight. The multitude was certainly handsome to the eye, but it is a question whether they gained much by this concession, for it is the nature of men, and women too, to increase their demands at every indication of weakness, and those who would have been content with our thousand dollars at the first, no sooner see a desire to settle, than they increase their demands to ten thousand. It is observable, likewise, that women yield to an obstinate man, who would bite on their tongues sooner than give way to a weak one. Twenty weak women will be glancing out of the

of the eye after one true, brave, domineering man, while a good man, obedient to God and loyal to women, will find them all with noses in the air at her approach.

Here a modern hand had written: "This is it," and profanely added, "The men had better be brained all these she d—ls at once, and waited for a new stock somewhere else."]

The men halted when they had reached speaking distance, and two elders of the city clad in white, and bearing white flags in their hands, came forth from the ranks, and approached the camp; at the same time Malinka, leaning upon the arm of the Lady Tula, clad in the silvery robes of a Priestess, and bearing upon her head the sacred symbol of a dove resting upon the crest of a serpent, went forth to meet them. The envoys questioned closely the reason of this strange hegira of women; to which Malinka replied, as heretofore, that they went forth at the command of Quetzacoatl; adding "it would be impious to disobey the behest of the god. It is thus you and the priests have taught us, and we believe and obey."

"But" returned the envoys, "Quetzacoatl is a gentle god, and careful of his worshippers; never before has he thus called *our women* to leave their homes and desert their children. What are we to do?"

"Should sickness overtake us, who will smooth our pillow and soothe the aching head? Who will comfort our sorrows, and look to our well-being?" The eyes of the speaker were suffused with tears. "Alas!" he continued "without women our world is blank: there will be no prayers to the great god, no court of justice, nothing to fill up our sorrowful lives."

The Lady Tula smiled, and Malinka was about to reply, when several women rose from the ground and walked over to the ranks of the men. It was observed that the latter looked by no means pleased at this movement, and their husbands rather took out of sight at their approach. This was the case with all. Several lovers rushed forward and seized their mistresses by main strength and bore them off in their arms. The latter did not resist in the least. A group of married men attempted the same thing, but with by no means pleasant consequences, and their wives screamed and kicked furiously; some made their escape, others were captured, a few wives smiled sweetly when seized, and were glad to be claimed and carried off. A troop of

young girls scampered off over the plain with the young boys, and were seen no more. There was much noise and contention. The High Priest, also, separated himself from the men, and whispered to Malinka:

"I do not understand you, I distrust you. Explain, or I will bring all the people down upon you."

"There is nothing to explain," said Malinka. "The good Quetzacoatl has directed us to go three days into the wilderness, and there set up an altar for worship, when he will come down and tell us what to do."

The priest looked at her askance, and retired. There was now an appearance as if the camp would be entirely deserted and Malinka, the Lady Tula with a few others be left alone, but the women were many of them thoughtful, and willing to learn the will of God, for they believed in Him, and but for this belief, this faith in the unseen and eternal, nothing would have been done. So it turned out, that while many departed, a multitude was still left.

"Will ye also, go away?" asked Malinka, sorrowfully, but they answered: "Never—we are miserable in Cholula, we will follow the voice of God."

Then the men with the recreant women went on their way. It was even thought the majority of them hurried their departure fearful that more of the women would return. The soldiers jeered and laughed, and cried out, "we can spare the old and the ugly—the fewer of them the better." It was even so; most of the young, the giddy, and the pretty, those that coveted ease and pleasure, and lived upon the flatteries of men, went away.

As the night approached slaves appeared from the city bearing tents of snowy cotton fringed with silver, great quantities of food, and implements of war and the chase, besides gold and gems to a great amount. They brought also a parchment upon which was written by the hand of the High Priest, "Go your ways, all of you; when you return, Hintzilopatchli, the cruel god, will claim you for sacrifice."

Thus were something more than three thousand women banished forever from the City of Cholula; thus went into perpetual exile, thus were thrown upon their own resources of wit and strength, more than three thousand women.

## MARIA ANTOINETTE OF AUSTRIA, QUEEN OF FRANCE.

BY ELIZABETH G. HALSEY.

THE life of my present heroine, Maria Antoinette of Austria, presents many stirring contrasts. She was by birth a princess, and yet died on a scaffold; the daughter, sister, wife, and mother of kings, a crowned queen herself, yet traduced, imprisoned, condemned, and dragged like the vilest criminal to an ignominious death. With truth may it be said of her that she enjoyed the highest honors and endured the greatest sufferings that ever fell to the lot of humanity. Maria Antoinette was born in Vienna, in the year 1755, on the same day which witnessed the destruction of the city of Lisbon by a terrible earthquake, and in after years this was looked upon by the superstitious Frenchmen as an omen of her tragical fate. From her earliest childhood she displayed an intelligent mind, a warm and generous heart, and a courteous dignity of manner well befitting her noble birth. To these rare gifts she added a lovely face and a princely and graceful bearing. She became the idol of the inhabitants of Vienna by her benevolence and liberality to the poor during a severe winter which caused much suffering among the lower classes of the capital. On one occasion she was present when some high dignitary of the court was representing to her mother, the Empress Maria Theresa, the sad condition of the working classes of Vienna, the inclemency of the weather, the enormous cost of fuel and provisions, and the utter impossibility of obtaining employment. While the Empress, much troubled by the recital, was meditating upon the best methods of relief, her little daughter, who had suddenly disappeared, returned, and placing a small box in her mother's hand, said eagerly, her eyes filling with tears as she spoke, "In this box are fifty ducats, mamma, all I own in the world; pray let the money be immediately distributed among those poor suffering families."

Another time, Maria Antoinette was passing through the suite of apartments to the bed-room of the Empress, who was slightly indisposed, when her eye was attracted by some Hungarian soldiers, covered with wounds, waiting to petition their sovereign for a pension, as a reward of their services. Their appearance instantly recalled to the princess that crisis in her mother's life when, with

her infant son in her arms, she entrusted him to the courage and devotion of her Hungarian subjects, who, drawing their swords, swore they held sacred, "to die for their Empress, Maria Theresa." Deeply touched by this remembrance, the Princess approached these time-worn soldiers, inquired kindly what were their necessities, and undertook to present their petition to the Empress. "Mother," said she, as she placed the paper in her hands, "your friends are inquiring about your health, and are anxiously waiting for your answer." "And who are these friends?" asked the Empress, glancing over the papers.

"Some old Hungarian soldiers, dear mother."

"Well done, my daughter; they shall not long to wait."

The petitions were all granted, and the soldiers took leave, invoking many blessings on the person of the young archduchess. Many more instances might be cited of this impulsive benevolent generosity which she afterwards displayed on a larger scale and in a more extended sphere of action, the memory of which, in spite of the calumnies of her enemies, has not yet passed.

The King of France, Louis XV., solicited the hand of Maria Antoinette for his grandson, and having received a favorable answer, the king sent the Count de Noailles to Vienna to marry her by proxy. The marriage ceremony was accordingly celebrated with much pomp and magnificence at Brussels, on the 25th of April, the fair young bride having just completed her twentieth year. She was followed into her new home by the prayers and blessings of her subjects, and that stern mother herself gave a passionate burst of grief as she parted from her favorite child. Little did she dream in her dream of securing the crown of France for her daughter, that she was speeding her on her journey to the scaffold. The Dauphiness, as she was now called, made a triumphal entry into Paris, where she was received with shouts of welcome, and at once captivated all hearts by her beauty, affability, and winning gentleness. She was welcomed with the utmost affection by the royal family, and became the ornament and delight of the French court.

On the 19th of December, 1778, the Princess Maria Theresa Charlotte, since better known as the Duchess of Angouleme, was born, and in the course of the next few years the Queen added two sons and another daughter to the royal house of France. Maria Antoinette was passionately fond of her children and took great pride and delight in the early promise of the young Dauphin, who with his mother's beauty and intelligence inherited also her rare charm of manners. But this gifted child was feeble from his birth, and after seven years of great suffering most patiently borne, with his dying eyes fixed on his mother's face, he closed them forever in this world; and little did his mother think in her agony of grief at the loss of this loved and loving child, that she would ever be thankful that he had not lived to share the fate of his mother. The little Princess Sophia died shortly after, and the Queen grieved for them both as only mothers can grieve. Two children were left to her, both destined to share the sorrows and imprisonment of their parents, and one of them to die a more cruel and lingering death than theirs.

Already clouds had begun to gather over the political horizon of France, and its kind-hearted but vacillating sovereign accelerated by his want of firmness and energy his own downfall. So much has been said and written about the dreadful Revolution which drenched the soil of France with the blood of its best and noblest, that repetition would only weary.

Suffice it for my purpose to say that during the awful scenes of the 20th of June and 10th of August, the heroic courage of the Queen never forsook her. Heedless of her own danger, she thought only of her husband and children, and was ever at the King's side. When overtaken at Varennes and brought back to Paris, she displayed far more firmness than Louis, and when imprisoned in the Temple, she showed herself the most affectionate of wives, the most devoted of mothers. Suppressing all expression of her own grief and anxiety, she endeavored constantly to cheer and encourage her husband, to instruct and amuse her children, thus beguiling the weary hours of imprisonment by the strict performance of her moral and religious duties.

When Louis was dragged from prison to his pretended examination, the Queen for the first time yielded to her tears; but her husband, press-

ing her tenderly to his heart, endeavored to assure her by saying, "Fear not, dearest, I shall meet again to-morrow."

Alas! never again was the unhappy gaze on that beloved face, never again the ill-fated pair to meet on earth. He was torn from the so-called Hall of Justice to the Bastille. On the 6th of August, 1793, the poor Dauphin was torn from his mother's arms, and she herself told to prepare for her removal to the prison of the Conciergerie. In vain the Queen implored permission to follow him. They had to deal with demons, not men. Maria Antoinette was thrown into a dark dungeon, with a pardoned convict for her cell-mate, there to await her final interview. Some few generous hearts were touched by the misfortunes of the Queen, and one or two unsuccessful efforts were made to save her. A public examination took place on the 12th of October, 1793. She was asked if she had not been in a negotiation with the Emperor of Austria prejudicial to the interests of France, to which she replied with gentle dignity, "The Emperor of Austria is my brother, the King of France is my husband; the intercourse with Austria was always for the good of France."

"You were the means of inducing the King to deceive his people," said one of the judges.

"Never," was the Queen's calm reply. "The people have been cruelly deceived, but not by the King nor by myself."

"By whom, then?" was the next question.

"By those whose interest it was to deceive the nation," replied the Queen. "It could be no object either to the King or myself to mislead public opinion."

"Who are they, then, whose interest it was to deceive the people?"

The Queen instantly detected the trap in this question, and answered, "I speak of the facts, not the individuals. Our duty was to enlighten, not to deceive the people."

The Queen's calm and resolute answer tokened innocence, but her judges were not so easily able. When once more an inmate of the Bastille she asked for a needle and thread. All requests were refused to her, but on her persistent request it was granted, on condition that she should use her needle in the presence

jailor. They feared she had some design upon her life, when in truth she only wanted to mend her shoes. The daughter of the Imperial Cæsars was almost barefooted. Her last examination was of thirty-six hours' duration, and all sorts of crimes were ascribed to her, all sorts of questions put to her. Weakened by illness, imprisonment and grief, the Queen still displayed the same calm dignity, the same resolute courage. Only once did she give way. One of her judges dared to accuse her of the most horrible crime of human nature. Her noble and touching answer is on record. With a burst of grief which went home even to the hearts of some of her pitiless judges, she exclaimed, "I appeal to every mother here present whether such a thing can be true."

At the end of the session the Queen's sentence of death was read to her. She listened to it unmoved, and left the hall of audience without uttering a single word. It was long past midnight when she reached her cell, and early the next day she was to die. She wrote the following letter, bathed with her tears, to her sister-in-law, the Princess Elizabeth, commending her orphan children to her care and affection, little dreaming how soon Elizabeth of France would follow her to the scaffold. Surely no mother could read these dying words of the hapless Queen without emotion:

"PRISON OF THE CONCIERGERIE,

Oct. 16th, 1793, 4 o'clock in the morning.

My Dearest Sister: I write to you for the last time. I have just been condemned, not to a shameful death, it is only so to the guilty, but to rejoin your brother. Innocent as I am, and as he was of all the crimes imputed to us, I hope to show the same courage and resignation that he did. I am perfectly calm, as only those can be whose consciences reproach them nothing. My only grief is leaving my dear children. You know that I lived only for them. And you, my kind and loving sister, you who for our sakes have sacrificed everything, in what a position do I leave you! I learned, during my interrogatory, that you and my daughter had been separated. Alas! my poor child; I dare not write to her, they would not let her read my letter; how do I feel sure that these lines will ever be allowed to meet your eyes. Should you be permitted to meet again give them my dying love and blessing. I trust that the time may come when they will

again be under your tender guardianship. Impress upon them what I have always endeavored to teach them, the faithful performance of all their duties towards God and their fellow-men. Teach my daughter, who is so much older than her brother, that she must watch over him and supply as far as she can my place to him. Tell Louis to be obedient and loving to his sister, to do all he can to help her, and bid them both follow our example. How much comfort we have had in our great afflictions from our warm affection for one another, and where can one find truer, purer love than in one's own family! Let my son never forget his father's last words, which I repeat to him in this, my dying hour. Seek not to avenge our death. Vengeance is mine saith the Lord.

I wish now to speak to you, dearest sister, on a subject most painful to my heart. I know what bitter grief my poor little son has caused you, by the odious testimony which he has given against me. Forgive him, dear Elizabeth; remember how very young he is, and how easy it is to make a child say what it does not comprehend. One of these days he will fully realize and appreciate your love and kindness to himself and his sister. And now I have only to say a few last words to you about myself. I die in the Roman Catholic Apostolic faith, in the faith of my ancestors, in which I was brought up, and which I have always professed. I am without the consolations of spiritual aids; I do not even know if any priests are left in the land, and it would be at the risk of his life for any one of them to visit me; I earnestly and sincerely ask God's forgiveness for all my many sins. I trust that in His great mercy He will accept my humble repentance, and take my soul to dwell with Him forever. I also ask pardon of all those whom, in the course of my life I may have injured or offended, and especially of you, my good and devoted sister, if ever, however unintentionally, I have caused you any pain. I forgive all my enemies and persecutors as freely as I hope to be forgiven. I bid farewell to my aunts, my brothers and sisters. I had some warm and devoted friends from whom it is hard to part. Let them at least know that they were not forgotten in my last moments. As I am not a free agent, a priest of the new faith will probably be brought to me. I shall not speak one word to him, but shall treat him as an utter stranger.

And now farewell, best and kindest of sisters. May this letter reach you! Do not forget me; talk to my children about me and their father. I embrace you and my dear ones with all my heart. And now the bitterness of death is past, earthly things are vanishing, I turn to a Merciful Father."

This last sad duty performed, the Queen, exhausted with fatigue and agitation, threw herself on her bed, and for about an hour enjoyed a quiet tranquil slumber soon to be exchanged for that of death. At six o'clock she was roused by the beating of drums, and shortly afterwards a priest of the new government entered her cell. She refused his spiritual aid, but requested him to accompany her to the scaffold. With her hands tied behind her back, her hair blanched to snowy whiteness in the temple, in a common cart used only for the vilest criminals, guarded

by fifteen thousand soldiers, exposed to the gaze and abuse of the same fickle crowd which former days had greeted her appearance with shouts of joy and admiration, the Archduchess Austria, Queen of France, was dragged like the lowest malefactor to the place of execution. But her courage never faltered, though by a refinement of cruelty, the scaffold was erected on the Place Louis Quinze, the scene of the splendid festivities which greeted the fair young bride and the Dauphin when she made her triumphal entrance into Paris. She knelt calmly on the scaffold, saying in clear and distinct tones: "Deign, Lord, forgive my murderers. Farewell, my children; I go to join your father." The priest blessed her as she knelt, and at noon on the 16th October, 1793, Maria Antoinette had ceased to exist.

## THE DAWN AND GROWTH OF CIVILIZATION.

By C. W. R.

It is commonly assumed at the present day that civilization is a plant of slow and gradual growth, which developed itself by degrees in the course of ages, and which belongs consequently to a comparatively late period of the world's history. The "primeval savage" is a familiar idea; and the so-called "science" of the day is never tired of presenting before us the primitive race of man as only little removed from the brutes, devoid of knowledge, devoid of art, devoid of language, a creature in few respects elevated above, and in many sunk below, the anthropoid apes, from whom it is held that he derived his descent by way of evolution. Occasionally, indeed, a confession is made—parenthetically and by the way—that there is no proof of this supposed priority of savagery to any form of civilization; and it is admitted to be questionable which of the two preceded the other. But this confession, hurriedly uttered and hastily slurred over in most cases, makes little impression on the public mind; and the belief is general that in some way or other science has proved that the first men who inhabited the earth were savages, and that there was no civilization till a comparatively recent period.

But the question is one which is really quite an open one; it is one on which natural science is quite incompetent to pronounce a judgment, and

on which historical research has not hitherto decided in either way. Natural science, of course, if it assumes the doctrine of evolution and applies that doctrine to man, must give the precedence to savagery, which is manifestly more congenial to civilization than the anthropoid ape. But if the doctrine of evolution is recognized as a mere hypothesis, one out of many theories as to the mode in which things that are have been brought into the state in which they are, and a theory which lacks altogether any confirmation from fact, then science has to confess that she can give no decision on the point in question, but must leave it to the judgment of those who are familiar with historic facts.

Now, historic facts show that either of two movements is possible. Man can and does often, perhaps most usually, pass from the savage into the civilized condition. We have numerous instances of this transition, which we can follow step by step and put (as it were) under a metaphysical microscope. We see the Greek pass from the simplest semi-savage state described by Homer to the condition of high civilization placed before us by Thucydides and Xenophon. We see the Roman gradually exchange the robber life of the eighth century B.C. for the splendor of the Augustan age or the paler but purer radiance of the Court of the Antonines. In later times, we observe the Arab

hordes, issuing from the desert unkempt and almost naked, with no literature but the confused jumble known as the Koran, no arts but those of forging iron and weaving a coarse cloth; and we trace their progress from this rude condition to the glories of the Baghdad caliphate and the magnificence of Granada. All over Western Europe we see the barbarous races which overran and crushed the Roman empire settling down into a less wild and savage life, adopting the arts as well as the religion of the conquered, and gradually emulating or surpassing the civilization which at their first coming they destroyed. In our own time, and before our eyes, a civilizing process is going on in Russia and in Turkey; serfdom disappears; nomadic tribes become settled; the arts, the habits, even the dress, of neighboring nations, are in course of adoption; and the Muscovite and Turkish hordes are becoming scarcely distinguishable from other Europeans.

But, while this is the more ordinary process, or at any rate the one which most catches the eye when it roves at large over the historic field, there are not wanting indications that the process is occasionally reversed. Herodotus tells us of the Geloni, a Greek people, who, having been expelled from the cities on the northern coast of the Euxine, had retired into the interior, "and there lived in wooden huts, and spoke a language 'half Greek, half Scythian.'" By the time of Mela this people had become completely barbarous, and used the skins of those slain by them in battle as coverings for themselves and their horses. A gradual degradation of the Greco-Bactrian people is apparent in the series of their coins, which is extant, and which has been carefully edited by the late Professor H. H. Wilson and by Major Cunningham. We trace a certain degeneration in the Jews of the post-Babylonian period, if we compare them with their compatriots from the accession of David to the captivity of Zedekiah. The modern Copts are very degraded descendants of the ancient Egyptians, and the Roumans of Wallachia have fallen away very considerably from the level of the Dacian colonists of Trajan. In America, both North and South, the modern descendants of the Spanish conquerors are poor representatives of the Castilian gentlemen who, under Cortez and Pizarro, made themselves masters of the Mexican and Peruvian kingdoms, and introduced into the new world the time-honored civilization of the old.

Civilization, as is evident from these and various other instances, is liable to decay, to wane, to de-

teriorate, to proceed from bad to worse, and in course of time to sink to so low a level that the question occurs, Is it civilization any longer? But still, perhaps, a doubt may be entertained whether the relapse can be complete—whether, that is to say, any people which has once participated in a high civilization can ever under any circumstances be reduced to absolute savagery. In most of the cases that have been quoted, while a certain deterioration has taken place, the end has not been actual savagery or barbarism, but rather a low and degraded form of civilization, retaining traces of something higher, and considerably raised above the condition of the absolute savage. Are there any cases, it may be asked, where the degradation has proceeded beyond this, where a civilized race has lapsed into complete and absolute barbarism?

Now, it is exceedingly difficult—it is almost, if not quite, impossible—to trace such cases. So long as contact with civilization remains, the degeneration will not be extreme. Savagery can only be reached where there is complete separation from civilized mankind; and at the same time such a condition of the physical circumstances as demands the concentration of all mental power on efforts to support life. But in such cases there is of course, no record. The race, tribe, nation, has passed beyond the ken of its civilized neighbors, and has no time to spare for recording its own history. It loses all knowledge of the past, all power of noting events; and if, in aftertimes, it is so bold as to venture an account of its "Origines," the narrative is evolved from the inner consciousness—is pure fancy, and has no claim to be regarded as even built on any historical foundation. Complete and continuous historical evidence, therefore, of such a degeneration as we are now speaking of is not to be looked for; and we must be content to accept as sufficient proof of what is so difficult to be proved evidence of a lower kind. Now, Comparative Philology does present to us cases where there is reason to presume an original participation in a high civilization, though the present condition of the race is almost the lowest conceivable.

An instance of this kind is furnished by the very curious race still existing in Ceylon, and known as the "Weddas." The best comparative philologists pronounce the language of the Weddas to be a debased descendant of the most elaborate and earliest known form of Aryan speech—the Sanskrit; and the Weddas are on this ground believed to be degenerate descendants of the

Sanskritic Aryans who conquered India. The Sanskritic Aryans must, by their language and literature, have been, at the time of their conquest in a fairly advanced stage of civilization. The Weddas are savages of a type than which it is scarcely possible to conceive anything more debased. Their language is limited to some few hundred vocables; they cannot count beyond two or three; they have, of course, no idea of letters; they have domesticated no animal but the dog; they have no arts beyond the power of making bows and arrows, and constructing huts of a very rude kind; they are said to have no idea of God, and scarcely any memory. They with difficulty obtain a subsistence by means of the bow, and are continually dwindling, and threaten to become extinct. In height they rarely exceed five feet, and are thus degenerate both physically and intellectually.

Thus, on the whole, there would seem to be grounds for believing, broadly, that savagery and civilization, the two opposite poles of our social condition, are states between which men oscillate freely, passing from either to the other with almost equal ease, according to the external circumstances wherewith they are surrounded. If the circumstances become ameliorated, if life becomes less of a struggle, if leisure be obtained, civilization (as a general rule) grows up; if these conditions are reversed, if the struggle for existence tends to occupy the whole attention of each man, civilization disappears, the community becomes barbarized, and the savage condition is reached.

What, then, does history say as to the priority of the one state or the other? History, no doubt, shows abundant instances of improvement, of an advance from a comparatively low condition to a higher one, of civilization developing itself out of a savage or a semi-savage state, and gradually progressing, until it arrives at a sort of *quasi*-perfection. But what does the earliest history say as to the earliest condition of mankind? Does it accord with the bulk of those who write the accounts, now so common, of "pre-historic man?" Does it make the "primeval man" a savage, or something very remote from a savage? To us it seems that, so far as the voice of history speaks at all, it is in favor of a primitive race of men, not indeed equipped with all the arts and appliances of our modern civilization, but substantially civilized, possessing language, thought, intelligence, conscious of a Divine Being, quick to form the concep-

tion of tools, and to frame them as it needed them, early developing many of the useful and elegant arts, and only sinking by degrees, and under peculiar circumstances, into the savage condition.

In proof of this we shall allege, first and foremost, that sacred record which is, even humanly speaking, one of the most venerable fragments of antiquity that has come down to us—the opening section of Genesis, chapter I. to V. In this we find our first parents represented much as Milton has drawn them:

"Two of far nobler shape, erect and tall,  
Godlike erect, with naked honor clad  
In naked majesty, seemed lords of all;  
And worthy seemed; for in their looks divine  
The image of their glorious Maker shone,  
Truth, wisdom, sanctitude, severe and pure;  
Severe, but in true filial freedom placed;  
Whence true authority in men."

No savages are this simple pair, but clever, intelligent, quick to invent, able to sew themselves coats on the first perception of the need of them (Gen. 3 : 7), able during their innocence to enjoy high converse with God and with each other, able to suggest to their children the two chief modes of life by which subsistence is readily procured. In simple times, the pastoral and the agricultural. No gradual working onward, with toil and pain, from the life of the hunter to that of the shepherd, and from the life of the shepherd to that of the cultivator, is set before us—the two sons first born to the first man are respectively "a tiller of the ground" and "a keeper of sheep" (Gen. 4 : 2). Again, the primeval race does not find a shelter in hollow trees or in caverns, neither does it burrow under ground, like some tribes of Africans. The eldest son of the first man "built a city" (Gen. 4 : 17)—not, of course, a Nineveh or a Babylon, but still a city—a collection of habitations, permanent and fixed, fitted together by human skill, a sufficient protection against extremes of heat and cold, or against storms and rainy weather. Later, not earlier than this, the tent is invented (Gen. 4 : 20), and then while the first man is still alive, instrumental music comes into being; the harp and flute are framed by skillful hands (Gen. 4 : 21), and the pastoral life is enlivened by the charms of melody. Copper and iron are smelted at the same period (Gen. 4 : 22), and a race of artificers in metal grows up, which produces tools and weapons of war, perhaps also works of artistic beauty.

## THE FAIR PATRIOT OF THE REVOLUTION.

BY DAVID MURDOCH.

CHAPTER XXXII. THE AFRICAN COURT-MARTIAL.  
 Our night walker, uncertain concerning the character of the sounds he heard, dropped himself softly and suddenly to the ground, where he put his ear, hoping to be able to distinguish the voices which gave them forth.

"Some frolickers," said Teunis, "who have made the camp above too quiet. Maybe some fellows on an independent excursion. Both must be avoided by me to-night. I can neither join them, nor be seen by the other? Ha!" said the inner, "these are niggers; what can they be at, and at this time of night? But why need I wonder, they are just like all vermin; they follow a white man, and mock his ways. Why not? They have as good a right to their fun and fight as we have to ours."

Climbing upon a point of a jutting rock, he saw a fire kindled in a hollow place, which he knew must be near to the cloven rock, where he himself often rested, and which was a standing place to all. Many a cup of good Holland had been drunk there by the hunting parties, who were wont to gather round it after their surroundings, at night to make it their pillow before a roaring fire. The Dominie, after one of those fits, which had gone to excess, came down on his sinners in a thundering discourse, in which he rebuked this the *steen des aanstoots*—the stone of stumbling; and by that it was known among his flock, till one day the good man himself came to a party handing the cup around, and finding him coming they obtained one of pure water running through the rock, and gave it to him. He tasted it, drinking it off with a loud smack of his lips, at last saying, "Deszen Mozesst is!" and it is called Moses Rock unto this day.

Cautiously Teunis crept forward till he was near enough to distinguish the shrill tenor of the negro, and the deeper bass of some white men; then a chorus of laughter, which went from the place to the guffaw. Determined to find out who the roysterers were, he sought as close a standing place as he could find, without being seen himself. Climbing well up to the westward, he came down,

almost crawling; as if swimming on his back, feet foremost, to the side of the rock, which he had between him and the assemblage below. Rising up, he looked over and saw such a scene as gipsy life can only present. A large fire burning brightly in the centre, sent out a heat which made the party turn round as brown hams hung on a spit would turn were they possessed of feeling, and waiting for a regular roasting all over, and through to the bone. Here were all colors, from the jet black, glistening with sweat, to the bronze that changed as the fancy was tickled, on to the whity-brown of those called white people.

Teunis knew them all as the slaves belonging to the farmers of the district; chiefly the same ones he had seen in the den two nights ago, attending their superstitious orgies. Cuffee, the African king, as he maintained himself to be; Cæse, with his fiddle; Jerry of Kaatsban; and Tom, the Dominie's man. These were usually the leaders in all mischief around, and though very stringent laws existed in the colonies concerning slaves meeting after nightfall, they were easily eluded by such cunning fellows, who, like thieves, knew more of the laws than the average of justices. Strong in mind naturally, and not degraded yet by long bondage, experience had made them acute in matters where their enjoyments were in danger, or their gratifications curtailed.

To Teunis they now seemed to be engaged holding a court, whether in mockery or in earnest, he had some difficulty to determine. Cuffee was the presiding spirit, as he usually was in all affairs of the kind. His sincere belief, or his assumption, gave him airs which he was not slow to put on, and being of a robust person, and possessed of great shrewdness, he generally enforced the law by physical force.

Tom was the only one who disputed his authority, and this he did, *first*, because the king was a heathen; and *second*, he himself being a Christian, should "*hab authorities*;" and *third*, the Dominie's man affected a little of the Dominie himself. From his place and puffed up pride, he had begun to assume it, and latterly he really believed he had had a call to preach.

At the time Teunis discovered these blacks, Cuffee was acting as judge, trying a young negro, who the secret spectator at once knew; and he soon saw that this was not mere sport, but that Cuffee and his followers, presuming upon their relation to the big Indian, were acting for King George, in due legal form, which, to one who was a mere spectator, might have afforded amusement; but to Teunis, who had now wakened up to the danger of his own playmate, was no joking matter. He determined to watch and prevent mischief.

Tom acted as public prosecutor, and Jerry, the slave of Cornelius Wynkoop, was to defend the accused.

"Constable, cry de court," said the judge with great gravity, when old Caesar stepped forward in front of the raised bench, and mumbled over, "oh yeez, oh yeez," and left the rest in an unknown tongue.

A ludicrous imitation of a white man's trial here followed, which would defy the pen or pencil of genius to portray in its true colors. What was of more importance to our hero, the scenes were indicative to him of how the public mind was beginning to regard his own present position. Leendert, who was the son of Dora, and of the same age with himself, had, like all negroes brought up side by side with a master's son, walked in the steps of Teunis, till it had become his own nature to do whatever his young master did. He was showing signs of disloyalty now, and those of his grade had detected his tendencies. In the trial he was passing through, Teunis saw his own self foreshadowed.

A charge was formally made of leaving the service of King George, and taking part with the "rebels." A jury was chosen, and exact specifications laid down to be proven. In all of which Teunis heard but his own case repeated. The pleadings on both sides were ludicrous indeed, but it seemed that the actors were in earnest.

"Bring in de prisoner guilty of treason," said the mock judge, "and den shoot him."

Teunis was here about to take part, and prevent what appeared to be the actual intention of the cool rascal, whose words seemed as positively spoken as if he were sitting in an Albany court, among his white peers; when suddenly, out of the darkness behind, old Dora emerged, to the great terror of all, including the chief actor himself. Rising, he made a low bow, saying:

"King Cuffee glad to see Queen Dora wid the Gree Gree."

Dora paid no attention to the salaam made to her presence, but turning her eyes into a clear crystal cup she held in her hand, she muttered some words of incantation; then lifting her face to the judge, said in her most solemn style:

"King Gongalloo hang on de gallows dree."

Cuffee had already ordered the prisoner's arms to be unloosed; and then he called out:

"Court 'journed till abter suppa."

"Men, so let it be," said Tom, who was man of all work at home and abroad.

A long pole, laid from two branches, sustained two pots of the biggest size in use, which were simmering over a fire of hot coals, filled to the brim. The acting cook, a full-bodied wench, was looking in now and then, stirring the contents, and scenting the savory steam that entered Teunis's nostrils, making his mouth to water for he had not eaten a warm supper since the night of Tobias Myers's husking-bee. Besides being really hungry, he knew well enough that the purveyors of this feast had found the best in the land. He forgot the robbing of hen-roosts, and nearly in his eagerness for food, yielded up his prudence. It was evidently in the mind of Cuffee that young Massa Teunis had been guilty of double-dealing, and would be punished when caught. With all these willing hands about him, a larger prize than Leendert would be acceptable. There were, besides, some persons present whose backs were toward him, and as yet he had not heard their voices above a common tone.

The festival table was the ground, raised as if a ditch had been dug round a knoll, into which the feet might be stowed away, and the edge of the bank used as seats. Many of them chose the flat places, squatting down on whatever was below them. There were at least fifty or sixty persons of the black population, with at least a dozen young whites—sons of the farmers, whose low tastes led them to seek such frolics, where the animal propensities could be gratified unrestrained. One individual kept himself hidden, notwithstanding that he lay on the ground, just below where Teunis was perched on the branch above. The spy in the tree had his fears that it might be known to the groundling that some one was in the loft.

The supper dishes were large sugar troughs,

in the woods for the spring opening, and clean in the water near by, and content the revellers. Into these the contents were poured—meat and potatoes in the centre stood a monstrous dish of chickens, mixed with sausages. The reed vell wid von anoder," Dido said, been fechten cocks in de mornin'."

The ducks swim in de gravy vell as in de de oder unda dem vings," was the in- of old Cæsar, who gave some extra on his fiddle, as he saw his favorite dish. The attraction of the table were two full of what is known as souse; a well-grown, fat, and corn-fed, cut up into small stewed, altogether, till it became soft. Dido was in her glory when she saw up, slightly browned in the skin and the touch.

A mess for de king, and de Dominie be- it say grace as long as turkey's neck dat n's tail behind."

The hungry men, seldom has a finer repast d. All sat around as they chose. Forks in plenty. A twig cut from the bush m, with a stump for handle, and the ed, was equal to the best silver in the basket of plate. That stuck in at ran- r failed to bring up the game that grati- ater. Bread came out from corners as me Dyce could produce to her New York in her fine stone mansion by the Kaats- and to crown all there was cold slaugh, ough, which was forked into their mouths vere stowing away heaps of manure into ar way.

Ho! ho!" roared out Cuffee, as he fished piece which he saw would be his last at platter, "me got de gobla crop; dat hollo orda!"

He! he!" responded one of the young "King Cuffee got de goose's throat. te good squia."

The faithful Phoebe produced her liquor filled with strong waters of some kind, the usual effect upon human brains. All rollicking commenced, and some of a could not be described without defiling Savage nature came out in its most forms, such as we read of in histories of its feasts. Looking down upon them,

Teunis saw the rolling and tumbling as if it had been the wriggling of black snakes, in a round pit.

During the noise, our night-walker had climbed to the outmost part of the branch. He was eager upon finding out who was lying beneath him on the ground, and had just succeeded to his horror, when Cuffee cried out:

"Now for the trile of de Ingen Shandaagan, for falling in'd love wid Martin's Elshie—Clerk will read de law."

Here Tom, who had heard it many times, gravely repeated the colonial statute: "De durd Sessions of de fif Assembly Queen Anne. Be it 'nacted by de Gubernor, Council, and Assembly, in case any slave or Ingen, kiss, or marry, or court free man's daughter"——

Here the Indian, who took all this more in earnest than was intended, and who had worked himself up, under the influence of love, liquor, and mortification, rose just under the nose of Teunis, and gave the war-whoop of his tribe, so lustily and so long, with his face turned toward the mountain, that the echoes of his voice returned as if a thousand demons had responded to him. Every man, white and black, started to his feet and fled as if the Mohawks had come into their midst with gleaming tomahawks. Nor was the commotion abated by Teunis, who, eager to see the whole from his perch, had gone so far forward on the branch that it swung, so that he lost his balance and dropped right among them, fronting the infuriated Indian, who became cool in a moment, when he saw the very man he cared less to see than any other, before him, as if demanding satisfaction for the injury with which he had just been charged.

"Ugh," said the red man, as a grim smile crossed his face, "the young bear can climb trees for sweet apples."

"And sometimes he gets sour apples for his pains," was the tart answer of the excited Teunis. The fact alluded to in the mock charge of this black court, was evidently understood by those eavesdroppers at home and abroad. He had suspected all along that the intention of Kiskataam was to remove the young English lady to the West, and the reward of Shandaagan was to be his own beloved. Putting all he knew in one, he was persuaded within himself, that the hiding-place of the young woman was known to these wily men. But there was no time to settle that question to-night, so turning away from his enemy, he stepped up to

the souse dish, and putting a fresh fork into the mess, he proceeded to eat a hearty supper from the abundant fragments which remained. By the time he was through, the leading spirits of the late scene had disappeared, afraid of being informed upon. They knew the law well, and Tom in his mock fun had reminded them that

"It sail no' be lawful for more as tree niggers to meet together in von place, 'cept at kirke door on Sunday, upon de penalty of being whipt upon de naked back, wid forta lashes by de public whipper, Yankee Dorlan, the horse-doctor."

The fear of this was constantly before the eyes of the slaves, and even Cuffee did not care to be seen by a man of Teunis's character. Tom, however, came back, assuming to be loyal, and willing to excuse himself for being present with a crew of black rebels.

"The Dominie would look wild to see you here, Tom," said Teunis.

"And vilder to see us two," said Tom, as he winked a sly wink. "Ve vatched dem;" putting weight on the plural word *we*.

#### CHAPTER XXXIII. REVENGE IS SWEET.

TEUNIS and Tom made their way to the camp, where Grant kept guard. Among the first questions asked of the brawny Scotchman was, "where's the Dominie?"

"He's gane doun the glen to that warlock bodie. They are baith ow're weel acquaint with the diel. He is, nae doot, sitten atween them."

"Has he been long away?" was the next question put.

"Oh, yes; but when twa sic meet, nae sayin' when they will part: but for mysel', I would as sune hae a crack with auld Sawney as we' ane 'o his bairns."

"Oh!" said a new comer, whom Teunis had not seen in the party that day, "you are mistaken, Grant; the hermit is not one of your Scotch witches, but a respectable spook as can be found in a Christian land, where it takes all kinds of people to make the right kind of a world."

"May be, sir," said the Scotchman, who turned to Teunis and asked with evident feeling, "where did you leave that fine Englisher, Clarence? has he heard any thing o' his sister? his heart was sae in his mouth when he spoke about her that I began to suspect she might be a bit tenderer than a sister. There is nae accounting for such things. Bluid is *aye thicker than water*."

"I am going down the hill, Mr. Grant," said Teunis; "and I would hint to you that there are Indians about, who have ears that hear a great way off; and their noses can smell tobacco smoke a mile away; and you can see the fires of Brandy's party are not much beyond that distance."

"You are quite richt, sir, and I maun awa roun' all the outposts and see after things. I have heard my father, honest man, say, that when he was out in the forty-five, that he smelt King George's poother frae Loch Awe to Fort George. Good night with you; I'll see you in the mornin', and we'll hae a crack aboot these things."

"A beautiful night it is, Grant; but it may be an awful morning," said Teunis, his mind running in a mournful direction.

"Yes, man, that is a bonny sky. It is grand to stand up here and view that crown in the heavens. It sends me awa back again, where I herded sheep on the braes of Balquidder; when I used to watch these very stars, as they gaed round like clock-work, tellen me the time o' night. Man, how happy I been sometimes rolled in my plaid; and thinkin' whiles on the great Creator, and wiles on Susy McLaren. Poor thing, she was ta'en awa fra me, far aboon those stars; and I am here this very night, on ither kind o' hills, herden Indians; kittle kind of sheep, and no' lamb among them, if we leave out that puir lad's sister."

"Yes," said Teunis, touched with this fit of tenderness on the side of Grant; "there is another besides her that I am interested in; and she is not my sister."

"Aye, man, I suspected as much as that; I'm an aulder man than you, but my heart is no altogether so cauld but I can feel for you. when I think on Susy McLaren. There's my han'. Teunis, and depend on't, if Hughie Grant can help you or yours out o' trouble, he'll do it wi' right gude pleasure. Noo, awa wi' you to the glen."

Teunis left, nor was he long in reaching the foot of the hill, which he had travelled frequently; and he went now with more confidence because of his appointment with the mysterious being: still, putting his hand in his bosom, he pulled out a black pebble stone; touching the spring, so that he might be ready should danger come in his way. In spite of his convictions, his feelings dwelt on the superstitious at the time; and as he drew nearer to the door, the quicker his heart beat in his breast.

"I would not consult this witch of a creature."

ere the Dominie not near me," he said to himself. "I must however, wait till the two part on each other."

He came up to the door of the shanty and saw the flickering light between the crevices of the logs, that had been laid up of old by some trader or trader, who had built them for shelter while he gathered his peltries from the Indians during a winter's hunting and trading campaign. It served now another purpose, and long had had the reputation of being the Geest Housen. Teunis, knowing that a window was open at the rear, stepped cautiously round, that he might first ascertain the state of things within. Putting his ear to the opening, which was covered by the skin of some animal, he heard voices in earnest conversation. There was a small slit which allowed him to see or hear, but not at the same moment of time. His first effort at seeing was to obtain a perfect look of the cabin; so, fixing his eye on the crevice, which had been newly supplied with pine knots and cones, he watched till the blaze broke through, when he saw three sides of the den. Two of these were covered with skins of different kinds of animals, inhabitants of the region; some of them undressed; but the most of them tanned after the Indian manner of preparing furs. These served as clothing for the person of the inhabitant out of doors, and for the bed of the restless solitary at night. Guns and pistols of different patterns, with other hunting apparatus, were suspended on deer's antlers, which were the hooks for all things that were hung up. Above the place where the couch was made, a naked sword gleamed as if alive when new fuel sent forth flame. The scabbard depended on another hook hard by, and was ornamented with some precious metal. Besides those necessary articles of furniture, there were things of which the observer could not see the use so easily. A large paper globe was suspended from the roof, covered with figures of beasts and birds, serpents and men. On the wall on the left side were pictures, which, so far as Teunis could distinguish, were more of demoniacal than of human shape.

These observations were made at a glance, for the mind of the slow Dutchman was now excited to the highest pitch, and comprehended in a minute what an hour could not have unfolded to him at another time. As we may suppose, it was the living human figures which chiefly arrested his

attention. There were two men, one on each side of the fire. The Dominie he knew, and only observed that he was in his most dignified posture; if possible, more so than when he sat in the President's chair in the Consistory. He had never seen him before with a face in which intelligence and goodness struggled so much for the ascendancy. His usual humor lay hidden away in the deep lines that surrounded his eyes and his mouth; and yet while he sat gravely, like a man who was conscious of his place and power, he yielded a deference to the man before him which Teunis had never hitherto seen him do. But this was the first superior he had ever seen in the presence of the greatest man on the Kaatskills. The other man was of tall and upright carriage, with a head like one that was accustomed to command. His face closely shaven, and neck bare, he seemed more like one sitting in a city mansion, than the rough unshaven creature that interrupted him on his way two days ago. The obeisance given him by the Dominie—who called no man master—showed him to be of some distinction. Perhaps a messenger from the Provincial authorities, proffering help; or, after all, he might indeed be a real wizard able to change his appearance like Satan himself.

At that instant a change from one position to another gave Teunis a chance of seeing him more closely, when he almost called out, "That is none else than Captain Whittesley, that caused so much commotion in Sopus the other day." Teunis had read in the Arabian Nights' Entertainments of persons going through such transformations, but he had ever believed it to be but a fable; and he almost trembled when he remembered how Granny Hoffman had said, with her long skinny finger lifted up, "Teunie, Teunie, never looken on ole duivel wid hisn young face."

It was while Teunis was conning over this warning, that the object of his scrutiny turned his eyes in the direction of the place where he was standing, so intently that the hidden spectator's blood ran chill. Rising from his seat by the fire, he took down his pistols, and coming directly to the window where Teunis stood, he thrust his hand so quickly that the looker in had just time to squat on the ground, and let the inmate fire over his head, one pistol after another, followed by a similar discharge of guns, that seemed as if the cloves and the gulf were sending back their

reverberations, which increased in loudness as the several pieces were fired off. The state of Teunis's nervous system made him believe that the artillery he heard must be something more than earthly; and had he been threatened with a muzzle at his ear, he would have sunk dead on the ground, so feeble were his knees when he attempted to rise. Recovering from his fear, he heard the voices again within, and ventured to look once more. This time the skin was left a little aside, so that he could hear and see at the same time. The stranger was reloading the pieces, bestowing great care upon the manner as well as upon the matter in hand.

"You are very precise and attentive to these Boanerges. Do you suppose that they will speak their thunder any louder, or with more effect?" said the Dominie, who was evidently asking not for information, for he knew as well as others, but because he was leading a conversation.

"Reverendissimo Domino, know you not that a little more or a little less powder would either fail to carry, or scatter the shot without doing the execution; I am confident that Leyden taught you that loud thunder is not lightning."

"True sir, but I find that thunder frightens more people than the lightning; and when you have more powder in the flask than shot in the pouch, what is to be done but let fly, and you may chance to hit."

"Thrown away, Reverendissimo Domino, know this, that a little more or a little less would fail, as I said; so look here, this thimbleful is worth more than a hornful. Your piece may chance to kick you over in the—I beg pardon—pulpit. I give you this illustration from Leyden."

"You would say," said the reverend expounder, "that short sermons, short prayers, spoken cool and quiet, to saint and sinner are best. But tell me if you ever in the heat of battle thought on the thimbleful. Nature is then above all rules."

"Reverendissimo Domino, nature in war, work or worship, is but wisdom, requiring the true expression, whether it is to be given by Captain or Doctor Theologi. Be in earnest. The heart, your reverence; the heart in the right place, and then fire away wisely."

"Old Cromwell's advice, 'trust in Providence, and keep your powder dry.' Just as I said, honorable captain, nature is above all rules; and a few grains of powder more or less is not thought of. *Thimbleful* in the heat of battle, sounds like folly.

"Ah! but Reverendissimo Domino, we measure the powder before the battle begins," were the deliberate words of the man loading the piece; who as deliberately took out a few grains from the thimbleful.

"As we soldiers of King Immanuel should do," was the quiet reply of the reverend man, "I accept the good advice. I have seen many good sermons lost by scattering the points; just as I did myself in a flock of pigeons when my piece was overloaded. To drop figure, I see that you are in earnest there, preparing for battle. If so, please to inform me, captain."

"Remember," was the quick reply of the other, "that you are not at liberty to use that title here nor elsewhere above your breath. After to-morrow I hope to throw aside all disguise, but I must first have revenge. The face of a dying mortal follows me everywhere, crying revenge! For that have I yielded up king, country and ranks. Thanks to the Almighty, he has heard my prayer, and brought my enemy close to me. Now hear O God, again, and let him not elude my hand—the hand of justice—a second time, as he did once before."

These last words were uttered with exceeding bitterness and while the loading went on. There was a deep determination expressed as the wadding was rammed in, that seemed to say: "Now let it belch forth fire and blood." There was a pause in the conversation here as if the operator was afraid to trust his feelings in words, and the Dominie was too prudent to attempt making way for the torrent that he saw lay behind. When he spoke, it was cautiously; but venturing, he said:

"Revenge, my dear sir, is a fiery demon; and I have marvelled if that be not the reason why he deals so much in powder and ball."

"Reverendissimo Domino, there you are wrong again. A pistol is a gentleman, and a musket is a hero. If they fall into malicious hands the fault is with the demon that uses them. It is the stiletto and the poison bowl that act the coward. That pistol in my hand is the executioner of justice; and all I want is to have such a good judge as yourself to see that justice is done without malice. It shall be dealt out as the Almighty apportioned it to the sinner, when he sends down his thunderbolts: God's firearms have no malice in their execution."

"Noble sir, hear what that God says 'vengeance is mine.' It is too sweet a morsel, the heat in

a mortal man. The sinner should be according to his sin; but we must wait a while."

Reverendissimo ministro verbi Dei. "He that man's blood by man shall his blood be wait God's time! O Heaven! have I waited thy time, and thanks to thy great name, now come. You will say this yourself, Reverendissimo Domino, when I have rehearsed you of wrongs in your ear, and my vows." "Honorable sir, you have hinted these wrongs before, and I am anxious to be able to avenge your honor when you are gone, for that you must go."

"My duty is performed, and that will be your reward fulfilled. But mark, Reverendissimo Domino, how that Providence, in which you now dwell, and which I am now forced to believe in, has brought the sinner to the place of his end."

"Have I not heard something of a decoy vessel to bring on here him that you call your betrayer? If so, then more than Providence has a hand in the matter."

"And that has been revealed too; some of those of the greatest number, are sieves, through which the red race have as much as their neighbors. But tell me, honorable sir, if Providence does not use all sorts of stratagems?"

"And he also controls them, when he sees they would go too far; I have seen a fool set on fire, and he could not stop it; and I once opened the sluice out of sport, when the water broke through with a force that swept him away. It is a dangerous thing, this helping the wicked."

"Having a good course yet; to-morrow I will leave the whole well, and you will say so."

"I grant that it may; but unless the man who pulls the strings of the puppet-show, understands the machine well, he may bring up the curtain at the wrong time and spoil the play. A wiser one than he must direct."

"Reverendissimo Domino, be patient and you will see special Providence here, as you would say. Did you know all that your God has put in my hand, and you would yourself urge me on to do my duty at the right time and place. I will wait for justice! Woe be to me if I fulfill not my duty. I see the sword at this moment; I

have seen it every night for the last year, as I lay on that skin, suspended over his head: and hear me, by the God of justice, I will have revenge."

"Perhaps you will succeed," the Dominie here interposed, "but does it accord with our notions of right and propriety that the injured should become both judge and executioner?"

This argument, which went farther than the roused reasoner wished, goaded him, so that he almost screamed out in madness: "No man may come between me and my victim. I am appointed of heaven. I have prayed, planned, dreamed of this hour, and tracked him like a sleuth hound; how I have lain on that bed thinking of nothing else, till I fell asleep, and the morning found me dreaming that I had him by the throat. I have bought the service of menials and flattered the vanity of fools; made myself appear to the vulgar a simpleton, a wizard, everything, that I might see this day, and now to let him go into the hands of those who will deal daintily with him, calling it justice, lawful justice. Ha! ha! ha!"

Here the speaker rose from his seat like a maniac, smiting his hands on his forehead, and laughing again, till the echoes out of doors mocked the hoarse sounds within.

During a pause in this transport, the Dominie put in a few words, saying: "Then you have not a high opinion of Sir Henry's sense of justice."

"Why should I have a high notion of his honor? This man was my bosom friend; I took him into the sanctuary of my heart and of my home. He betrayed me; defiled her soul, which was as pure as the driven snow which I have seen coming into my hut here. Yet she died in my arms, praying to me for my forgiveness. Freely did I pardon her; but I swore on my knees, with her still warm hand in mine, and her eyelids unclosed, that the villain who had caused this should have the full punishment. That oath is recorded in heaven, and was carried thither by her whom the villain had ruined. But where is the law on man's statute book to punish the guilty seducer? Can any tribunal restore to me my pure Augusta, or give me back my peace of mind; my home; my joyous heart! Where is the equivalent on earth! Men taunted me by pointing me to the code of honor. Honor with Satan! honor with the man who had already violated all honor! But still I offered him the justice of a soldier and of a gentleman. He sneered at me. When I appealed

to that same Sir Henry, he affected to feel for me, but he had his favorite removed, where I could not find him. He promoted him instead of disgracing him, and then I swore that they all should know and feel my justice."

"And yet you know that mercy is the darling attribute of God," was the quiet insinuation of the good man present, anxious to allay the passion of the agitated solitary, who was hiding his face a minute, till waking up he said:

"I know all that, and it is well for the Almighty, who can allow himself to wait, since time is nothing to him; he has eternity to operate in, but we mortals must be quick when the time comes."

"And yet," said the reverend visitor, "you have been very patient in your purpose, and have taken a long time."

"Yes," and this was said with a deep sigh, as if it involved a confession of guilt. I left my own colors, burning with revenge, threw myself into the ranks of you rebels, whose cause was nothing to me, as compared with my own; the authority of Washington, which you saw to-day, I purchased by pertinacity of purpose. I left the world, came here, when I found that this hut lay near to the road which leads to the West. I bought the service of Kiskataam, who has decoyed the villain hither. I bought the same Kiskataam that he might carry off another, that shall be nameless. The black, the white, you all are now helping to develop my plot."

"And is this the secret," said the astonished pastor, "of the Hermit's residence in this wild region? his walks by night, and of his journeyings and disguises by day? For this he has made up with the Jew and Christian, the deist, and the Pagan. His mixing with witches and saints; his influence over the old men, and the young maidens; all, that he may be revenged on one that has injured him? Verily I shall be humbled after this, when I think of the zeal of revenge—revenge on one man."

"On two men, holy parson: the one who did the injury, and the one who sheltered the sinner. Both shall see what you Calvinists call a special Providence. God has aided me in my pursuit. What say you?"

"I could believe all you say," said the calm auditor, smiling, "were it an unbiased interpreter that preached it; but our wishes make us partial commentators, and hence law has been established

as the moderator between the offender and offended."

"As the colonies should wait for the king's law and not have recourse to arms," was the quiet retort of the recluse.

"Most honorable captain, the people waited the law was lost sight of in despotic tyranny; we fell back upon our natural rights."

"You help me, reverend sir; I waited till I was thrown into my hand, and I have now fallen back on my rights as a man, and it is not possible for you to overlook the advantage that is thrown into my hand."

"I own," said the Dominic, "you make our good case for yourself, and on that very account I am the more suspicious of the end in view. We are apt to be well pleased with our own creations, and call them the work of God when it suits us."

"But Reverendissimo Domino, hear. There are on the flat rock above us a band of marauders, and they have in their hands some of your own friends. They are waiting for others. That noble-hearted girl, Elsie, is one of them, and the daughter of Clinton is the other. You heard the story to-day; now tell me, did I bring that young lady here? Have I detained Brandt so long that the brother has had time to come and help in the rescue? If this will teach Clinton that he ought to have done justice to me, that the hand of God has followed him, and found him in his own family, so that the very man who injured my honor is the destroyer of his own peace, shall not the punishment of the double-dyed villain lead to the deliverance of your friends, to the restoration of the innocent girls, and to the fulfillment of my vow, and be a warning to the guilty ever afterward?"

"Amen," was the hearty response of the vanquished Dominic, whose feelings were all the time on the side of the speaker. Pipes and tobacco were now produced, where amidst the thick fumes of smoke the theologian was eager to resume the argument on special Providence in the abstract. His antagonist fought shy, not from any inability, as was evident, but he was now too much in earnest to attend to a mere display of intellectual gladiatorialship.

"I am pleased, sir, to see that our discussions held before, have had some effect upon your belief, and that those vile Arminian doctrines are abandoned."

"Venerable sir," was the half jocular reply of

the other, "I am too young a convert to be congratulated on my conversion. You have just now warned me against allowing my wishes to control my faith."

"Yes, honorable captain, but you have too much philosophy and legal acumen not to perceive the force of that canon of the national Synod of the Reformed Church, held at Dordrecht, not"—

"Oh, yes, reverend sir, that was a great convention; I have it now before my mind. You lent me the book, and I have profited by it; but you will not refuse a cup of this good liquor, for dry argument ought to have the throat well moistened, else we are apt to stick too long at the hard points."

During these passes of intellectual debate, the stranger had put his hand into his capacious coat pocket, and produced a square bottle, which he took kindly before he poured out part of its contents into a wooden cup; holding it out to the Dominie, as he made those remarks, in a quiet, pleasant manner. The minister, without stopping his discourse, took the offered beverage, and with his pipe reeking in his left hand, he lifted the cup half way to his mouth, looking in the face of his entertainer, continuing to say:

"That canon as I have said to you before"—

"Yes, sir, drink;" interrupted the other. "I know it all by heart, I have been, as you shall hear, a most diligent catechumen. 'As God himself is most wise, unchangeable, omniscient, and omnipotent, so the election made by him can neither be interrupted nor changed, recalled nor annulled; neither can the elect be cast away, nor their number diminished.' That is the article. What think you of the liquor?"

"Honorable sir, that came out of Elder Abiel's cellar. I was there on the night he returned from Jamaica. I took home a barrel of the same kind; which, somehow, has run dry very quick. I have always blamed that scoundrel Tom. But, concerning that canon—correctly repeated, verbatim; and what is better, you have expressed your belief in it."

"Reverendissimo Domino, your good health, and success to our enterprise. Your amen lingers in my ear yet, like rich music. But do you not think that the authority of that Synod of Dort is greatly impaired in its force by the strong minority in favor of Arminius?"

Vol. IX.—9

"There was a majority on the right side," said the Dominie, warmly, as he emptied the second cup, "and there was Calvin, a host in himself."

"So, reverend sir, you test truth by numbers, and the quality of the man that heads them. Where would it lie now with you on one side, and your humble servant on the other?"

"Solomon declares that in a multitude of counsellors there is safety."

"Then, Reverendissimo Domino, the heathen and the papists are safe."

"Honorable sir, you know that the staff of an army is the smallest part, yet they fight the battle."

"Just as King George wanted to rule by his staff, and the many would not allow it."

The Dominie was getting warm inside and out; when his teaser said to him, "here is a subject that concerns us more just now than the Heidelberg catechism."

A large skin was spread on the wall, the fur inside. The unknown captain began to chalk out a plan upon the surface, explaining as he went along the combinations necessary for future operations. These were too intricate for Teunis to comprehend. What he could gather was enough to convince him that the Dominie and the hermit did not agree.

"Your plan, noble captain, is all made with one overwhelming thought in your mind—the punishment of your personal enemy; we cannot sacrifice the good of the whole for that single point, however intensely you may feel concerning your end. Your scheme has too much of theatrical trick and plot about it to prove in all points successful. You are desirous that your enemy be made to bite the dust in the eyes of an audience whose very presence shall humble him. We have public good in view, even though your intended victim should escape the fate he justly deserves at your hands."

The Dominie's auditor was calmed by a thrust which had so much reason in it, but persisted in saying that the arrangement of the several parties was complete, that it could not possibly fail of both humbling the guilty and effecting the public good.

"You may be disappointed in what you expect. Let me say what I think. You have woven your net with such exceeding great skill that I am now afraid that the boldness of the Mohawk and the desperate villainy of the English colonel will break

it; when you may find that the wise have been caught in their own craftiness. You have heard our plan of attack, noble captain, and if you can take part in either division we can make room for you."

At this point in the discussion, the captain, as he was called, stepped forward and wrote with his chalk some figures Teunis could not at his distance decipher, but which made the Dominie start, and then give a glance around. This brought the conversation gradually to a close, as if intended to deceive some one within earshot.

"When do you expect the hermit home?" was the casual question of the Dominie. "He keeps late hours in these regions."

"All hours, reverend sir, are alike to him; and as he would not relish more company than suits him, we had better march up hill to the camp."

This Teunis only regarded as a ruse, for he saw the glance and the look which was cast at the widow, and that he might not be caught eavesdropping, he slipped back into the darkness for a few minutes, intending to call at the door as soon as prudence would permit.

## WOODED AND MARRIED.

### CHAPTER XXXIII. DARKEST BEFORE DAWN.

EVERY one thought that Miss Elliott looked strangely ill that night.

The Fortescues and Trevors and Humphrey Nethcote were dining up at the Great House that evening, and Dym, who had spent the afternoon in her own room in a confused trance of suffering, had been obliged to rouse herself at last, and, after bathing her aching eyes and head, to creep down stairs, trusting that under the shade of the friendly twilight she would be able to steal to her usual corner beside Mrs. Chichester without challenging special observation. But on this occasion the Fates were against her.

The lamps were already lighted as she entered the drawing-room. Humphrey had possession of her corner, and the squire, contrary to his usual custom before dinner, was lounging on the rug in his favorite attitude, carrying on a somewhat one-sided conversation with his cousin.

Beatrix was not quite so ready as usual with her answer; she appeared absent and ill at ease. She started almost nervously as Dym entered; a quick flush passed over her face. Guy did not seem to notice it: he talked on indolently till Humphrey's shocked voice reduced him to momentary silence.

"Why, Dym, what ever have you done with yourself? Some one told me you were ill," he began, in his cheery good-natured way.

"I have had a bad headache," stammered Dym,

taking refuge in a seat beside Mrs. Chichester, and wishing in a sort of agony that Humphrey would desist from his questions; she commanded her voice with difficulty, so as not to alarm Mrs. Chichester, who was always anxious when anything ailed her favorite.

"You must have a shocking headache, my dear, for your hands are like ice, and your face was quite burning when you kissed me just now."

"The fire is so hot," returned Dym, struggling for composure, and shielding her face with her hand. "Humphrey, would you mind handing me that screen? Thank you. I am only a little faint. I shall be able to talk presently." And she gave him such an appealing glance to be silent, that Humphrey, sore perplexed as he was, could not fail to comprehend her, and at last consented to leave her in peace.

Dym drew a long breath of relief as he left her. Her screen shielded her from observation. Mr. Chichester was still talking: he had not noticed her, then; if she could only elude his penetrating eyes, all would be well; she must get through this evening; by and by there would be time to think and to form her plans.

"Do you think you think you need come in to dinner, Miss Elliott?" Dym started, and the screen fell from her hand. Mr. Chichester quietly restored it. He had come noiselessly round to her side, and was leaning on his mother's chair,

but his question was so low-toned that it only reached the ear for which it was intended.

"Thank you; I have only a bad headache; it will go off presently," faltered poor Dym. She did not dare lift her eyelids, but the grave comprehending tenderness of Mr. Chichester's voice brought the color to her face.

"Is there any necessity to put such a force on yourself?" he persisted, gently. "You are either very ill or very unhappy. I wish"—in a half-w whimsical, half-serious tone—"I wish I knew what was troubling my little friend."

"Don't Mr. Chichester. Oh, if you would only leave me!" gasped out the poor child. She really hardly knew what she was saying: her temples throbbed with nervous agony, a dull sickening pain was at her heart, she felt physically faint and ill. "If only he would not be kind to me," she said to herself. "If I could only go away somewhere out of the reach of his voice." She had a dull sort of consciousness that she had been taken at her word, that Mr. Chichester was gone and his place was taken by Humphrey.

"You are not to come down to dinner: the squire forbids it," he whispered loudly. "Perhaps the quiet may do your head more good. I heard him order Stewart to bring you some strong coffee. Try and rest a little, and perhaps in an hour you may be better." Dym gave a feeble smile in answer. When the room was empty, she took possession of one of the couches and drank her coffee. How good of him to interpose and shield her in this way! how could she have sat through the long dinner between Mrs. Trevor and Humphrey, and opposite Beatrix's scrutinizing eyes? "Perhaps he only thinks I am ill, and will forgive my petulance; but how could I tell him to go away when he was so kind—so very kind?"

Dym was able to pronounce herself somewhat better when the ladies made their appearance in the drawing-room. She shrank away from Mrs. Delaire's advances, however, and placed herself under Mrs. Trevor's wing.

Mr. Chichester found them talking, to all appearance very comfortably.

"Has my prescription taken effect?" he said, standing opposite them, and giving Dym one of his most critical glances. Dym felt his tone was a little cool.

"My head is certainly less troublesome," she returned, evasively. "The coffee was much better than the dinner, Mr. Chichester."

"Humph!" was his sole answer, turning on his heel, and for the rest of the evening he did not again approach her corner.

Dym slipped away as soon as the guests had gone. She made some hasty excuse that Mrs. Chichester wanted her, and did not again reënter the drawing-room, where Guy and his cousin were the only occupants.

Florence was awake, for a wonder. Dym lay down on the bed beside her, in her white dress, and took the little creature in her arms, and waited patiently till she had fallen asleep with her head on her shoulder. "She would not hold her often in this way," she thought; and all at once it came into her mind how sadly Flossie would miss her. "She loves her father dearly, but she has not given him all her heart," she said to herself. And involuntarily she pressed the sleeping child closer to her breast as the prospect of their speedy separation came upon her. Dym never knew how the long hours of that night passed away; she could hear the church clock chiming out the quarters one by one. Presently the cock crowed, and a faint dusky light came stealing up the valley. Her eyeballs burned, the dull heavy throbbing at her head went on ceaselessly; towards morning fatigue and pain overpowered her, and she slept. Phyllis found her later on still in her white dress, with Florence nestled close beside her.

"Why, you have never been to bed at all, miss!" gasped out Phyllis, open-eyed and anxious; "dear heart, you will take cold and be sick, and no wonder, neither."

"Hush, Phyllis! I fell asleep without undressing; that was all; it was very wrong. Please say nothing of this to Dorothy." Dym felt she had been incautious when she saw Phyllis's puzzled look of alarm. She dressed quickly, and was in her accustomed place at the breakfast-table long before Mrs. Delaire made her appearance. Guy and his child came in later hand-in-hand.

"I hope you are better this morning, Miss Elliott," Beatrix had said to her. Mr. Chichester merely gave her a scrutinizing glance as he shook hands.

"What are you going to do with yourself this morning, Trichy?" he observed, as he sat down.

"I thought, perhaps, as it is so fine, we might ride over to Knaresborough," she returned; "it is too far for Florence, but you and I might go."

He shook his head.

"You must leave me out, if you please. I have business this morning."

"Not those tiresome farm-accounts, Guy? they could wait, surely; and these April mornings are so delicious." There was a trace of impatience in Beatrix's tone.

"I will send down a note to Latimer; it is a pity you should be disappointed of your ride," returned her cousin, quietly. "My business is almost as unfortunate as your fit of the vapors yesterday, eh, Trichy?" And there was a lurking tone in Guy's voice that made Beatrix color with vexation. Do what she would, she could not make this man yield to one of her caprices: he would set aside her requests in the coolest way, if they did not meet with his approval.

She rose from the table now with a displeased air.

"Do not trouble yourself to send a note to the vicarage. You know I dislike Mr. Fortescue's company; if you will not ride with me yourself, Guy, I do not wish for any other escort."

"To-morrow, then," he returned good-humorously. "Suppose you keep my mother company this morning." And Beatrix, vexed as she was, did not dare to press the matter closely.

Dym had left the room, and was hurrying across the hall, when she heard Mr. Chichester's step behind her.

"Miss Elliott, have you any very pressing duty summoning you at the present moment?"

"I was going up to Mrs. Chichester: she expects—that is—I always read to her in the morning."

"Headache or no headache, I suppose? I have sent my cousin Beatrix to sit with her. Come in here a moment, please: I want to speak to you." And Mr. Chichester opened the library door. But Dym, for the first time in her life, hesitated to obey.

"I must go; I am sure your mother wants me," she persisted, keeping her ground. But her color varied dangerously.

Mr. Chichester gave her one of his peremptory looks.

"Do you wish me to remind you that I have a right to be obeyed," he said, so gravely that Dym did not venture on a second remonstrance. Mr. Chichester's slight austerity vanished as he placed a chair for her.

"You are so unlike yourself that you make me

unlike myself," he said, with a smile that was evidently meant to atone for his speech. "Come, Miss Elliott, drop this reserve that so ill becomes you, and tell me frankly what ailed you last night."

The question was so sudden and so unexpected that Dym lost her presence of mind. "Don't ask me. Oh, I am so unhappy!" she said, hiding her face in her hands.

"So I suspected," was the quiet answer. "You are not subject to fits of vapors too, are you? Come," and the shielding hands were taken down and held for a moment, "don't treat me to women's most persuasive arguments—you know what a horror men have of tears, but tell me—I have a right to know—what has been troubling you."

His voice, with its old kind drollery, touched on too painful a chord. Dym snatched her hands away, and for a little while answer was impossible. Only between the slender girlish fingers the hot tears fell fast—tears of sorrow and shame, of doubt and bitter yearning.

Mr. Chichester stood looking at her for a moment, and there was a shade on his face as he turned away and walked slowly up and down the room. Evidently there was something here for which he was not prepared. He had had one glimpse of her face before she had hidden it from his view, and its wild look of sorrow almost appalled him.

Dym hoped he would leave her; but he was only giving her time to recover herself. Presently, when she had grown a little calmer, he took the seat beside her.

"Miss Elliott, do you know you are trying my patience sorely? No; no more tears, my child," with a touch of peremptoriness. "I see I shall have to make you afraid of me, after all. What has my cousin said or done to annoy you?"

No answer; only the tell-tale crimson mounting to the very roots of her hair.

"Beatrix and you had a long talk together yesterday. Trichy had a fit of vapors, which certainly lasted all the evening, for I never saw her so unlike herself; even Mrs. Fortescue noticed it. And I have never known you before suffer from these intense sick-headaches."

"One must be ill sometimes," she returned, evasively.

"Do you think it cures them to do without your night's rest? You understand nursing very poorly,"

with a keen glance that made her shiver. How had her long vigil reached his ears? Could Phyllis have betrayed her?

Her miserable night was not the best preparation for the endurance of the day's trial. Dym felt so weak and wretched that she was utterly defenseless; not a spark of her old courage remained. She must guard her secret—so much her woman's pride told her—but after that it mattered little what became of her.

The pale rigidity of her features smote Guy Chichester's heart with generous pity.

"Forgive me if I pain you," he continued, gently, "but it is my duty to find out this. Would you rather have me speak to my cousin?"

"No—oh no!" in a deep voice of misery.

"Then you must be perfectly frank with me yourself. Tell me, Miss Elliott, have Beatrix and you quarreled?"

Dym considered a moment. "Not in the way you mean. We disagree in opinion: that is all. Wait a moment," pressing her hands on her temples in a bewildered sort of way, as though trying to collect her thoughts for a great effort. "I want to tell you something, Mr Chichester: you may have to know it soon—I have made up my mind to leave Ingleside."

"To leave us!" in a tone of astonished incredulity.

Dym had made a desperate plunge; she went on rapidly. "It was you who brought me here first, and you have a right to know. Flossie can do without me now, and your mother will easily find some one else to replace me. I have quite made up my mind to go; nothing you say can shake my resolution."

"Then in that case I need not try," was the somewhat dry rejoinder. "I suppose I may ask the reasons for this sudden and singular resolution?"

Her reasons! Dym was reduced to silence now.

"Have I unfortunately done anything to displease you?"

"You Mr. Chichester? oh no." Dym's grateful look was sufficiently eloquent.

"My mother, then?"

"Your mother is goodness itself. She is the dearest, the kindest——" Dym was nearly breaking down again.

"Then it is as I suspected, and Beatrix is at the bottom of the mischief. Oh, you women!"

getting up from his seat and pacing the room impatiently. He was becoming angry now.

"Mrs. Delaire has never liked my being here," went on Dym, in a stifled voice; "she says and thinks things that make me wretched."

"Has she said anything that makes it impossible for you to remain?" demanded Mr. Chichester, sternly. There was no misunderstanding his meaning. Dym grew whiter and whiter under those searching eyes.

"You need not answer. I begin to have a glimmering of the truth now. You could not tell me this yourself, of course. Never mind: I will take steps to silence Beatrix's nonsense. I would not have believed it of her," he muttered, still more angrily.

He was about to leave the room, when a sudden thought seemed to strike him, and he made a hasty stride back to her chair.

"If I make it all right—if Beatrix apologizes—you will not persist in your foolish intention of leaving us?"

She shook her head sorrowfully. "There is no apology needed. You are mistaken, Mr. Chichester. I must go."

"Nonsense!" he continued, impatiently; "you know so little of the world that you are not competent to decide on this point. Fools will talk; but wise men will not heed them. You are justly hurt and aggrieved: when you are older these things will not sting quite so badly. Leave me to bring Beatrix to reason; she shall apologize to you before many hours are over. Don't you know it would break my mother's heart to lose her adopted daughter?" He was turning away again, but Dym sprang after him and laid her hand on his arm: her face was perfectly ghastly.

"Mr. Chichester, you must not; I cannot bear it."

"I must not do what, my child?"

"Speak to your cousin. She is not to blame; she meant to be most kind. It is not her fault that I am in a false position. It is my own wish; I must go."

His pertinacity seemed cruel. It was depriving her of her last chance.

"You must allow me to judge whether I am to speak to my cousin or not." And there was a touch of haughtiness in Mr. Chichester's manner. Dym's look of mingled reproach and despair protested silently against his harshness.

"Can you not trust me?" he asked, more gently. "Your brother would not have recommended your acting for yourself in such an emergency."

"Oh, Will! Will!" Dym could not quite suppress the ring of misery in her voice. She let Mr. Chichester place her passively in a corner of the couch. Even before he left the room her head dropped on the cushions with a child's utter abandonment of weakness. She had fought out her piteous little battle, and had been worsted. In spite of her desperate determination, she had felt a very reed in the hands of this man, whose will was so strong and arbitrary for good. He had not suspected her secret; he had attributed her reluctance to remain to mere motives of maidenly modesty. Beatrix had told her she was in a false position; but would Mrs. Delaire guard it equally well? Dym in her innocence thought she would certainly try to shield her, and if it had not been for Beatrix's evil temper she would have been perfectly right in her surmise.

But Guy knew how to be provoking, and it was not easy to evade his lynx-eyed vigilance. The interview between the cousins was a long and stormy one, and when it was over Beatrix shut herself up in her own room for the remainder of the evening.

When a short time had elapsed, Dym made an attempt to go up to Mrs. Chichester, but the first movement brought back dizziness and faintness, and she was obliged to remain in enforced idleness. Phyllis brought her luncheon. Mrs. Chichester had gone down to the vicarage—Mrs. Fortescue had sent for her and Florence. Phyllis thought Mrs. Delaire had gone with them. The squire had started for a long walk with Kelpie, and Mr. Nethcote had sent up to know how Miss Elliott was.

"And I might have told him, miss, you were looking rarely worse, for there isn't a speck of color in your face," added Phyllis, in a vexed voice. Dym smiled faintly. It was a relief to own herself really ill, and decline the tempting meal Phyllis's foresight had prepared. She drank some wine and lay down again. This perfect quiet was bracing her numb faculties to fresh efforts. She must face her difficulties, and not sink under them; she thought, come what might, she must not forfeit her own self-respect.

She had fallen into a slight doze in the twilight,

and had just awakened with a start, when there was a light tap at the door, and Mr. Chichester entered.

"You are just where I left you this morning," was his only greeting. "I told them not to disturb you. I hope you have properly repaired last night's ravages."

"I am better, very much better," she answered gratefully. "Has Mrs. Chichester returned yet?"

"Yes, my mother has come back, I believe. I saw Florence just now," rather absently. "Miss Elliott, without renewing our previous conversation, I want you to make me one promise."

"If I can—that is, if it be right," she returned, timidly, glancing up at him. Was it the firelight, or did his face look strangely pale and drawn?

"Promise me that you will not speak to my mother about leaving us for three days, not till I have spoken to you again; only three days, remember."

"I can easily promise that."

"Beatrix tells me she had no intention of hurting you with ill-timed advice. We must give people their due—we all have our faults. If I might venture on giving you advice, Miss Elliott, it would be to dismiss all this from your mind for the next three days; be calm, be content, and trust me." As he spoke, he put his hand upon her head with a fatherly gesture; and, looking up she saw the sad kindly gleam of his eyes.

A moment after, the door closed, and Guy Chichester was alone—never more alone!

Alone! Alas, what bitter thoughts were lining the man's brow as he stood with arms tightly folded across his breast, and the flickering firelight playing on his bowed head and gray beard.

"Who would have thought of this?" he muttered. "Poor innocent child! and to think Beatrix is making her her dupe; there was heart-break in her face. I could see it for myself; and yet fool that I was never to dream of that! and then my mother and Florence—Florence will fret herself to death for her. Is there no other way, no other way but this? Oh, Honor, my darling, my darling, the only woman I ever loved, or that I ever can love, come to me one moment and tell me what I am to do in this sore strait." He spread his hands with a groan into the empty air, and then they dropped heavily to his side. Alas, these hours of desolation and anguish were not new to the lonely man, but to-night his soul was torn by

conflicting passions, generous pity for the girl he had befriended, tender compassion for his mother and child, whose lives were so closely bound up with hers. At times the whole chivalry of his nature seemed to rise up and plead for these defenceless ones. "If I can make them happy, what does it matter what becomes of me?" he thought. "She will be a mother to my child; she has never known any other; she is the sunshine of our house. Lonely as I am now, I feel I shall be doubly so if she leave us. No, for my own sake I cannot let her go; and yet is there no other way than this?" He sighed heavily as the gong disturbed him from his musing.

It was a silent party that gathered round the dinner-table that night; Beatrix was absent, the squire taciturn and gloomy, Dym sad and conscious and shrinking from notice. Once, and once only, during the evening, Guy roused from his reverie. Florence had clambered up into Miss Elliott's lap for a good-night kiss. Mr. Chichester suddenly raised his eyes and regarded the pair long and fixedly. The child had her arms tightly round Miss Elliott's neck, the bright golden head reposed lovingly on her shoulder; the two were whispering their confidences together. "You must carry me up to bed," begged Florence, sleepily rubbing her eyes; and Dym rose obediently.

"You must say good-night to papa, Flossie," she whispered, and she held out the child to him as she spoke. Guy stooped over them both as he kissed Florence fondly; he shielded his eyes and watched her as she left the room, still carrying the child. What a young creature she looked! a small slight figure in a white dress, with a sweet, dark face that he had somehow grown to love.

She was not far off being very pretty, he thought to himself; there was such a tender, appealing look in her eyes sometimes, and the small shining head was set so daintily on her slim throat; how pleasant the touch of her hand had been to him when he had stood alone with her that wild March morning; but even as these thoughts flitted through his mind, there suddenly came before him the vision of another face—a grave, beautiful face—with a broad low brow and solemn gray eyes that opened softly. "There was none like her; no wonder the angels claimed her so soon, she was too good for earth," he sighed. A moment after, when his mother spoke to him, he left the room, and no one saw the squire's face again that night.

Dym never spent such a strange three days in her life. A sort of oppression and unreality was upon her. At times her conversation with Beatrix appeared a dream. Mrs. Delaire, when she met her next, seemed strangely subdued, and treated her with marked kindness. It was true Dym did not respond to her advances: the girl was so sore of spirit that a word wounded her; she shrank away from the least approach to confidence on Mrs. Delaire's part, and confined herself entirely to the society of Mrs. Chichester and the child. She would sit for hours at her friend's feet, looking up at the blind, placid face as though she were learning how to take leave of it. Mrs. Chichester hardly knew what to make of her *protégée's* silence and sadness.

Dym only saw Mr. Chichester in the evening, and then he scarcely ever addressed her. Each day his face seemed to grow thinner and sadder. Dym's heavy heart grew heavier as she looked at him.

He must be hurt with her, after all—he was sorry she was going—he was sad, displeased. Poor Dym! There was no form of self-tormenting in which she did not indulge during those endless three days.

They came to an end at last.

Dym had been sent to the library on some trifling commission. Mr. Chichester was going out, and wanted some papers copied. Guy never asked his cousin to do anything for him now—so Dym sat through the long afternoon, accomplishing her task with her usual neatness and despatch, till the last sheet was finished. She was still stooping over her work, when the squire entered, bringing a current of fresh air with him.

"I am afraid I have set you too long a task," he said, looking over her shoulder. "How neatly you do this work? You would make a capital copying-clerk. Come to the fire and rest a little. I am sure both eyes and hands must be weary." And as Dym hesitated, he quietly added, "I want to speak to you," and Dym had no alternative but to obey. Mr. Chichester followed her, and took up his old position. "My three days' grace has expired, I believe," he said, looking thoughtfully, not at her, but at the fire, "and you have a right to expect that our painful conversation should be renewed. Do you still persist in your former resolution, Miss Elliott?" turning on her so abruptly that Dym started; but she contrived to answer him with tolerable firmness.

"I have quite made up my mind to leave Ingleside and seek another situation."

"And you decline giving me your reasons?"

"I cannot—that is—I hoped that you would understand that—you would not think me ungrateful, I mean," faltered Dym, growing white again.

"You need not fear misconstruction from me," he replied, calmly. "As far as I can judge of your motives, they do you infinite credit. My cousin has unfortunately raised a question that ought never to have been mooted, and I can well understand that you cannot remain here happily in your present capacity."

"I am glad you approve——" she began, in a timid voice, and then stopped.

"Pardon me, I disapprove so strongly that I do not mean to let you go—if it be in my power to keep you—Miss Elliott," speaking now very gravely. "After what has passed, there is only one way in which you can remain happily under my roof, and that is—do not be startled, my child—by becoming my wife."

"Mr. Chichester!" Dym rather breathed than said the words; her infinite surprise almost deprived her of utterance.

Mr. Chichester stood and watched her varying color sadly, and then he came up to her and took her hand.

"I asked you to trust me. I have thought over it all; believe me this is the only way. Is the idea very repellant to you?" endeavoring to get a glimpse of her downcast face. But Dym hid all of it she could.

"No! oh, no! but I am so unworthy," she whispered; "and then you do not love me, Mr. Chichester?"

"I have something to ask on the other side of the question. Do you think you could care for me, Dym?"

He had never called her by her name before, and the word thrilled her with incredible sweetness. Care for him! did she not love him so that her heart was nearly breaking within her?

She lifted her face, covered with burning blushes, to answer him. Something in the

strangely, for he suddenly drew it to him and kissed her brow.

"It is settled, then. But, my child, I want you to listen to me for a moment. I will believe that you can care for me, gray-haired, middle-aged man that I am, whom trouble, and not years have made hard and stern. But on my part I dare not deceive you. The best part of my life, my hopes, my love, is buried in Honor's grave."

She pressed his hand timidly—the kind hand that had done so much for her and hers: he need not have told her that, she thought.

"You are so young that you have a right to expect an undivided heart. There are many men who would give you their best and truest love; I am not one of those, Dym."

"I know it," she whispered. "I do not expect it. I never dared hope for even this."

He smiled a little at the childish *naïveté* that betrayed so much: and then his tone resumed its gravity.

"When I lost Honor I lost the dearest thing earth had to offer me. I knew when she died I could never love any woman again as I had loved her. In some sense I am a broken-hearted man for life; but I think"—his voice changing into tenderness—"I should be a little less lonely if you will come to me, my dear."

And this from him. Dym was fairly weeping now.

"I have always loved my little friend dearly; she has come into my desolate home and made it pleasant to me. May I hope to keep her there always?"

No answer, only as his hand touched hers caressingly she suddenly stooped, and her girlish lips set the purest seal to her long love and fidelity.

"God bless you, my child! I will try to make you happy," were Guy Chichester's last words to her that night; and Dym's affection and loyalty found no fault with the sadness of his tone. Was she not his own—did she not belong to him—her lord, her benefactor? Dym's tumultuous heart could find no room for doubt. With such thoughts as these she lay down to sleep that night, like a veritable child wearied out with overmuch joy, and oblivious of clouds of to-morrow.

## AFTER A HUNDRED YEARS.—SOME SINGULAR COINCIDENCES.

BY JAMES HUNGERFORD.

## IN TWO PARTS.—PART II.

## CHAPTER IV. JUSTICE DELAYED.

HE opened the package, and, as he handed the papers to me one by one, described them:

"Here is a small Bible which my mother gave me when I left home for the army; it has her handwriting on a blank leaf. Here is a package of letters which I received from my father and mother while I was with the army. Here is a certificate of my enlistment; another of my honorable discharge. Here is a statement sworn to by twelve respectable and disinterested persons, and taken since my return from the army, establishing my identity. Here is a certificate of the marriage of my father and mother, and a certified copy of their marriage license; fortunately, the minister who performed the ceremony is still alive. And here is a certificate of my birth, sworn to and signed by the doctor and the nurse, both of whom are also yet living."

"Are there any affidavits to the genuineness of the handwriting of the letters from your father and mother?" I asked.

"Yes, sir," he answered; "there are also twelve of them. They are attached to the package of letters. There are plenty of persons besides who will testify to the handwriting of my father and mother, and, as to that matter, to my own identity."

"If you will leave these papers with me, Mr. Brantley," I said, "I will examine them. How long do you remain in Leonardtown?"

"I shall not leave until the day after to-morrow," he replied. "I will stay longer if you need me."

"Very well," I said. "Call and see me again to-morrow at ten o'clock in the morning."

Before he left, however, he told me that he made a scanty support for himself and his child by teaching a small school in Medley Neck. "Medley Neck" is the name of one of the old "Hundreds" of St. Mary's County.

June 6th, 1785. Mr. Richard Brantley came this morning at the appointed hour. I have determined to undertake the case, and shall file declaration and order the issuing of the original

writ forthwith. There never was a juster cause in any court in Christendom—or elsewhere.

I learned, during Mr. Brantley's visit to-day, that Mr. Key's impression was not so far wrong as I thought it was yesterday. Richard Brantley's mind is evidently much weakened by the physical and mental suffering which he has borne. He was very childish to-day in his complaints of the ill-treatment which he has received, not only from his cousin, he said, but from "everybody." Even the little girl—"Honora" he called her—seemed to be ashamed of him.

Baltimore City, October 12th, 1792. Having to-day come across the above note, and the package to which it is attached, while engaged in search of some old papers, I think it well to add a statement here, comprising all that I know concerning Mr. Richard Brantley's affairs, in addition to what I have already noted above. This writing may, perhaps, at some future day, cause justice to be done to his descendants.

I brought suit; but, within a few weeks afterwards, I received so promising an offer of partnership from my old college-mate and friend, James Harley, already established in successful practice of law in this town, that I did not consider myself justified in declining the opportunity to better my fortunes.

I left Richard Brantley's suit in the hands of the young lawyer Joshua Jones, whom Mr. Brantley had spoken of to me, thinking him best informed in regard to the business. Indeed, I found no other member of the bar disposed to take hold of the case; and even Mr. Jones, I think, was induced to do so mainly by my leaving other and, as he considered them, more "paying" cases to his care.

A month or so after I left St. Mary's County, Richard Brantley, having been offered a school in the western settlements of Virginia, went there with his little girl. I suppose he had but little faith in Mr. Jones, having tried him before to no purpose, and had come to the conclusion that all hope of obtaining justice was gone.

All that Mr. Jones did with regard to the business was to see that judgment by default was so entered against his absent client as not to interfere with any future efforts which might be made to obtain justice for him. WALTER TOLYER.

#### CHAPTER V. FROM THE DUST OF YEARS.

AFTER reading the manuscript of my maternal grandfather, I examined the package beneath it. I found the contents to answer precisely to Richard Brantley's description of them as recorded above.

Some passages in the letters, and especially the inscription in the little Bible, were very affecting to one acquainted as I was with the subsequent ill-fortune of Richard Brantley. But the quotation here of these passages would but delay the denouement of my narrative, and would, therefore, prove less than interesting to the reader. So I omit them.

"Well," I thought, after I had concluded the examination, "here is a just claim which has lain dormant for almost a century. If an heir of Richard Brantley can be found, and the descent of such person established, Brantley Hall may still be recovered for a rightful claimant. And I should like to be an instrument in causing justice to be done even at this late day."

What steps should I take to ascertain whether or not Richard Brantley had descendants, or a descendant, living? Should I advertise in the papers? There might be objections to that course; I would wait awhile and consider the *pros* and the *contras* of it.

Then this Miss Honora Brantley Hall! I had more reason now to be interested in that name in reference to the matter. "Honora" had also been the Christian name of Richard Brantley's daughter.

Of course, Honora Brantley was, in all likelihood, dead; for, if living now, she would be nearly one hundred years old. But this Miss Hall, bearing the full name of the former in addition to her own patronymic, was not only possibly, but probably, a descendant, or otherwise relative, of Honora Brantley.

If I could get an interview with Miss Hall, it was likely that this question would be solved at once. It was more than probable that she lived in Baltimore—else why should a letter be addressed to her here? But how should I learn the street and number of her residence?

I looked into the Baltimore City Directory for 1876. There was a large number of Halls; but among them all was not one Honora Brantley Hall, or even Honora B. Hall.

Should I advertise for her in the daily papers? But that course might prove unpleasant to the lady, or might raise expectations not to be realized.

I determined to devote a few days to private inquiry, and then, if unsuccessful, to advertise for her. If I should fail to secure an interview with her, or, having secured such an interview, should learn that she is no descendant of Richard Brantley and knows nothing of such a person, I would then advertise in all the Baltimore daily and weekly papers for information concerning the descendants of him—the revolutionary soldier—who, while living, was deprived of his rightful heirship to the Brantley Hall estate.

It is necessary that I should make here a brief statement with regard to my law firm:

The first partnership was formed between two grandfathers, and was styled "Harley Tolyer." My father, John Harley, was taken into this partnership when admitted to the bar.

After the death of my grandfather Harley, the firm was entitled "Tolyer & Harley." As John Harley had married the daughter of Walter Tolyer (after whom, by the way, I was named), it seemed more appropriate that the name of the father-in-law and the older man should hold the place of senior partner.

On my admission to the bar, I was taken into the partnership; and when my grandfather Tolyer died the name of the firm was changed to "Harley & Son."

After the death of my father I conducted the business alone for a year or two under the same title, intending to take my son John into partnership after he had passed his legal examinations. This event took place in the spring of 1875.

Gaston Willoughby, a college mate and bosom friend of my son, finding life uncomfortable without the companionship of John, entered my office as a student two or three years ago. He was admitted to the bar in the spring of the year 1876.

During the years of Gaston Willoughby's studenthood I have become almost as much attached to him as John is. He is a young man of a cheerful, amiable and loving disposition. Finding him honorable, talented and energetic, in fact, competent in all respects, we offered him the place of junior part-

firm. This offer he accepted; and the ship is now entitled "Harley, Son & Co." Willoughby is the son of Edmund Willoughby Esq., of Willow Grange, in Prince George's County, Maryland.

#### CHAPTER VI. MISS HONORA BRANTLEY HALL.

The morning after my examination of the Brantley papers, Gaston Willoughby and I were alone together in the inner room of the office, both of us being engaged in writing, and attending to a case in the City Court. On the occasion to use a law volume which I had found on Mr. Willoughby's desk, I left my seat and went into the room to get it. As I bent over his desk to reach the book, my eye was involuntarily attracted by the address on the envelope of a letter, lying between me and the volume that I was about to take up:

Miss Honora Brantley Hall,  
No. — W. Fayette Street,  
City.

"Tell me, Gaston," I said; "I did not intend to read the address on this letter, and should not have gotten it in a few minutes, but that the envelope which much interests me. Are you acquainted with the lady?"

The young man seemed to be startled and confused by my question; his face was instantly

pale that I have not offended you," I said. "No, not at all, sir," he replied. But he appeared to be confused, and did not answer my question.

"Do you have any objection, then, to satisfy my curiosity?" I asked, after a slight pause. "It is no objection, and has, I think, a good object."

"I have no objection in the world to answer your question, sir," he replied. "I know the lady very well. And, Mr. Harley, your letter reminds me of a matter concerning which I have been wishing to speak to you for some days. I will give you my advice, and probably your active assistance."

The young man still kept his eyes bent upon his desk, and the color in his face faded from rosy to

pale. "I know, Gaston," I answered, "what a deeply interesting subject I take in all that concerns you. I will, with pleasure, advise and assist you in every worthy object; and I am sure that you

would entertain no other. I will be governed, in any affair in which you need my assistance, by all the consideration and sympathy of a father."

"With more sympathy than of a father—at any rate, than of my father—in this case, I hope," he said, with his eyes still bent downward. "I have been for months truly and warmly attached to the young lady to whom this letter"—placing his hand on it—"is addressed; and the attachment is grounded in an appreciation of her true and noble worth. I am convinced that my love is returned. But my father refuses to sanction our marriage, for the sole cause that she is poor; and she will not consent to a union with me without his approbation. I wish you, Mr. Harley, to give me your advice in the matter, and"—here was the gist of his desire in regard to my services—"to try, if you please, to induce my father to consent to our marriage."

"Of course, John is aware of this attachment of yours?" I asked.

"Yes," was the reply, "and he approves of it; he knows Miss Hall. He advised me to consult you."

Here he raised his head, and looked into my face, with a smile which expressed his impression that John's approbation would have a favorable influence on me. And his impression was right. I have great faith in John's uprightness and in the correctness of his judgment.

"I wish to become acquainted with the young lady before I take any steps in the affair," I said. "And I have another reason, too, for desiring to know her. You have not forgotten that I spoke just now of being much interested on seeing her name on this envelope. I will tell you the cause of my interest."

I then related to him, in outline, what I have been telling to the reader; about the advertised letter, my grandfather's notes, and the Brantley papers.

He was much interested.

"Brantley Hall!" he exclaimed. "Why, my mother's name is Alice Brantley; and that estate was hers when she married. It is still in our family. I have often wondered whether Miss Hall—having Brantley for her middle name—was related to us or not. I have also wondered why she prefers to be addressed in letters by her full name. All the reason that I can obtain from her for this preference is that it is due perhaps to a

traditional family superstition. By-the-by, this peculiarity may have some connection with the remarkable relation which you have just made to me."

"I think it is probable," I said; "and this is my reason for wishing to have a conversation with the lady."

"I will open my letter," said Gaston, "and add a postscript, informing her that I shall bring you with me when I call to see her this evening. The reason, by the way, why her name is not in the City Directory is that she came here only last January. She is boarding with a private family, and is attending the Normal School, to prepare herself to make her own support by teaching. The small property left by her father at his death is sufficient for this purpose, as, being an only child, she is his only heir. Miss Hall is doubly an orphan, for her mother, as well as her father, is dead."

Gaston then opened the letter, added the postscript, placed the sheet in another envelope, wrote the direction on the letter, and then went down into the street to place the missive in a mail-box.

#### CHAPTER VII. A FAMILY RECORD.

WHEN I was introduced to Miss Hall that evening, I found her to be a lovely young lady, with graceful and winning manners and a refined expression of face. I formed, during the evening, a high opinion of her mental and moral worth. I noted, also, her evident attachment to Gaston, notwithstanding her maidenly efforts to suppress exhibition of it.

As there was other company present besides Gaston and myself, there was not a good opportunity of introducing the subject which caused my visit.

I stated to her my desire to have a private interview with her, and requested that—as the next day was Saturday, and her attendance would not be required at the Normal School—she would allow me to call on her at ten o'clock the following morning.

She seemed surprised, but readily made the engagement.

When I called the next morning, I found her alone, and at once entered upon the object of my visit.

"I have learned, Miss Hall," I said, "that your middle name is Brantley. May I ask, are you

related to the Brantley family of St. Mary's County, in this State?"

"I am, sir," she answered. "But why do you ask the question? I have reason to be much interested in such an inquiry."

Her manner plainly showed the interest which she expressed.

In reply, I told her of my having seen her name in the list of advertised letters, and of the middle and last words of that name seeming familiar to me; of the consequent search among my grandfather Tolyer's papers; of the discovery of the letter marked "Richard Leigh Brantley," and of its contents.

"This is very remarkable, Mr. Harley," she said. "In conversation with Mr. Willoughby I learned that his mother was a Miss Brantley, of Brantley Hall, St. Mary's County. This reminded me of a Bible belonging to me, containing very full family records, which was once the property of one of my great-great-grandfathers. It was in the care of Colonel Amery, of Salem, Virginia, my uncle on my mother's side and my guardian. I wrote to him to send it to me. The letter, the address of which you saw in the advertised list, was from him in reply, intended to inform me that he had forwarded the book to me by express. With the carelessness of which he is often culpable, he neglected to add my street and number. That omission of these seems in this instance to have been providential, since it drew your attention to me. The package containing the book was indorsed with my address in full, and came safely to my hand this day week."

"Will you let me see the book, Miss Hall?" I asked.

"Certainly," she said.

She left the room. Returning in a few minutes she placed on a table near me a large old quarto family Bible, in the old-fashioned type and substantial binding of a hundred years ago.

Opening the volume at the end of the Old Testament, she drew my attention to the family record.

Before the leaves devoted to the registering of marriages, births, and deaths, several sheets of foolscap paper were firmly fastened.

On these were pasted what I afterwards ascertained to be certificates, in legal form, verifying every marriage, birth, and death in the family from the year 1795 down to the birth of the youngest lady before me. The first of these leaves, however,

contained the following lines, written in a beautiful old-fashioned round-hand, and with ink that was still unfaded:

"SALEM, VIRGINIA.

On this 28th of November, 1809, I here record, and do all that is in my power to aid in the future redress of a most grievous wrong, and to restore to my descendants the rights of which I have been despoiled.

I am the only child and rightful heir of William Gough Brantley, of Brantley Hall, St. Mary's County, Maryland.

While I was serving in the army of my country, in the war of her independence, my father and mother died. My unnatural cousin, Thomas Brantley, pretending that I was slain in battle, took possession of all my father's property. When I returned to St. Mary's County, after my honorable discharge from the army, diseased and enfeebled in mind as well as body by my wounds, he denied my identity, and still deprives me of my rights.

No one, having the means, has shown any disposition to aid me in obtaining redress.

Walter Tolyer, lawyer, of Baltimore, Maryland, has in his possession important papers, which are necessary, at this late day, to the establishment of my claims. Since my life has become more settled of late years, I have written to him to return them to me. I have received no reply from him.

Nevertheless, trusting that a kind Providence will cause those papers to be taken care of and produced at His own fitting time, I urgently desire my descendants to follow and fulfill my advice as follows:

Let every marriage, birth, and death of my direct heirs be plainly recorded in this book, and let legally authenticated certificates, verifying each record, be firmly pasted on the blank leaves which I have inserted here. Moreover, let every member of the family bear Brantley as a middle name.

I have entered, in their proper places in this volume, all the marriages, births, and deaths in my family, from as far back as my memory retains record of what I have learned of them, to the birth of my daughter's son—and so far, only child—who is named after me.

RICHARD LEIGH BRANTLEY."

#### CHAPTER VIII. RESTORED AT LAST.

I have no means of learning the reason that Mr. Richard Brantley's letter, above referred to, was

not answered by grandfather Tolyer. I have heard my father speak of each of my grandfathers having had, at the same time, a severe and protracted attack of typhus fever in the early part of this century. Probably the letter arrived during their illness, and was mislaid and lost before their recovery.

I shall not trouble the reader with all the details of the records in the old family Bible. The following excerpts are sufficient to show Miss Honora Brantley Hall's direct descent from Richard Leigh Brantley, and her exclusive heirship to his rights of property:

"William Gough Brantley was born in 1730, and was married to Viola Leigh in 1755; he and his wife died in 1780, leaving one child, Richard Leigh.

"Richard Leigh Brantley was born January 21st, 1757; was married to Honora Wysham January 21st, 1777; and died June 18th, 1810, leaving an only child, Honora.

"Honora Brantley was born October 28th, 1777; was married to William Hall December 18th, 1795; and died July 10th, 1830, leaving one child, the only survivor of several, Richard Brantley.

"Richard Brantley Hall was born January 5th, 1797; was married to Agnes Wilson May 1st, 1825; and died June 4th, 1835, leaving one child, William Brantley.

"William Brantley Hall was born August 20th, 1830; was married to Mary Violet Amery February 10th, 1855; and died April 13th, 1874, leaving one child, Honora Brantley.

"Honora Brantley Hall was born June 3d, 1857."

This family record, supported by the papers in my possession and by legally authenticated certificates in regard to every important event, rendered Miss Honora Brantley Hall's claim to the Brantley Hall estate irresistible.

Mr. Edmund Willoughby, of Willow Grange, Prince George's County, Maryland, after an examination, link by link, of this chain of evidence, no longer opposed the marriage of his son to Miss Hall, and proposed to settle Brantley Hall on the young couple.

The young lady, however, insisted that a suit should be instituted in her name in the Circuit Court of St. Mary's County, and a judgment in her favor be obtained in due legal form. This she required to be done in justice to the memory of

her great-great-grandfather, Richard Leigh Brantley.

Her desire was fulfilled. My son John wrote and filed the bill of complaint, in the equity case of "Honora Brantley Hall vs. Edmund Willoughby and wife." The respondents, represented by Gaston Willoughby acknowledged, in their answer, the justice of the complainant's claim; and the decree of the court declared the young lady the rightful owner of the Brantley Hall estate.

Of course, on account of the engagement of

marriage between the complainant and the court, the right to mense pro was waived.

Gaston Willoughby and Honora Brantley Hall were married on the Centennial birthday of our national independence, the fourth day of July, 1876, a few weeks after the issuance of the decree of St. Mary's County Circuit Court, sitting in equity, which restored to her the estate which had been unjustly withheld from her family for a century.

### SEARCHING FOR DIAMONDS.

It is barely ten years since the first diamond ever found in the Cape Colony was taken away from some little Dutch children who were playing with it, and now the annual value of the exports in these gems is to be counted by tens of thousands of pounds. Nor is there any fear that the diamondiferous soil is being worked out; on the contrary, the greater the depth reached by the elaborate machinery which is daily taking the place of the more simple contrivances originally used, the more satisfactory are the results. To the generality of readers the geography of South Africa is so vague and unknown that a more particular description of the localities whence the diamonds are brought cannot fail to be a necessary prelude to the due comprehension of any information regarding them. Some 600 miles inland, as as the crow would fly, to the northeast of Cape-town, lies a small territory lately acquired by the British Empire by cession from the Chief of the Griquas, and known as Griqualand West. A certain rather important portion of it is still claimed in amicable fashion by the Orange Free State, and the exact question of the boundary line is barely settled. Only 100 miles from north to south and 150 from east to west, it yet attracts a population which is numerically great as compared to the meagre returns from other parts of the colony. 15,000 white people, 10,000 colored and 20,000 native laborers make up a respectable total of inhabitants, especially as they are nearly all centred in one spot.

Diamonds were at first found singly and scattered along the course of the Orange and Vaal

rivers, and diggings were established in various promising spots. Attempts were also made to find whether the natives had ever thought it worth while to collect and preserve any of the shining stones, and in this way the famous "Star of South Africa" was purchased from a Caffre witch-doctor, but no other equally valuable stones have since come to light in the same way. The digging at first was mere surface scratching, and it was only five years ago that the now famous Kimberley mine, originally known by the rough-and-ready name of New Rush, started into existence. Unfortunately, diamond digging is fatal to the symmetry or beauty of a landscape, and Kimberley resembles nothing so much as a giant ant-hill crumbled into ruins, with the swarming inhabitants busy repairing damages. But no filling-up, smoothing-over process is really at work; each day the earth is turned over, fresh claims, divided and subdivided into minutest sections, are being worked, and over all the confused heap of excavations stretches a labyrinthine net-work of wire rope, seventy feet above, by which to haul up the buckets of wash-dirt.

The first diamonds were found very close to the surface by the river banks, and even heavy rain would affect the quantity discovered. They had to be washed out of the gravelly soil by a cradle, such as is used by gold-diggers, and, considering the rude and imperfect nature of the process, the quantity found even then and the quality of the stones were suggestive of vast treasures concealed. Yet the report of more than one geologist sent out expressly for the purpose

frica was distinctly non-diamondiferous; the stones found by the river-side were alluvial, and the claims would be worked to a depth of five or six feet, which was actually in spite of all this, diggers swarmed to the valley of the Vaal, camps sprung up in the country, solitary Boers who had not seen half a century together in their lives woke of a sudden, and as many hundreds hard at work by the river waiting to ask at what price they would sell their barren acres. Of course the vicissitudes were great, and men were ruined by turns, and by turns the same African Diamond Fields rose and fell. Until the system of dry digging had been established—five years ago, at New River, it ousted the Kimberley mine—that dry digging took its place as one of the chief industries of the world, and that a mining town has sprung up around the place which encloses unknown wealth. Dry digging was hasty and superficial, as was the old method, but when the ground came to be fully parcelled out, the debris already lying on the surface and supposed to have been carefully examined, by the new process of water-digging, was found to bear on it, diamonds to the value of £1,000,000. In fact, the value of the soil of this especial mine will be estimated by the statement that from 90 to 95 per cent of all the diamonds exported from South Africa come from the Kimberley mine, and yet the mine only extends over some nine acres. Since it has been worked down the average value has been in value £100,000, and at a depth of five feet below the surface diamondiferous ground has been struck.

In spite of these stubborn figures and facts, it will, however, always be a mystery to geologists why so great a profusion of diamonds should be hidden in ground bearing so few of the characteristics of the best-known diamond mines elsewhere. It can only be accounted for by a theory of eruption, and this is supported by the constant intrusion of broken rock, limestone, shale, and basalt into the true diamondiferous ground. Besides which, it is also a singular fact that different parts of the mine—and it should be recollected how close such parts must be in so small an area—produce totally different diamonds as to color and weight. These precious nine acres pay a royalty of £6 per annum for every 31 feet square, and there is besides a license on the diamonds found. The mine at Kimberley is surrounded, as are most of the mines, by a girdle of distinctly non-diamondiferous rock, and it is from this sort of basin-like form that the Dutch took their word "pan" as the earliest name for the depressions holding the rich deposits here and there. In contradistinction to this is the term "koes," a hillock; and although diamonds have been found in small quantities in the "koes," still it is into the "pans" or reservoirs that the true diamondiferous material has evidently been washed. It is curious, too, that these "pans" are all surrounded by the same sort of ring of porphyry, or green stone, and that other precious stones of less value, such as emeralds, rubies, and sapphires, are also found, with large quantities of garnets. The water struck below the surface in some of the "pan" is salt, and the color of the diamond-bearing clay changes from yellow ochrous to bluish-gray as it gets deeper. Indeed, many new and strange things come to light in searching for diamonds.

## MY RIVAL'S PORTRAIT.

By EMILIE TOLMAN.

ever considered a superstitious man. My wife was rather disposed to find fault with me, she called my want of faith in the future, and that she had any vulgar belief in omens. Like most women she had a love of the occult, and her theories of spiritual existence. I had never about to relate had happened to her,

I might have made some allowance for preconceived opinions; but with me it was another matter. Although I am aware that this narrative will be read with derision on the part of some, and incredulity on the part of others, I can but tell the things I have seen and heard.

My wife had a second cousin named Edgar

Lampson, who had once been my unsuccessful rival for her hand. There is no doubt he was madly in love with her; but he was a dissipated, bad-tempered man, and his devotion to her brought no return. Soon after Mabel and I became engaged, I chanced to meet him at the gate of her father's house.

With his white teeth gleaming savagely through his black mustache, he muttered: "You have crossed my path. Some day I shall cross yours."

Mabel and I were married, and for nine years lived quietly and happily. Edward Lampson's parting words, which had been uttered with such vehemence and determination as at the time to produce an uncomfortable impression, had almost faded from my memory. He had started for California a few weeks after our marriage, and had never been heard from since. All attempts to find him having failed, it was generally supposed that he was no longer among the living.

Meanwhile his father, my wife's uncle, died, bequeathing her a portion of his extensive property. Business relating to this legacy called me to the city where he had resided, and late one Saturday afternoon I ascended the marble steps of the spacious mansion which he had left to his widow.

Mrs. Lampson was out, but I told the servant I would wait; and, being ushered into the drawing-room, ensconced myself in a luxurious arm-chair, to enjoy my surroundings.

I could have easily entertained myself among the rare pictures and curiosities which adorned the apartment, but almost the first object that attracted my attention was one from which I found it difficult to withdraw it. Upon the wall opposite me was a life-like portrait of Edgar Lampson. There were the black, curling locks, heavy brows, and handsome features which I remembered so well. Whichever way I turned my eyes, those of the picture seemed to follow. At last I gave myself up to the spell. As I looked and pondered, the portrait seemed to move out from the wall. I thought it could not be, though the

illusion, for such I called it, gave me a feeling, and caused me to gaze upon the even more fixedly than before.

"It is a fine likeness. No wonder I felt for a moment it was a living thing." As I said this to myself, again it came out from the wall, trembled slightly and drew back.

The words, "You have crossed my path some day I shall cross yours," came to my mind. I felt almost as though the lips concealed behind the heavy black mustache, might part at any moment and show the white, gleaming teeth.

A third time it moved, advancing and retreating as before. There could be no doubt; it was now. I rubbed my eyes, to make sure they were awake. Then I looked about the room for an aperture from which a stream of air might issue sufficient to cause this singular phenomenon. The doors and windows were closed, and nothing else in the room was motionless.

As I said in the beginning, I never was considered superstitious; and I think I may claim my share of manly courage; but the fact that Lampson's portrait should actually start out from the wall before my very eyes, without any assistance, was appalling. The cold perspiration stood upon my forehead. After looking about the room in vain for any reasonable cause, I went back in my chair to wait for further developments.

How long I sat there, motionless and staring, I know not. My mind was in such a state of bewilderment, agitation, and indefinable excitement that it took no note of time. Still the portrait started back and forth; and my staring eyes were fixed upon it.

At length, determined to probe this mystery with one mighty effort I broke the spell, and came to my feet. Stepping quickly forward, I stretched out my hand to grasp the picture. It drew back from my side again instantly; for I perceived a current of hot air issuing from a register just under the portrait, and proceeding, doubtless, not from the spirit-world, but from some common-place stove below.

### MY CREED.

I HOLD that Christian grace abounds  
Where charity is seen; that when  
We climb to heaven 'tis on the rounds  
Of love to men.

I hold all else named piety  
A selfish scheme, a vain pretence;  
Where centre is not can there be  
Circumference?

## NOTES AND QUERIES.

**Coins of the World and their Value.**—The following list of the coins of the world may prove interesting to some of the readers of the MONTHLY, and will be found convenient for reference. It is compiled from the excellent Lexicon of Jabez Jenkins:

**Abri**, a Polish silver coin, about 24 cents.  
**Adarcon**, an old Jewish coin, about \$6.  
**Allevur**, a Swedish coin, about 1 cent.  
**Altin**, Russian money, about 3 cents.  
**Angel**, an old English coin, about \$2.40.  
**Anna**, East India money, about 3 cents.  
**As**, Roman money, about 3 cents.  
**Ascherh**, Egyptian money, about 1½ cents.  
**Ashraf**, Persian gold coin, about \$2.25.  
**Aslani**, Turkish silver coin, about \$1.40.  
**Asper**, a small Turkish money, 1-24th cent; Egypt, ¼th cent.  
**Atche**, Turkish silver coin, about 1½ cent.  
**Ajocho**, Roman money, about 1 cent.  
**Ascherh**, Egyptian gold coin, about 49 cents.  
**Atzen**, Swiss money, about 2 cents.  
**Aubee**, a half-penny.  
**Edidlik**, Egyptian gold coin, about \$4.97.  
**Atro**, a small Venetian coin, ½ cent.  
**Erant**, an old Byzantine gold coin, worth about \$2.25.  
**Isa**, a gold coin worth about \$1.  
**Languille**, a Barbary coin, about 3 cents.  
**Lure**, a Swiss coin, 2 cents.  
**Colle**, small Scotch coin, ½ cent.  
**Asasobattash**, Tripoli money, about 1 cent.  
**Roadpiece**, an old gold coin, value about \$6.  
**Yant**, a gold coin, \$75 or \$2.25.  
**Abcer**, a Mocha coin, about 60 cents.  
**Ascreen**, Chinese money, 1 and 4-10th cents.  
**Carlino**, Naples silver coin, about 8 cents; Sardinia gold coin, \$9.47.  
**Carolin**, Bavarian gold coin, about \$4.80.

**Cash**, a Chinese coin, about ¼th cent.  
**Carlillane**, Spanish gold coin, about \$2.30.  
**Cechin**, Sequin, about \$1.75.  
**Christiana**, a Swedish coin, about 14 cents.  
**Christian d'or** a Danish gold coin, about \$3.96.  
**Cistophorus**, an ancient coin, worth about 75 cents.

COINING AND FINISHING MONEY.

**Cobang**, Japanese gold coin, about \$3.57.  
**Cowry**, a shell used as money, 20 to a cent; in India, 60.  
**Crown**, silver coin, about \$1.07; gold, \$5.81.  
**Cruzado**, a Portuguese silver coin, about 48 cents.  
**Daalder**, a Dutch coin, about 60 cents.  
**Dawm**, an Indian copper coin, about 1½ cents.  
**Denari**, Tuscan money, about 11-12th cents.  
**Denarius**, a Roman coin, silver, 15½ cts.; gold, \$3.87.  
**Denier**, old French money, 1-5th cent.  
**Didrachma**, silver, about 30 cents.  
**Dollar (Rix)**, 95 to 105 cents.  
**Doppia**, Roman gold coin, about \$3.28.  
**Doubleloon**, Spanish gold coin, about \$15.57.  
**Drachme**, Greek coin, 17½ cents.  
**Ducat**, gold coin, \$2.25; Russian, \$2.75; silver, 83 cents.  
**Ducatoon**, kind of silver ducat, \$1.26.  
**Ecu**, a Swiss silver coin, 88 cents.  
**Escudo**, a Spanish gold coin, \$1.90.  
**Floren**, Florence, an old gold coin, about \$1.50.  
**Florin**, North German, 54 cents; Spanish, 42 cents; Austrian, 48 cents; gold, \$1.66.  
**Franc**, French money, 19½ cents.  
**Francescone**, Tuscan coin, \$1.03.  
**Franken**, Swiss silver coin, 27 cents.  
**Frederick d'or**, gold coin, \$3.96.  
**Genevoise**, Swiss silver coin, \$1.08.  
**Genovine**, Sardinian gold coin, \$15.17.  
**George**, a gold coin, about \$1.60.  
**Gerah**, Hebrew money, 3 cents.

Proshen, Prussian money,  $2\frac{1}{3}$  cents.  
 Groten, Dutch money, about 1 cent.  
 Guilder, Dutch coin, 42 cents; Guiana, 26 cents.  
 Guinea, English money, about \$5.  
 Halfjoe, gold coin, \$8.70.  
 Hamsee, Egyptian gold coin, 25 cents.  
 Hashreen, Egyptian gold coin, \$1.02.  
 Imperial, a Russian gold coin, about \$7.84.  
 Jacobus, an English gold coin, about \$6.  
 Joannes, a Portuguese gold coin, \$17.24.  
 Kopeck, Russian money, 1-100th part of rouble.

COIN OF CORINTH.

Kopfstuck, a Bavarian coin, about 16 cents.  
 Kreuzer, Austria, 8 1-10th; Baden,  $\frac{1}{4}$ ; Bavaria, 6-10th of a cent.  
 Lavin, a Persian wire coin, about 12 cents.  
 Leopoldone, a Tuscan coin, about \$1.05.  
 Li, 1-10th of a cent.

SHEKEL OF COPPER.

Libra, a Roman coin, about \$14.50; Spanish, about 56 cents.  
 Libra, south of Europe silver coin,  $18\frac{1}{4}$  cents.  
 Livre, an old French money, about 18 cents.  
 Louis d'or, French gold coin, \$4.50.  
 Maasha, an East India coin, about 5 cents.  
 Mace, Chinese money, 14 cents.  
 Macuta, Portuguese money,  $5\frac{1}{2}$  cents; Sierra Leone, 10 cents.  
 Maravedi, Spanish money,  $\frac{1}{2}$  cent.  
 Marengo, a Sardinian gold coin, \$3.79.  
 Mark, money of account, English, \$3.20; Scotch, 27 cents; German currency, 30 cents.  
 Medine, Turkish coin,  $3\frac{1}{2}$  cents.  
 Medio, Spanish coin, 5 cents.  
 Merk, an old Scotch coin, \$3.22.  
 Millrei, Portuguese silver coin, \$1.16.  
 Mina, an ancient money, about \$19.36.  
 Muhur, an East India gold coin, \$8.13.  
 Muidore, Portuguese gold coin, \$6.48; Brazil, \$4.92.  
 Napoleon, a gold coin, \$3.83.

SHEKEL OF SILVER.

Nusf, an Egyptian silver coin, 48 cents.  
 Nusfhk, Egyptian gold coin, about \$2.49.  
 Obolus, an ancient coin,  $2\frac{1}{2}$  cents.

Onikilik, Turkish coin, 89 cents; Onlik, 44 cents.

Onzia, a Naples coin, about \$2.48.  
 Ora, an old English coin worth about 32 cents.  
 Pagoda, a coin about \$1.67.  
 Para, Turkish money, 1-30th cent; in Egypt and Tripoli,  $\frac{1}{4}$  cent.  
 Pardo, a Goa silver coin about 60 cents.  
 Patca, Spanish coin, \$1.  
 Algerine piastre, 36

Paul, Italian money, 10 cents.  
 Pawl, a coin of Guinea, 6 cents.  
 Pendebad, Persian silver coin, 11 cents.  
 Pera, a small Turkish coin,  $\frac{1}{4}$  cent.  
 Pseta, a Spanish coin, about 20 cents.  
 Peso, a Spanish coin; a dollar; a piastre.

DEMI-SHEKEL OF COPPER.

Pezza, a Tuscan coin, about 95 cents.  
 Pfennig, Prussian money, 1-5th cent.  
 Piastre, a dollar in Spain or Italy; Turkey, 5 cents; Turkey, 12 cents.  
 Picayune,  $6\frac{1}{2}$  cents.  
 Pice, copper coin of India,  $\frac{1}{4}$  cent.

Pistareen, a silver coin, 19 cents.  
 Pistole, a gold coin, Sardinia, \$5.42; \$4.48.  
 Plack, an old Scotch coin, 25d cent.  
 Poltin, a Russian silver coin, about 38 cents.  
 Pound sterling, English, \$4.84.  
 Quan, Cochinchina, about 85 cents.  
 Quattrino, copper coin, 1 cent.

Quinto, Spanish money, about  $\frac{1}{2}$  cent.  
 Real, a Spanish coin, silver, 11 cents; 5 cents metal; Egyptian, 97 cents.  
 Ree, Rei, Rea, Portuguese money, 1-10th of a cent.  
 Rial, an old English coin of 10 shillings.  
 Rix dollar, a German coin, 75 cents to \$1.08.

able, an ancient gold coin, worth about \$1.  
 n Egyptian silver coin, about 25 cents.  
 Russian silver and gold coin, about 75 cents; paper  
 , 30 cents.

ANCIENT COIN MOULD AND DIE.

silver coin, 44½ cents; Malay, gold. \$7.27.  
 , Tuscan gold coin, \$6.92.  
 , Dutch coin, \$6.

CÆSAR AUGUSTUS, B.C. 27.

ran, a Persian silver coin, 22 cents.  
 Austria, 97 cents; Rome, \$1; Sardinia, \$1.22.  
 gold coin of France, 80 cents.

ANCIENT RING MONEY.

JULIUS CÆSAR.

Seni, Japanese money, 1-64th cent.  
 Sequin, a gold coin, Italian, \$2.29; Turkish, \$1.80; Egypt-  
 ian, \$1.25.

COIN OF ARCHELAUS.

COIN OF CLEOPATRA.

Sextans, Roman money, about 1/6th cent.  
 Shekel, silver, 62 cents; gold, \$8.75; weight, 9 1-5th penny-  
 weights.  
 Shilling, English shilling, 24 cents.  
 Soldi, Italian money, 1 cent.  
 Sharock, East India silver coin, 24 cents.  
 Spur-royal, an old gold coin, \$3.66.  
 Stiver, a Dutch coin, 2 cents.

SOTER, B.C. 162.

Stooter, Dutch silver coin, 5 cents.  
 Sultanin, a Turkish gold coin, \$2.42.  
 Tael, Chinese money, about \$1.40.

Tallero, Venetian coin, about 98 cents.  
 Taro, Naples silver coin, 8 cents.  
 Temin, Algiers money, 40 cents.  
 Tempo, Japanese, about 2 cents.  
 Teruncius, a Roman coin.  
 Tester, an old coin, about 12 cents.  
 Testoon, silver coin, Italian, about 30 cents; Portuguese, 14 cents.  
 Tetradrachma, silver coin, about 78 cents.  
 Thaler, a German dollar, about 72 cents.  
 Tical, a Siamese coin, about 60 cents; Chinese, \$1.61.  
 Token, money not coined by authority.  
 Toman, a Persian gold coin, \$2.25.  
 Tonga, a Bokhara silver coin, about 15 cents.  
 Triens, a Roman copper coin,  $\frac{1}{16}$ th of an ounce.  
 Tsien, Chinese money,  $\frac{1}{16}$ th of a cent.  
 Utchlik, a Tripoli coin, about 15 cents.  
 Vellou, Spanish money, about  $4\frac{1}{2}$  cents.  
 Vinten, Portuguese money, about 2 cents.  
 Yrmilik, a gold coin of Turkey, 87 cents; Egypt,  $9\frac{1}{2}$  cents.  
 Zloty, a Russian and Polish coin, about 11 cents.

**Temple of Apollo Pythias.**—Thinking the enclosed may not have come to the notice of the editor of *POTTER'S AMERICAN MONTHLY*, the writer takes the liberty of sending it to him, as the archaeological discovery fixes the site of the Temple of Apollo Pythias, before unknown. The clipping is as follows:

The Department of State at Washington is in receipt of a letter from General John Meredith Read, charge-d'affaires at Athens, reporting the discovery by Mr. Stephen Commanverdis, the learned Secretary of the Archaeological Society of Athens, of the monument mentioned by Thucydides as having been erected by Pisistratus, son of Hippias and grandson of the tyrant Pisistratus. The stone, which was lying neglected on the right bank of the Ilissus, southwest of the Temple of Jupiter Olympus, bears an inscription of which the following is the translation:

"THIS MONUMENT, UPON HIS ADVENT TO POWER, PISISTRATUS, THE SON OF HIPPIAS, HAS DEDICATED IN THE TEMPLE OF APOLLO PYTHIAS."

The discovery of this remarkable stone fixes the site of the Temple of Apollo Pythias, which was hitherto unknown. The monument has been purchased by the Archaeological Society, and will be immediately transferred to the Museum of Varvakion.

PHILANDER.

**What does it Commemorate?**—In the *NOTES AND QUERIES* department of your very interesting periodical I have frequently found most valuable information not obtainable elsewhere, and am therefore induced to ask through its columns (if the Editor will kindly permit) the many readers to whom it pays its monthly greetings, if any one can inform me in regard to the object of the "Pillar or Obelisk" in County of Elgin, Scotland, concerning which much has been written, but nothing so far as I know, that shows or tells what it commemorates.

SIDNEY W. FISHER.

We cheerfully give space for the above letter of inquiry, and join with Mr. Fisher in his desire for light pertaining to

OBELISK IN THE COUNTY OF ELGIN, SCOTLAND.

the Obelisk in Scotland. We are only able to state for the general information of the reader, that this pillar is supposed to have been erected some time during the tenth century, and must have been designed to perpetuate important historical events connected with the people living at that time, both of a civil and a warlike character. The carvings on the Pillar in the main, show figures and implements of war: the bow and the arrow, the sword and the shield. Our illustration may aid our correspondent, or the reader, in his search for facts, exhibiting as it does many peculiarities. The monument—if it can be called such—is carved on the two opposite sides, and has long been a subject of curiosity.—EDITOR.

**The Myth of England.**—One of our esteemed contributors, in sending us a short sketch of a somewhat mysterious character, writes: "As the new group of St. George and the Dragon over St. George's Hall, in Philadelphia, is a theme of no little interest, I thought perhaps it would be worth while to give the readers of POTTER'S AMERICAN MONTHLY the benefit of the enclosed scrap:"

The story of St. George the especial myth of England—as St. Martial is of France—the dragon-slayer's myth, is founded with a host of others, upon the scriptural allusions to St. Michael the foremost in the Christian hierarchy, in his conflict with the old serpent, runs as follows:

Near a city of Libya dwelt the dragon, a monster whose habitation was a pond, and whose rations were two sheep and a maiden per diem. When it came to the turn of Saba, the king's daughter, to be sacrificed, and the people demanded her death, the monarch refused to offer up his child. At this juncture St. George appeared and promised to help Saba in the name of his Lord Christ. He subdues the monster and delivers the girl, whereupon the king, his

daughter, and all his subjects were formally baptized. St. George being offered rich gifts, refuses all reward, he gives lavish alms to the poor, teaches the king his duty to God and his neighbor, and finally departs. Of course the myth resolves itself into the deeds of some public-spirited man who in a time of sore need has become a public benefactor, distinguishing himself in some time of pestilence or great calamity, by heroic deed on behalf of his suffering followers, then, while men's hearts were made tender by sorrow, has taught them great truths, baptizing them into a new faith, and leaving them a nobler and purer code to live by. Such is the history of George of Cappadicea.

MARGARET FIELD.

**A Long-Lived Family.**—A correspondent in Kentucky sends us the following: The recent death of Amos Turney, Sr., of Bourbon County, Kentucky, in the 78th year of his age, suggests this notice of his family.

Daniel Turney, who died in Bourbon County many years ago, aged 87 years, and his wife, Susan Turney, who deceased aged 55 years, were the parents of thirteen children, all of whom reached mature years. The one dying youngest was in his 55th year. The following are the names and ages of their children: Eva May Smizer, aged 64; Peter Turney, aged 54; Sallie Turney, aged 84; Judith Themister, aged 80; Anna Forsythe, aged 75; Rebecca Current, aged 81; Lydia Bowen, aged 69; John Turney, aged 56; Jesse Turney, aged 79; Amos Turney, aged 78; Morgan Turney, aged 71; Matthew Turney, aged 65; Katharine Morris, aged 74.

Parents and children aggregated 1,072 years, an average of about 72 years and 6 months. Two of the children are still living—Morgan Turney, aged 71, and Katharine Morris, aged 74.

W. W. F.

## CURRENT MEMORANDA.

**Trade with South America.**—Our people are always interested in any subject which has in view an increase of their exchequer, either in a national or individual point of view. Especially at this time, when there is general depression of all forms of industry, owing to the lack of confidence of capitalists, any scheme or project which seems plausible, is agitated and pretty thoroughly shaken up to see if "it will hold water." While there has been a general cry of "hard times" but few methods have been developed to ameliorate or improve our condition. At one time our troubles were all charged to a depreciated currency; we had either too much or too little: at another period, over-production was the source of evil. In time of general thrift we had overstocked not only our own market, but the markets of the world. Another observing mind had discovered that as war always destroys or consumes wealth, we have through the late war become a bankrupt nation. To our minds none of these are correct, but each embodies some truth. That which concerns us more than how we got into our embarrassment, is how to get out the easiest and quickest way. If our dwelling be on

fire, it is not the time to waste energies as to who set it on fire, but how to save the building and its contents.

To find markets for what we produce has been the desire of both manufacturers and general producers. There is certainly not much doubt but that such markets being once found and utilized, much of our distress would disappear. There are certainly channels enough in the markets of the world—human wants, necessities and tastes—to take from us all our surplus manufactures and set again in motion the wheels of industry, if we can only share fairly in supplying them. And why have we not long since turned our attention towards the Sunny South? We have not only wasted by war, but crippled by our domestic policy, those whom we should have aided. At least the ten years past, say from 1867 to 1877, could have brought forth plentiful harvest, if proper efforts towards conciliation had been put forth. The trade of the North with the South prior to the war, was one of the chief sources of our general prosperity. Merchants, manufacturers and shippers found in our Southern brethren good customers. The value of this large trade has apparently been

overlooked, while searching for reasons for the continued stagnation of business. The sooner this trade is put in motion, between these two sections of the country the better for the whole people.

The trade with South America is an item of considerable moment, and there is no good reason why we should not control a fair share at least of it. Add this trade to that of the Southern States, which capitalists can soon revive, and we will see the dawn of better times. The importance of early effort to develop the exportation of our manufactures to Brazil and Mexico is impressing itself more every day upon our merchants. Mr. Randall, the ex-Speaker, has written a letter to some leading citizens of Galveston, Texas, in reply to an invitation to visit them, in which he points out that, while the total foreign trade of the countries lying south of the United States on this continent amounts to about \$520,000,000, our share of it is only \$112,000,000, and of this only \$37,000,000 is carried on under the American flag.

What we need to mend matters is, he says, "more favorable commercial relations and more comprehensive trade connections with other nations;" and he adds "that the policy of the Government should be to enlarge our trade relations with Mexico and with the Central and South American States," and he afterwards speaks of this as "an extended policy." The difficulty which afflicts the trade of this country with South America is the one which afflicts our trade with all foreign countries. We have so arranged our system of taxation that it costs us more to produce commodities than foreigners are willing to pay for them, and consequently we have to pay for what they sell to us largely in gold, and they cannot afford to take gold. South Americans, like other rational people, go to the market where they exchange their own goods to the best advantage for other people's goods.

The New York *World* gives an interesting compilation of facts and figures, showing what an inviting field is here offered for American enterprise. The latest figures obtainable, those for 1874, show that while the United States sold to Mexico and South American countries twenty-eight millions of goods, France sold twice and England four times as much. And yet the United States, during the same time, imported seventy-five millions of various goods from these countries. Mexico, Brazil and Chili need just what we want to sell. They have no manufactures, but their tropical soil gives the husbandmen abundant returns. They bought in one year 475,000,000 yards of cotton cloths, of which England furnished fourteen-fifteenths, though from one to two thousand miles further away than the United States. And yet we can sell cotton to advantage in Manchester; we do send cotton to Manchester, 2,500 miles and let Manchester send cotton back to Brazil, 5,000 miles. These countries use thirty millions' worth of machinery every year, which we manufacture as cheap and better than England. Finally, a steamer leaves Liverpool almost daily for South American ports, while the United States has not one regular line, though two firms, one in New York and one in Boston, have four steamers running at irregular intervals.

There was talk last fall about a line between Brazil and Philadelphia. Now New York is being aroused to the possibilities of such a commercial relation, and at the next

session of Congress there are likely to be at least two lines asking for a mail contract. The advantage in port charges and rail connections are such that a line from this city can be made to pay larger profits than a line from New York. Many articles for which there is a ready market in South America are manufactured in this city, and through freight rates to or from any part of the country can be made always as low at this port, and sometimes lower. To do this trade is impossible without steamships at stated periods, but with them it will be necessary for our merchants to send out their agents and to make especial effort for the sale of their goods, because in many of the large ports even there are no houses who have any trade with American ports. The Fall River manufacturers, finding no market at all for their goods at home, sent an agent to Brazil who prospected the country, and immediately on his return looms were changed, and already the demand is sufficient to take all their surplus product. Nor is there any trouble about a return cargo. If the supply of cotton, hides or India rubber fails there is always a paying freight to be had by taking cabinet woods.

**Making History.**—Just as we go to press with this number of the MONTHLY, our mind reverts to the HISTORY made since our last issue. "Time and tide wait not," is none the less true because an old saying. Most certainly events crowd rapidly after their forerunners, and stamp their undying imprints upon the pages of history. The record goes on as unceasingly as the flow of the waters of the mighty Mississippi, nor night nor day does it pause in its chronicling of that history. This record is either one of shame or of honor, whether applied to national or individual life. It is an exhibit of either progression or retrogression—an advance forward or a step backward in some one of the countless interests which relate to human weal or human woe. Neutral life is a non-entity—a myth belonging only to imagination. All animated forms of creation show growth or decay, from the most delicate plant in the valley up to the most honored king on his lofty throne. We gladly record some of these events in this outgoing number of the AMERICAN MONTHLY, and none with a greater degree of satisfaction than those which tell of THE NATION'S ADVANCE.

Without ostentation, or desire for display, President Hayes moves majestically towards a higher life for the nation. The fiat went forth from the White House on June 22d, having in it the true ring of reform. Theories, pledges, and promises are all well enough at times, but when a grand principle is brought forth into life, having in view the saving of our republican form of government, it must enable the people representing that government to breathe easier. That decree was, and that principle is, that THE BUSINESS OF THE GOVERNMENT AND THE POLITICS OF THE OFFICE-HOLDERS UNDER THAT GOVERNMENT, OUGHT TO AND SHALL BE INVOICED. That proclamation, if not in words, in spirit, of Rutherford B. Hayes, will live long after he shall have laid down the cares of office. No wonder that it produced a perfect tornado of abuse from wire-pullers and tricksters, in office and out of office. DIVORCE BUSINESS FROM POLITICS! Four words big with meaning, and wide-spread in their operations. They say, corruption in office shall take place no longer. They lift the ominous clouds hanging over the nation's destiny.

This order, too, goes directly home to every office-holder in the United States. We here give it in full:

EXECUTIVE MANSION, WASHINGTON, June 22.

SIR: I desire to call your attention to the following paragraph in the letter addressed by me to the Secretary of the Treasury on the conduct to be observed by officers of the General Government in relation to the elections: "No officer should be required or permitted to take part in the management of political organizations, caucuses, conventions or election campaigns. Their right to vote and to express their views on public questions either orally or through the press is not denied: provided it does not interfere with the discharge of their official duties. No assessments for political purposes on officers or subordinates should be allowed." This rule is applicable to every department of the civil service. It should be understood by every officer of the General Government that he is expected to conform his conduct to its requirements. Very respectfully, R. B. HAYES.

Our late national contest came near wrecking the great ship of State, through the machinations of office-holders and political organizations under their control. When a Secretary of War, and other influential members of the Cabinet, standing at the head of a great political body, can use the military to coerce decisions at the ballot-box, it is high time the people rise in their might and hurl from power those subverters of one of the best forms of a government in the world. The old cry, "impracticable!" is heard from those who have been too long fed from the public crib, to the public detriment. "Impolitic! it will destroy the Republican party," sing out another class of barnacles, who have for many years impeded the sailing of the old Ship of State. Reform, to be effective, must go to the bottom of the evil, and remedies as radical as the disease itself must be administered. The best elements in both parties say amen! to this, as they will to every measure which the President adopts to purify the civil service. "He serves his party best, who serves his country best," is an expression which does its author honor. The true idea of government is "the greatest good to the greatest number," and this is the principle involved in the separation of the two conflicting interests, business and politics. That the patriotic spirit of the masses is kindled, as with a new life, by this move by the Executive, we need only to witness the ratifications made manifest both North and South. New England's heart ratifies the reform measure. This is shown in emphatic style by the warm reception given the President during his recent tour.

RETRENCHMENT.—In harmony with this, we see the several members of the Cabinet instituting changes calculated to retrench the expenses of the Government, while augmenting the national credit. The Secretary of the Treasury is successfully negotiating the sale of our bonds at the low rate of four and four and one-half per cent. This, as compared with former rates, will save from one and a half to three per cent. on so much of the national debt. In this connection we give Mr. Sherman's letter explanatory of the mode and material in which the new loan is to be paid. The letter is as follows:

TREASURY DEPARTMENT, WASHINGTON, June 19, 1877.

Francis O. French, Esq., No. 94 Broadway, New York:

SIR: Your letter of the 18th inst., in which you inquire whether the four-per-cent. bonds now being sold by the Gov-

ernment are payable, principal and interest, in gold coin, is received. The subject, from its great importance, has demanded and received careful consideration. Under laws now in force, there is no coin issued or issuable in which the principle of the four-per-cent. bonds is redeemable or the interest payable except the gold coins of the United States of the standard value fixed by the laws in force on the 14th of July, 1870, when the bonds were authorized. The Government exacts in exchange for these bonds payment at their face in such gold coin, and it is not to be anticipated that any future legislation of Congress, or any action of any department of the Government, would sanction or tolerate the redemption of the principal of these bonds, or the payment of the interest thereon in coin of less value than the coin authorized by law at the time of the issue of the bonds, being the coin exacted by the Government in exchange for the same. The essential element of good faith in preserving the equality in value between the coinage in which the Government receives and that in which it pays these bonds, will be sacredly observed by the Government and the people of the United States, whatever may be the system of coinage which the general policy of the nation may at any time adopt. This principle is impressed upon the text of the law of July 14, 1870, under which the four-per-cent. bonds are issued, and requires, in the opinion of the Executive Department of the Government, the redemption of these bonds, and the payment of their interest in coin of equal value with that which the Government received upon their issue.

Very respectfully,

JOHN SHERMAN, Secretary.

This letter is pregnant with interest to our creditors at home and abroad. We believe Mr. Sherman's policy of thus funding the public debt is deserving of general approbation.

THE NATION'S HONOR GUARDED.—Mr. Evarts, our able Secretary of State, keeps pace with the ideas of national protection of American citizens, whether on our border or on the other side of the Atlantic. The recent seizure of the schooner *Rizpah* by a Spanish cruiser, resulted in diplomatic correspondence between our own and the Spanish Government. The essence of the controversy is shown in the following, taken from the *National Republican*:

"Early in June the American whaling schooner *Ellen Rizpah*, Captain Dunham, of Provincetown, Mass., was boarded by a Spanish cruiser while on the Keys south of Cuba, and her papers called for. The latter were produced, but not being deemed satisfactory to the commander of the cruiser, the schooner was seized and the captain arrested and placed in close confinement. At the expiration of four days a Spanish frigate arrived, and after consultation the schooner and captain were released.

The foregoing were the facts as related by Captain Dunham upon his arrival at Key West, which were forthwith communicated to the Government. Secretary Evarts immediately took steps to investigate the matter, and at his request Colonel Frank Wicker, Collector at Key West, was directed by telegraph to dispatch the revenue steamer *Crawford* in search of the *Ellen Rizpah*, and obtain from Captain Dunham a sworn statement of the circumstances attending the outrage alleged to have been perpetrated by the Spanish

cruiser. The cutter started in search of the schooner, but did not succeed in finding her. Secretary Evarts, however, addressed a note to the Spanish Government, calling its attention to the facts as they had been received at the State Department, which, if true, were such as the United States could not tolerate, and would require the fullest and most ample satisfaction.

The tone of the Secretary of State's communication must have been regarded as an unsavory novelty at Madrid, and doubtless convinced the Spanish Ministry that the day was over for gratuitous indignities to our flag, and that hereafter Spain will be held to a strict accountability for all outrages perpetrated upon our citizens by its officials, in Cuba or elsewhere. The reply of the Spanish Government, recently received at the State Department, assures Mr. Evarts that Spain will make all honorable amends for the seizure and detention of the schooner in question and the imprisonment of Captain Dunham just as soon as an investigation of the facts can be had, and promises that it will spare no efforts to prevent a repetition of similar outrages in the future. Mr. Evarts will hand in his bill of damages against Spain when he receives Captain Dunham's sworn statement."

**A REHABILITATED SOUTH.**—In concord with the protection of American rights abroad, we see the most gratifying evidences of better times in the Southern States. Confidence is rapidly taking the place of distrust; and the demoralization of knaves and thieves points to light and happiness in the near future.

The wisdom—not to say the right—of allowing the citizens of each State to manage their own affairs in time of peace, is daily being demonstrated. The President may rest satisfied with his "well-done" in the formerly distracted States.

**LET JUSTICE TRIUMPH.**—Our hope now is that the legal measures recently instituted against members of the late Returning Boards will bring to the full light of day all acts and their authors which militated against the sacredness and purity of the ballot-box. It matters not who suffers, so long as Justice is crowned victor. The gaze and condemnation of the whole world on those who betrayed such holy trusts, cannot be too severe as a lesson for the future. We cannot afford to make treaty with evil doers, no matter what social or political station they occupy. This last remark is called out in view of statements in the representative journals of the day to the effect that "an indictment of the members of the Louisiana Returning Board by the New Orleans grand jury, is a violation of the plighted faith of the Nicholls government." The idea here is that certain conditions and guarantees being made by the present State Government, resistance to its claim would be withdrawn; and among these conditions were the suppression of evidences of fraud and protection of the guilty. Such appears to be the meaning of babblings near the fountains of power. Judge Lawrence, of Illinois, gives expression to this idea as "a gross violation of pledges by the Nicholls government," and that in an apparently official way. This certainly is a startling confession by one of the leading members of the Commission. The people cannot afford to compound crimes of such a character, and we feel sure that the voice of the nation will call for the whole truth.

**OUR RELATIONS WITH MEXICO.**—Extending our obser-

vations further south, we see still agitations going on the borders of Texas and Mexico. The frequent incursions of Mexican outlaws into our domain, and thefts and murder committed by banditti bands, have compelled our government to despatch military protection against such invasion of the rights of American citizens; and as the government of Mexico appears powerless to control these desperadoes, orders have been given to General Ord to pursue, if necessary, these bands into Mexican territory. This policy, it is not claimed, is sanctioned by law, but is our only remedy. Self defence is certainly one of the first laws of nature, and retaliation on the part of individual citizens would seem justifiable; it is a question, however, whether such an act of the government as ordering the United States forces to cross the Rio Grande is justifiable, prior to further efforts with the Mexican government in search of redress. It seems to us premature; but not as much so as the recognition of the Diaz government, through Senor Matta, the accredited Minister from Mexico. It is also announced from high authority that the Diaz government has made arrangements to pay all the just claims of Americans who lost their property in the mining country.

**THE ISSUES IN FRANCE** are not yet settled, and it is difficult to foresee the termination. In the French Chamber of Deputies the debate on the interpellation was recently resumed.

The principal speech was made by M. Leon Renault, former Prefect of Police, who addressed the House in the name of the Left Centre and all Conservatives who on grounds of reason had rallied to the Republic. In vehement but persuasive language he demonstrated the impossibility of turning backward and restoring the monarchy. The present Cabinet would ruin the Marshal as Polignac had ruined Charles X., and simply pave the way for the triumph of the Bonapartists. The Count de Choiseul then presented the following order of the day in behalf of the United Left:

*Whereas*, The Ministry formed May 7 under the Presidency of the Duke de Broglie was called to the direction of public affairs contrary to the law of the majority, which is the leading principle of parliamentary government, and has since assuming office avoided giving explanations to the national representatives; *whereas*, it has besought the administration to crush universal suffrage by all the means at its disposal; *whereas*, it represents merely a coalition of monarchists guided by inspirations from the clerical party; *whereas*, it has allowed attacks on national representatives and incitements to violation of law to pass unpunished; *whereas*, on all these grounds it imperils peace and order, and disturbs business and general interests; *therefore*, the House declares that the Ministry does not possess the confidence of the nation.

On the conclusion of the reading of this order, there was much excitement and cheering. Ministers left their seats only to increase the applause and general confusion.

**THE CROSS AND THE CRESCENT** struggle warms warmer from day to day, and while Russia has met with reverses in Northern Asiatic Turkey, there are only accumulating evidence that she proposes to occupy Constantinople. Plucky little Greece has resolved to be neutral, and give the Turks

no special advantage. Austria approves the course taken by the Greek Government in detaining Turkish arms at Corfu. It is proposed that an Austrian steamer be allowed to take them to some neutral port. This Greece will agree to, provided the Austrian Consul gives a written guarantee as to their destination.

It is most gratifying to notice that amid the alarms and realities of war, the Emperor of Russia, whose emancipation of the serfs will carry his name with honor through the future ages, is steadily proceeding with measures for ameliorating the condition of the numerous races who acknowledge him as lord, and is forwarding by all means in his power (chiefly governmental assistance and pecuniary aid) the establishment of a university in Siberia, so long previously known as a penal settlement. As far back as 1803 a rich Ouralian (or Uralian) land-owner paid 100,000 rubles into the Treasury, to be applied to this purpose. This has swollen to 150,000, to which a Siberian merchant lately added 100,000 rubles more. Omsk, which has superseded Tobolsk as the capital of Western Siberia, and which has long been the seat of a military academy, is the place chosen for the future seat of learning, as it is not far remote from the scholastic arrondissements of Orenburg and Turkestan, and does not contain a single political prisoner. The buildings are already being constructed, and the intention is to have them ready for occupation by July, 1880. The whole expense of "running" this Siberian university, including the salaries of the professional staff, is estimated at \$214,900 a year. The system adopted will resemble that of the American rather than the English universities.

THAT THE NATIONAL ANNIVERSARY was generally observed throughout the country on the Fourth of July speaks well for the patriotism of the people and permanency of republican institutions. The demonstrations were not so boisterous as usual, but they all showed that the birth of the FIRST YEAR in the SECOND CENTURY of the Republic was duly recognized. The day itself was remarkably fine, just sufficiently cool to brace up the system and enable pedestrians, orators and others to accomplish whatever they had in view. Among the many commendable speeches of the day we find none more significant than Colonel Forney's, of Philadelphia. It discusses national topics in a most vigorous way. We extract the following as comprehending the issues of the hour:

"But we seem to have approached solid ground within the last six months. Two of the greatest European nations have exploded into a war, which threatens to extend far and wide in the Old World, but here all is peace, or the assurance of peace. A wise administration of the General Government bravely presses for the restoration of tranquility between recently divided States. . . . .

It is true these bright signs are followed by a protracted business depression. But even this depression is not without its uses. It compels a severe and resolute self-examination. It enforces the correction of social and individual mistakes. It imposes upon government and people a rigid frugality and economy. The government cannot shrink from its duty while the people suffer; and the masses will not complain if their public servants follow their example. The office-holder must work for his money, like the unofficial

tax-payer. Competency must be the test in public, as it is in private business. There can be no privileged class in a republic. There can be no families quartered on the treasury. The citizen in office neither becomes the master of the citizen not in office nor yet his slave. He is to be paid for his work, not for his political skill. The experience of the last forty years was hard enough in both parties; but the expensive and dangerous excesses since the war became insufferable.

A new departure was inevitable. It could not be postponed without private and general bankruptcy. A great man came in time as the instrument of Reform. Providence sent us the warning, and also the deliverer. God give him strength to persevere, and woe to those who attempt to chain his hands and to defeat his great mission. The clouds still hang heavily over our country, not only ours alone, but over all the interests of labor abroad. Yet I can see the silver lining growing broader and brighter."

**Constantinople.**—At this particular time in the world's history no one place on the map of the Eastern Continent commands more attention than Constantinople, the capital of Turkey. The interest converging at this point is not so much with the masses as with the crowned heads, as it is regarded strategically and politically in its relations to other powers somewhat in the same sense as the keystone is to the arch of the temple. While Russia and Turkey are the powers in direct conflict, with all the destructive implements of warfare, the other nations are more than merely interested observers; they are passing through the more active forms of diplomatic correspondence, in order that there shall be brought about a mutual understanding with each other, that their respective interests shall be protected. To Russia they say, "thus far and no farther shalt thou go;" and Russia gives assurance that should she take possession of Constantinople, she will hold it only long enough to get indemnity and guarantees. Under these pledges, it is more than likely, from the outlook at this writing, that England will keep "hands off," at least for the present. The subject, however, is a complicated one, and it would not greatly surprise us to hear of other Powers stepping in for their share of the Turkey.

It may interest our readers, especially those who have not had the opportunity of visiting Constantinople, to give here an outline of it. On landing at this seat of Empire, the feeling experienced by the traveller is generally one of disappointment. The magnificent view of the city obtained from the deck of a steamer entering the Golden Horn, either from the Marmora or the Bosphorus, gives rise to anticipations, which, alas! are destined never to be fulfilled. The belt of Constantinople proper is about fourteen miles. The city is enclosed by walls on the land or western side. On the north is the famous "Harbor," or Golden Horn, which separates it from Galata, and the Bosphorus divides it from Scutari. These are the outlying, or more properly, suburbs, but are included in the general make-up of the city. Difficult, indeed, would it be to find a site better adapted for the Imperial City. Apparently nothing is wanting; and it is not at all remarkable that the eyes of the world are now and then turned toward it. The population of the city is near a half million, composed of a variety of congruous and incongruous elements

Armenians, Arabs, Greeks, Europeans, and Turks; the last mentioned (Turks) representing fully one-half of the population. It is probably unnecessary to state that the city occupies the site of ancient Byzantium, founded 667 B.C.

From its foundation until the time when Constantine made it the seat of power, it had a varied history, usually falling into the hands and among the most successful of the Greeks. In A.D. 329 arrangements were made for the great change, and in May, 330, the new capital was formally inaugurated. The city rapidly grew in size and splendor; and when, in 396, it was declared the capital of the Eastern empire, it rose into great magnificence.

The Moslem divides his day and night into twenty-four hours, it is true, but his days begin with the sunset. An hour after sunset is one o'clock. It is at sunset that the "call to prayer" is made from the galleries of the mosque minarets, and not at any one stated or set hour, and is thus made not a little significant. The absence of churches and clocks, therefore, must make the city strange, if nothing else did so. Then there is—what, indeed, was to be expected—the narrowness

and tortuous character of the streets and ways, where anything in the way of plan or arrangement never could have crossed the minds of those who built the houses or dwellings which line them. They can only be compared to the irregular way across an uneven field, with cottages built close to the edge of it, as the traffic got year by year to be thicker and thicker. Each street of the city is a perfect zigzag, and a straight line is not to be found. Indeed, there is a total absence of "planning" in any sense. From east to west the city is about three miles and a half, while from north to south it is about three miles.

It is the residence of the Greek Patriarch, who holds his patriarchal synod here; and the Armenian Patriarch and the Greek Catholic Bishop have their homes in Constantinople. The Protestant churches of Britain and America have their missionary headquarters also here. During the thirteenth century the Genoese and the Venetians by their commerce retarded its prosperity, and in 1543 it fell before the power of the Turks, who besieged it for forty days. Since then it has remained in Moslem hands.

## LITERATURE AND ART.

**Representation.**—Creations of ART, as distinguished from works of NATURE, are objects of so much diverse criticism by both sexes, equally familiar perhaps with the productions of those men and women who have given to the world the best efforts of a life-time, that it may compensate us for the time and labor spent, if we investigate the causes of this contrariety or diversity of opinions. It is recorded of a certain work of art, which illustrates our thoughts, that on its being placed conspicuously in a public hall on exhibition, a written request was put over it as follows: "Every one who examines this painting and sees in it any imperfection, will please mark with pencil on the canvas itself the localities of each defect or mistake of the artist." Multitudes went to see the painting and pass judgment upon it, and among them many of the best art-critics of the day. One after another expressed his disapprobation of this part, that color, and yonder design, by making on each spot a cross sign of his criticism. The picture had been on exhibition scarcely three months when its whole beauty was marred and disfigured by the unfavorable marks of spectators. Judging from this seemingly general condemnation, it was pronounced by the press a failure, and its author a botch. Public opinion seemed to fully ratify that of the press, and those indicated by the crosses. The result of such disfavor induced the withdrawal of the painting from the public gaze. A few weeks subsequently the same picture was again put on exhibition in the same hall, with a card upon it as follows: "Your sign of approval of this painting is requested by a mark on each particular place of beauty or grandeur as may really deserve it." Hundreds gathered before the result of the labors of the pains-taking artist to again record their judgment of the work. One sign was followed by another until, as before, the entire canvas was studded, like the heavens on a clear night, with stars of the people's approval.

The heart of the artist was warmed as with a new life, and his future pathway to success and renown was illumined by this host of constellations on his ideal creation.

How truthfully and forcibly this story typifies the diversity of human judgment. It but faintly unfolds, however, the causes. These are multiform, and can only be fully understood by probing the inner elements, faculties and functions of human life. Criticism grows out of inherited, cultivated, or trained powers. These powers may be noted by various characteristics. A taste for the moral and æsthetic may predominate with one person, while physical grandeur, strength and boldness may mark the love of another. We see the more strictly intellectual taste almost, if not entirely, isolated from the emotional nature. Sometimes a strong light is thrown upon a subject by the relation or position it holds to other topics. Hence, taste has a philosophical side to it. Some writers even advance the idea that taste is never emotional. With this we do not agree; for daily ocular evidence compels us to acknowledge that our tastes and judgment are measurably controlled by our feelings or emotions on beholding certain objects. They excite sympathy or disgust, according as they bear upon our sensitive and emotional nature. They may say that decisions which are influenced by the heart are biased or partial. In some sense this is certainly true; but when the cold and matured intellectual judgment is in harmony with the heart promptings, it generally is broad and impartial. Taste is only in a degree an original power, distinct from other powers; it appears rather as a combination of several powers. Our conceptions of the good, the true, the beautiful, the majestic, and the sublime have their springs in several localities. The judgment is twisted and warped through the forces of education, customs of society, conditions of the body, or circumstances surrounding its possessor. Blessed, indeed, is he who can cut himself

printed by the hand of the editor and his sister. Of course there was but one copy of this sheet in an edition. Mrs. Broderip thinks that if Tom's talent for drawing had been cultivated he would have made a fair water colorist and a capital designer on wood. He did do some wood-drawing occasionally, and illustrated several children's books. Hood received a university education, and it was at one time decided to make a clergyman of him; but this was given up, as his tastes and leadings were all the other way. He actually did write a sermon or two, which are still in existence. He learned the practical workings of a newspaper office on the

He was a baby first, and then  
He was his parents' joy;  
But was a man soon after, when  
He ceased to be a boy.

And when he got to middle life,  
To marry was his whim;  
The selfsame day he took a wife  
Some woman wedded him.

None saw him to the other side  
Of Styx, by Charon ferried;  
But 'tis conjectured that he died,  
Because he has been buried.

WOMEN WITH DISTAFFS.

(See page 155.)

Liskeard *Gazette*, in Cornwall. He was among the early contributors to the *Cornhill Magazine*, when Thackeray was at the helm, and of him that great man said: "He is one of the most promising of the young birds who flutter around our *Cornhill*." Hood filled a temporary clerkship at the War Office at one time, spending his days at his desk and his nights in writing for the magazines. He soon gave up the War office and turned his peaceful thoughts to literature, editing and writing, until he finally became editor of *Fun*, a position he held to the day of his death. One becomes very much interested in this son of a great man, who, if not a great man himself, was a genial gentleman and a clever humorist. We give below specimens of his humorous and serious verses. The first is called "A History:"

There was a man, so legend says,  
And he, how strange to tell!  
Was born upon the very day  
Whereon his birthday fell.

This is very suggestive of the father. The following called "If!" is wholly his own:

Ah, dearest, if our tears were shed  
Only for our beloved dead;  
Although our life's left incomplete,  
Tears would not be so bitter sweet,  
As now! ah! no.

Ah, dearest, if the friends who die,  
Alone were those who make us sigh;  
Although life's current is so fleet,  
Sighs would not be so weary, sweet,  
As now! ah! no.

If oft man pain it did not give  
To know that our beloved live,  
Than learn their hearts has ceased to beat,  
Grief would not be so hopeless, sweet,  
As now! ah! no.

We must confess to a preference for this poet's humor-verse, although the foregoing is very pretty. Mr. Hood

CORN AT SYRIA.

(See page 155.)

disfortune to be born the son of a famous man. Great expectations were expected of him from his cradle, and comparisons suggested to his grave. In all probability if his name had been Tom Hood it would have brought him more success. His reputation, however, was very pleasant and easily won. We cannot help calling attention to the cover of the book, which is as beautiful as it is unique.

In speaking of authors, our attention is called to a very pretty contribution to the current literature of the day, by John G. Whittier. There is peculiar interest in the lines, as they cast a certain halo over and around the statue of Fritz Halleck, recently unveiled in Central Park, New York. Our readers will no doubt appreciate them:

Among their graven shapes to whom  
Thy civic wreaths belong,  
O! city of his love, make room  
For one whose gift was song;  
Not his the soldier's sword to wield,  
Nor his the helm of state,  
Nor glory of the stricken field,  
Nor triumph of debate.  
In common ways, with common men,  
He served his race and time  
As well as if his clerkly pen  
Had never danced to rhyme.  
If, in the thronged and noisy mart,  
The Muses found their son,  
Could any say his tuneful art  
A duty left undone?  
He toiled and sang; and year by year  
Men found their homes more sweet,  
And through a tenderer atmosphere  
Looked down the brick-walled street.

The Greek's wild onset Wall street knew,  
The Red King walked Broadway,  
And Alnwick Castle's roses blew  
From Palisades to Bay.

Fair City by the Sea! upraise  
His veil with reverent hands;  
And mingle with thy own the praise  
And pride of other lands.

Let Greece his fiery lyric breathe  
Above her hero-urns;  
And Scotland, with her holly, wreath  
The flower he culled for Burns.

O, stately stand thy palace walls,  
Thy tall ships ride the seas;  
To-day the poet's name recalls  
A prouder thought than these.

Not less thy pulse of trade shall beat,  
Nor less thy tall fleets swim,  
That shaded square and dusty street  
Are classic ground through him:

Alive, he loved, like all who sing,  
The echoes of his song;  
Too late the tardy meed we bring,  
The praise delayed so long.

Too late, alas! Of all who knew  
The living man, to-day,  
Before his unveiled face, how few  
Make bare their locks of gray!

Our lips of praise must soon be done,  
Our grateful eyes be dim;  
O, brothers of the days to come,  
Take tender charge of him!

New hands the wires of song may sweep,  
New voices challenge fame;  
But let no moss of years o'er-creep  
The lines of Halleck's name.

**Johnson's New Universal Cyclopædia, a Scientific and Popular Treasury of Knowledge**, Edited by President Barnard, of Columbia College, New York, and Professor Guyon, of the College of New Jersey, and many other associate writers, is just completed with the fourth volume. This last volume contains 1760 octavo pages, and embodies subjects from the letter "S" to "Z" inclusive. The appendix contains valuable articles too late for insertion in alphabetical order. The plans, maps, and engravings are numerous, and all show good taste and care in their execution. The critics generally speak of this "Treasury of Knowledge" in a complimentary manner, and bespeak for it a favorable reception. In speaking of the origin of the work, the editors-in-chief say, that the idea of its publication belongs to that most remarkable journalist of his time, Horace Greeley, he believing that there was a growing need of such a Cyclopædia. The fact that Zell's work of a similar character has obtained a large sale, would seem to demonstrate the appreciation of the public of knowledge in such systematic form. Considerable competition will naturally arise between Appleton's, Chamber's Zell's and this—Johnson's elaborate work—but it can only prove a healthy agitation, tending to disseminate the general spread of knowledge.

## SCIENCE AND MECHANICS.

**Our Manufactures at Paris.**—Our department of manufactures at the Centennial opened wider the eyes of foreign nations than any other branch of the nation's exhibits. Especially in machinery and agricultural implements were we strong; and the ingenuity and industry which were crystallized in the many useful inventions made a deeper and more lasting impression on the minds of visitors from abroad than all other things combined, although our wonderful resources of soil, variety of climate, etc., commanded favorable consideration. The remark has been made recently that England was put at a disadvantage in Philadelphia on account of the Americans being at home, while she could not bring so far a fair exhibit of her manufacturing strength.

These remarks are called out in view of the approaching show at Paris. Let us there show the manufacturers of the United Kingdom that the United States have not made any retrograde movements since 1876. The *London Times* says: "The competition at Philadelphia was not altogether satisfactory to us. It is true that every nation has an advantage in exhibitions held within its own area; but the products of the industry of the United States surpassed our own oftener than can be explained by this circumstance. It appeared as if there was a greater economy of labor habitually practiced in the States, and in conjunction with this there was evidence of the more constant presence of a presiding mind superintending every process of industry. The best machine in the world will fail to give satisfaction if there is not an intelligent human being at hand to watch it, to take care of it, to detect the smallest failure in its working as soon as it is developed, and to suggest and supply the means of correcting any misarrangement of its functions.

A steam engine dropped from heaven in the middle of Africa might be adored, but it could not be put to any use. The failure of many of our industrial enterprises in foreign parts can be traced to the difficulty in procuring agents and assistants that can be taught to use the machines committed to their care.

Much of the mechanical work shown at Philadelphia was executed with a fineness that could not have been exceeded if every man who had any share in its production had originally conceived it, and had been solely interested in its success. There was evidence of personal care and personal anxiety. Every stage must have been watched with intelligence and with zeal. In comparing the results with our own, we are painfully suspicious that they revealed the application of more brains than we always have at our command."

**Memory as a Subject of Science.**—There are so many strange, and I might say, mysterious things connected with the MEMORY, that have never been explained to my satisfaction, and knowing how accommodating the Editor of PORTER'S AMERICAN MONTHLY has been to the anxious inquirer, the undersigned would ask the favor, if possible, of some solution to these mental phenomena. Some persons readily remember figures, but not names of persons; others can call

at once the name of any one to whom they have before been introduced. Again, there are individuals whose memories are prodigious as regards dates and historical events, but who have no retentive power worth speaking of concerning what they read if the subjects relate to Literature, Science, or Art. We have instances, again, of *ready memories*; those which instantly enable their possessors to give names, dates, or circumstances connected with any event or transaction. Some men memorize readily and retain easily what they once learn; others are able to retain what they see or hear only with great labor and difficulty. There are characters noted chiefly for their ability to tell a story, especially if it be of a *humorous* nature, while the same individuals are totally incapable of repeating historical matter, or that which is dry or *serious*.

E. V. HULL.

We fully agree with our INQUIRER as to that faculty known as MEMORY being a mysterious one in its operations and manifestations. Indeed, the *whole* mind of man is a marvel to us benighted creatures.

No part of man's organism is more complex than that which has to do with gaining knowledge. Phrenologists speak of MEMORY or EVENTUALITY as a faculty capable of cultivation, that is, of growth and development, if properly trained and nourished, and that the reverse results follow neglect and abuse of the faculty. We do not dissent from this idea, and know from observation and experience that it is possible to discipline and expand this power, and account, in that way, for many of the differences which exist between people as regards Memory. We know also, that were we to take two persons of about equal ability, of equal age, with similar surroundings and influences, and give them the same training, say for one year, the result would not be the same. One would excel the other in one or more particulars, and prove unequal in others. Causes for this difference might be many, and perhaps no less varied; among them, perchance, and even probable, natural temperament, quality and character of inherited blood, or some marked characteristics of the ancestral stock, either on the father's or the mother's side. The physical constitution, in both its present and normal state, most certainly deserves consideration when looking up causes of this memory phenomenon. It must not be understood that when we use the word *recollect* we signify the same thing as *remember*. We explain the distinction so as to be the more clearly understood. According to one authority, to *recollect*, is to call up or before the mind that which we *before* knew, while to *remember* is to fix upon the mind something which had been *forgotten*, or *never* yet known; recollect signifying the gathering up that which before was scattered. Words are so frequently misused that we are compelled to be constantly on the guard, especially when treating of a subject belonging to philosophy or mental science. Most of our knowledge is retained by the law of association, i. e., by linking the fact or event with or to some particular person, location, or circumstance. By Upham, a

writer on mental philosophy, this is called "circumstantial memory, or that species of memory which is based on the relation of contiguity in time and place." The inherent constitution of the mind coins, as it were, its own circulating medium, according to patterns or dies furnished by nature. The material or composition of this coin, of course, is furnished from the external material world, but shaped, stamped, and preserved in a large degree according to natural laws. To elucidate more fully our views, we would classify the forms which memory assumes. We, on investigation, recognize such a thing as, 1. A Philosophic Memory, sustained chiefly by resemblance, contrast, cause and effect. 2. Circumstantial Memory, which leans mostly upon minute particulars or com-

binations. 3. Intentional Memory, growing out of force of will or will-power. Now, in about the same ratio as the mind is methodical, systematic, and orderly, or the opposite, will be the growth towards the PHILOSOPHIC and logical, or in the direction of the CIRCUMSTANTIAL. As associations are not always voluntary, so likewise a remembrance of events is not a matter entirely of our own volition. Impressions of a permanent nature are at times even reluctantly fastened upon the memory, and we fain would obliterate them if possible. We might here extend the discussion of this very interesting subject *ad libitum*, but want of space compels us to contract our remarks. The more curious and odd feats of the memory will receive attention some other time.

## GOSSIP AND NOTE BOOK.

**Beautiful Women.**—We find considerable space devoted to the subject of BEAUTIFUL WOMEN, in the weekly and monthly periodicals of the day, and it is remarkable how much nonsense is mixed into the various descriptions of female beauty. One writer takes as his ideal of beauty the Roman, another the German, and a third the Italian, while from different pairs of eyes, the French, the Russian, and even the Chinese women possess the largest number of nature's gifts, which constitute, in the aggregate, beauty. In our opinion, beauty in man or in woman is so much the creation of fancy, or the coming up to one's own self-conceived and created ideas of what elements or physical signs make beauty, that it would almost appear a work of "love's labor lost" to attempt to set up before the public eye, either through the medium of the press, or in the living reality, what to one mind or pair of eyes is the highest form or essence of female beauty. Muscular development and power, to the devotee of muscular charms, wherever found remarkable, would seem beautiful. To him who regards the eyes as the chief of charms, if he love the intellectual and spiritual character, there would appear magnetic attractions in the eye which burns with such a flame as can only be seen in the few. The blonde is the choice of some, and the brunette with others. The color of the eye, shade of the hair, complexion, all go to form certain styles of beauty. Grace of motion and refinement, and culture of expression, after all, make woman, to our mind, more beautiful than certain physical peculiarities distinctive from the rest of womankind.

R. Grant White, in the *Galaxy*, gives us a very entertaining article on this subject. In speaking of the BEAUTY OF ENGLISH AND AMERICAN WOMEN, he says: "One day a lady whom I had the pleasure of taking in to dinner in a country house near London, and whom I had soon found to be one of those simple-minded, good-natured, truth-telling women who are notably common in England, spoke to me about some ladies who on a previous day had attracted her attention, adding, 'I knew they were Americans.' 'How?' I asked. 'Oh, we always know American women!' 'But how, pray?' She thought a moment, and answered: 'By

their beauty—they are almost always pretty, if not more—by their fine complexions, and their exquisite dress.' I did not tell her that I thought she was right; but that she was so I had by that time become convinced. And yet I should say that the most beautiful women I had ever seen were English women, were it not for the memory of a French woman, a German, and a Czech. But the latter three were exceptions. Beauty is very much commoner among women of the English race than among those of any other with which I am acquainted; and among that race it is commoner in 'America' than in England. I saw more beauty of face and figure at the first two receptions which I attended after my return, than I had found among the hundreds of thousands of women whom I had seen in England.

The types are the same in both countries; but they seem to come near to perfection much oftener here than there. Beauty of feature is, however, sometimes more clearly defined in England than here. The mouth in particular, when it is beautiful, is more statuesque. The curves are more decided, and at the junction of the red of the lips with the white there is a delicately raised outline which marks the form of the feature in a very noble way. This may also be said of the nostril. It gives a chiseled effect to those features which is not so often found in 'America'; but the nose itself, the brow, and the set and carriage of the head are generally finer among 'Americans.' In both countries, however, the head is apt to be too large for perfect proportion. This is a characteristic defect of the English type of beauty. Its effect is seen in Stothard's figures, in Elty's, and in those of other English painters. Another defect is in the heaviness of the articulations. Really fine arms are rare; but fine wrists are rarer. Such wrists as the Viennoise women have—of which I saw a wonderful example in the Viennoise wife of a Sussex gentleman—are almost unknown among women of English race in either country. It is often said, even in England, that 'American' women have more beautiful feet than English women have. This I am inclined to doubt. The feet may be smaller here; and they generally look smaller because English women wear larger and heavier shoes. They are

obliged to do so because they walk more and because of their moister climate. But mere smallness is not a beauty in a foot more than any other part of the body. Beauty is the result of shape, proportion, and color; and feet are often cramped out of shape and out of proportion in other countries than China. A foot to be beautiful should seem fit for the body which it supports to stand upon and walk with. It is said by some persons, who by saying it profess to know, that nature, prodigal of charms to English women in bust, shoulders, and arms, is chary of them elsewhere, and that their beauty of figure is apt to stop at the waist. Upon this point I do not venture to give an opinion; but I am inclined to doubt the judgment in question upon general physiological principles. The human figure is the development of a germ; and it is not natural that, whatever may be the case with individuals, the type of a whole race in one country should present this inconsistency. Possibly those who started this notion were unfortunate in their occasions of observation and comparison."

#### The Value of a Greenback when kept in Circulation.

—Mr. Brown kept boarders. Around his table sat Mrs. Brown, Mrs. Andrews, the village milliner; Mr. Jordan, a carpenter; Mr. Black, a baker; and Mr. Hadley, a flour, feed, and lumber merchant.

Mr. Brown took out of his pocket-book a ten-dollar note, and handed it to Mrs. Brown, saying:

"Here, my dear, are ten-dollars toward the twenty I promised you."

Mrs. Brown handed it to Mrs. Andrews, the milliner, saying:

"That pays for my new bonnet."

Mrs. Andrews said to Mr. Jordan, as she handed him the note:

"That will pay you for your work on my counter."

Mr. Jordan handed it to Mr. Hadley, the flour, feed, and lumber merchant, requesting his lumber bill.

Mr. Hadley gave the bill back to Mr. Brown, saying:

"That pays ten dollars on board."

Mr. Brown passed it to his wife, with the remark that that paid her twenty dollars he had promised. She in turn paid it to Mr. Black to settle her bread and pastry account, who handed it to Mr. Hadley, wishing credit for the amount on his flour bill; he again returned it to Mr. Brown, with the remark that it settled for that month's board. Whereupon Mr. Brown put it into his pocket-book, exclaiming that he "never thought a ten-dollar bill would go so far."

Thus a ten-dollar greenback was made to pay ninety dollars indebtedness inside of five minutes. Who says Greenbacks are worthless?

**Did'n't Know which was the other Gentleman's.**—A good story is told of an hostler, who was sent to the stable to bring forth a traveller's horse. Not knowing which of the two strange horses in the stalls belonged to the traveller, and wishing to avoid the appearance of ignorance in his business, he saddled both animals, and brought them to the door. "That's my nag." "Certainly, your Honor, I know that very well, but didn't know which was the other gentleman's."

**Courting in Church.**—An Illinois clergyman is reported to have said the other day at the laying of a corner-stone of a new meeting-house: "If boys and girls do their sparking in in church, I say amen to it. I have a daughter whom I cherish as the apple of my eye. When she is of suitable age, I would rather she should be courted in the house of God than in a theatre."

**England Honoring an American Citizen.**—The reception given in London recently at the residence of Minister Pierrepont, in honor of ex-President Grant, was a most brilliant affair.

The house was superbly decorated with flowers. The large drawing and reception rooms were crowded from to until 1 o'clock. At least one thousand persons were present, comprising all the best and most distinguished of English and American society in London. Ex-President Grant received with Mrs. Pierrepont and shook each person's hand. Mr. Pierrepont received with Mrs. Grant. All the members of her Majesty's Cabinet were present except Lord Beaconsfield, who is ill, and almost the entire diplomatic corps attended, the Japanese and Chinese Ambassadors being especially remarkable. A large number of members of Parliament, Mr. John Bright, Mr. Gladstone, Mr. Tom Taylor, Mr. William Black, Rev. Moncure D. Conway, Professor Schliemann and the Earl and Countess of Caithness were among the distinguished guests. Nearly as many Americans as Englishmen were present.

**Good-by.**—The Rev. Dr. Taylor, of the New York Tabernacle, lately exhorted his church members to take their religion with them into the country, and not be like the little boy who said his prayer, "Good-by God; I am going to New Jersey for a month."

**"Air them to defend me?"**—The custom of appointing young lawyers to defend pauper criminals received a back-set the other day in court. His Honor had appointed two young lawyers to defend an old and experienced horse-thief. After inspecting his counsel for some time in silence, the prisoner rose in his place, and addressed the bench: "Air, them to defend me?" "Yes, sir," said his Honor. "Both of em?" inquired the prisoner. "Both of them," responded the judge. "Then I plead guilty;" and the fellow took his seat, and sighed heavily.

**The Vox Populi.**—"I tell you, sir," said Dr. — one morning to the village apothecary, "I tell you, that the *vox populi* should not—must not be disregarded." "What, doctor!" exclaimed the apothecary, rubbing his hands. "You don't say that's broken out in the town, too, has it? Lord help us! What unhealthy times these are!"

**"Dont go in."**—Scene in front of a Fifth Avenue mansion. —First swell: "Don't go in, Augustus; her father has become a bankrupt." Second swell: "Pon honor, Charles, all the more reason I should continue my suit. The old gent, like all bankrupts, is sure to come out a half million richer." Augustus steps up and in.

### III. PORTLAND, THE WHITE MOUNTAINS AND LAKE WINNIPISEOGEE.

OBSERVATION CAR.

CRAWFORD NOTCH (LOOKING NORTH), WHITE MOUNTAINS.  
VOL. IX.—11

ONCE it required from three to six weeks to visit the "Crystal Hills" and inspect their various points of interest; and the "journey," as it was appropriately called, involved much hardship and no small amount of adventure and peril, between stage-riding, horseback-climbing and foot-scrambling. Its expense, too, was what very few could afford. Now, the "trip," as we truthfully term it, is made in from one to two weeks, including the sight-seeing and the time occupied in going and returning, if one does not live more than five hundred miles away. In this short time much more is seen and enjoyed than formerly, as many more places of interest have been discovered and opened to the public; and the facilities for reaching these and of entertainment are such as not only to remove danger and fatigue nearly out of the question, but so as to make every sight and effort highly pleasurable. "The world does move," even as high up as Mount Washington, whose serene

and lofty summit pierces the clouds. Apropos to this thought, and a significant commentary upon it, at this moment we have received a communication from "Mount Washington Summit," over the signature of Edwin Judkins, the first and present conductor of the "Mount Washington Railway," giving valuable information which we had solicited respecting this interesting railroad and triumph of engineering skill. It is emphatically "a message from the clouds." In fact this article will, much of it, be occupied in

Railroad," including as a link the "Boston, Lowell and Nashua" road.

For visiting the east side of the "White Hills," the "Eastern Railroad" *via* Portsmouth, Great Falls and North Conway, is a most interesting and enjoyable way.

But the route which we would advise all to take, if they have a plenty of time, the fare being the same, is by way of Portland, over the "Portland and Ogdensburg Railroad." Portland can be reached either by the railroad or steamboat lines from Boston. This is the royal road to the "Monarch of the Mountains" if you would inspect the wonders of his dominions on either side, or in any part of the charmed realms. We have looked forward with the greatest degree of interest from the inception to the completion of the enterprise, to the time when this route would give the tourist the wondrous key that should unlock to his admiring gaze the mysteries and beauties of a region that has more charms than any other

FALMOUTH HOUSE, PORTLAND, MAINE.

detailing what we saw and learned while the clouds were around us or beneath our feet; and where in fair weather we had twenty minutes more of sunshine than the average inhabitant of "the world below."

Among the many routes and combinations for reaching the White Mountains from Philadelphia and New York, that through the Connecticut and Ammonoosuc Valleys *via* New Haven, Springfield, Bellows Falls and Wells River, is undoubtedly the most attractive and delightful one, especially taking into account the exceptionally beautiful region you pass through. There are others that have great attractions, and all the leading routes have special features of interest. From Boston, the most direct, and a very picturesque and delightful, route to the west side of the mountains, is that of the "Boston, Concord and Montreal

this side of the Rocky Mountains, if not in the country—a region, which certainly, if we take into account both the many objects of interest and the facilities for reaching and enjoying them, has no equal in America. Much as we had looked for from the road and the route, our expectations were fully met; our anticipations of joy in reveling in the choicest, rarest beauties of nature were more than realized.

The Portland and Ogdensburg Railroad is peculiarly fortunate in having so classic and beautiful a town to start from as Portland, and so fair and fine a business place for its northern and western terminus as Ogdensburg; and still more in having its route through the most picturesque and attractive portion of the continent.

There is very little in New England, Northern New York, or the Canadas worth seeing, that is

not reached directly, or by easy connections, through this route. It suggests at once visions of the beautiful and babbling Saco, the tortuous and raging Androscoggin, the grand and glorious "White Hills," the wild Ammonoosuc, the quiet and tranquilly beautiful Connecticut, the rich green Highlands of Vermont, crowned by Mount Mansfield, and adorned with those gems of brightest lustre, lakes Dunmore, Willoughby, and Memphremagog, the scenic beauties and historic memories of Champlain, the wild-wood charms of the Adirondacks, the grandeur of Niagara, and the countless attractions of the St. Lawrence, and the Dominion of the Canadas beyond, which are opening up yearly with increasing interest to the people of the States. In short, it brings before the vision of those who have an eye to see and a soul to appreciate, anticipations of a feast of beauty and flow of soul such as language can feebly indicate but never adequately portray—leaving scenes that can neither be painted nor described, to be appreciated by being seen.

Portland being our starting-point, and a prominent watering-place, we will detain our readers a short time in giving brief descriptions of it, they in the meantime preparing their minds for the beauties and glories that lie beyond.

The very name of this fine city, which is the metropolis of Maine, and a great railroad and commercial centre, suggests refinement, beauty, and renown. When it is spoken of, we think of its broad, deep harbor, its elevated, delightful, and almost insular location, its cool and salubrious air, its broad streets, and fine public and private edifices, and above all, its community of intelligent, enterprising and refined people. We recur to it with pleasure and the pride of Americans, as the birthplace of Longfellow, Willis, "Fanny Fern," Ann S. Stephens, John Neal, the journalist and poet, Neal Dow, the champion of temperance; of Commodore Edward Preble, the hero of the war with Tripoli, of Judge Nathan Clifford, of the

United States Supreme Court, and other distinguished men. We remember that it has been the home of Senators Evans and Fessenden, Governor Washburn, and many more persons eminent in the State or National councils. We remember also, with melancholy interest, that it was the birthplace of the brilliant but unfortunate Prentiss, the best stump speaker of America, whose matchless elo-

SEBAGO LAKE, BRIDGETON, MAINE.

quence thrilled and set on fire the Valley of the Mississippi and the great Southwest, whose premature death is a perpetual beacon of warning against bad habits, and in the silencing of whose silver tongue and magnetic, flaming words of eloquence, it is thought the brightest genius and most striking example of American oratory was extinguished.

Much as there is of interest and influence clustering around Portland, it is in territory a mere patch or point of land. It contains, including the islands in the harbor, but 4,600 acres; without them, but 1,666 acres, which is almost exactly the size of Webster's farm at Marshfield when in the occupancy of its illustrious owner. But small as the area of this city is, it is beautifully varying and picturesque in surface, with an elevation ranging from fifty to one hundred and seventy-five feet; it

contains fully 35,000 inhabitants; has a valuation of over \$31,000,000; nearly \$55,000,000 of exports and imports, which is almost twice as great as those of Philadelphia; twelve lines of steamers and railroads centering here; and a harbor so deep, broad, and accessible that it was the only one on our coast which the company that constructed that "leviathan of the deep," the Great Eastern, presumed to think of entering; though it was afterwards found that this ship could enter several of our leading ports.

As a summer resort it has peculiar advantages in the ample means of transit, the purity and coolness of the atmosphere, the excellent boating and bathing facilities, the numerous points of interest in and around the city and harbor, opportunity for making purchases, the various privileges of refined and Christian society, and the excellent hotels and boarding-houses that abound here. They have at least five large public houses that are claimed to be first-class. Of these the Falmouth Hotel takes the lead. It is six stories high, has two hundred and five rooms, and can accommodate some three hundred guests at once. Its fine front is of light sandstone, and the entire edifice looks much better than the picture herewith given. The proprietor and his principal clerks are gentlemen in the best sense of the term, and the house first-class in all its appointments. It is open the year round, but makes summer boarding a leading feature. We noticed a large number of persons of the most respectable appearance, in addition to the many transient guests which they had.

The number of tourists who visit Portland, and the summer boarders who make trial of its many privileges and excellent fare, is deservedly great and steadily increasing from year to year.

We left the metropolis of "the Pine-Tree State" with the most favorable impressions and many pleasant associations connected with both the place and the people, exclaiming of it silently, oft and again, as the amiable aeronaut Blondin, in the poverty of his English, but in the sweetness of a refined and grateful spirit, and with the exquisitely good taste of a Frenchman, once said of Springfield, Massachusetts, "Beautiful city! Beautiful city!" We should have parted with its refinements and attractions with regret, only that we turned our face towards "the everlasting hills," the beauty and joy of the earth, the throne and peculiar habitation of the Almighty, and the

dwelling-place of the best races and types of mankind. The mountains gather and pierce the great reservoir of the clouds, distribute their waters over the continents, and let them gently down to the ocean again. Their influence upon man himself is as marked as upon the atmosphere. They have ever been the home of liberty and religion, and the inspiration of the noblest sentiments that elevate and lead the race.

The morning train leaves Portland at seven o'clock, and reaches "Fabian's," near the foot of Mount Washington, at 11.30; but not making connection with the first train for "The Summit," the latter is not reached till seven in the evening. We did not travel so fast as this, but preferred to take time to see what was worth seeing, both along the main route and on those little branches and spurs, where the most interesting objects often lie concealed, and richly repay the trouble of looking them up. The first part of the way is through the valley of the Presumpscot, a pleasant and fertile region, with nothing striking in the scenery till we reach Sebago Lake, seventeen miles out. We pass one or two pretty falls, and more interesting still, at Windham, about eleven miles from Portland, the birthplace of John A. Andrew, the celebrated war Governor of Massachusetts. Sebago Lake, with its vast reservoir of the crystal fluid, is the source of supply for Portland, fortunate in having such pure and wholesome water so near at hand. But Sebago Lake has other attractions of a less utilitarian but more poetic kind. It is one of the most fair and lovely sheets of water in New England, ranking, as some think, with Lake George, Willoughby, Winnipiseogee and others of greatest beauty and note. Briefly described, it is a deep clear body of water, eleven miles by fourteen in extent, with high shores of a beautiful contour and pleasing aspect. Its outlet is the Presumpscot River, formerly called Sebago, and its principal inlet a large navigable stream, called "The Songo." The name smacks of Indian origin, though it evidently lacks that euphony of sound and indescribable charm that generally attaches to Indian names. This river is thought to be one of the crookedest streams in the world, for it takes six miles of roundings and grotesque contortions to make an actual progress of two miles. We have never seen its match except in Buffalo Bayou, Texas, a stream of which it strongly reminds us, except that it is not so

muddy, and possibly not as deep. But two men have been found competent to navigate this singular stream without "banking" the steamers. The term *banking*, which means running aground, reminds us of the fact that one end of the boat constantly points to the shore, and sometimes both, and the danger of running into the banks is so great and constantly recurring, that the slight danger involved and the novelty of the continually shifting scene are exciting in the extreme, keeping pilot and passengers ever upon the *qui vive*.

This river and two other bodies of water, one of which is called Long Lake, and is a very beautiful sheet, having scenery at its north end worthy to be painted, with the broad and fair Sebago, constitute a continuous route of thirty-four miles, touching upon several pretty hamlets and summer resorts, which is traversed by two fine steamers, the "Sebago" and "Mount Pleasant," each of which makes one round trip daily during the season of summer travel. The Sebago connects with the morning and evening trains from Portland, so that one can take this delightful excursion over Lake Sebago, and reach North Bartlett, amid the White Mountains, the same day, as we did, at the same time surveying one of the fairest lakes in New England, and taking, at a very trifling cost of time and money, one of the most delightful and enjoyable excursions.

We should have mentioned that as we go up the lake, whose course is northeast and southwest, we pass the whilom residence of Hawthorne, off at our right. The name of the town we do not recall.

We left Sebago station at 6.42 and reached Frank George's Hotel, Upper Bartlett, at nine o'clock. Soon after leaving Sebago Lake, bearing northwest, we strike the Valley of the Saco, and follow this stream all the way to the mountains. It is not a wild and sterile, rugged region, but a smooth, cultivated country of hills and valleys,

with good farms, fine villages, and prosperous towns. We had glimpses of one or two attractive Falls on the Saco, but did not stop to view them.

At Fryburg—best known as the location of a pond where occurred "Lovewell's Fight," in the days of Indian wars—we leave the State of Maine, and bearing slightly westward, enter the borders of New Hampshire, at North Conway. Here we

SCENE ON THE RIVER SACO, MAINE.

are at the very gateway of the mountain region, and are brought into the presence of some of the finest scenery which it offers to the admiring gaze of the tourist. We state this chiefly on the authority of Starr King and others, who have described its beauties in the most varied and glowing terms, and made this whole region classic ground. We visited the place twice, but once it was in the dusk of evening, and the other time it was lowering weather, and the highest peaks and best views were obscured by the clouds.

The hotels of North Conway have a good reputation, the leading one of which is the Kearsarge House, beautifully located near the depot of the "Eastern Railroad," which has a branch extending to this place, and with the main road, it con-

stitutes one of the most interesting and feasible routes to the Mountains.

At the upper end of the town, or just beyond it, is a hamlet, with a very pleasant location, and some of the best hotels in the place. This is especially true of the "Intervale House." The fine scenery, abundant accommodations, and the delightful location and surroundings of the village itself, make North Conway a favorite place of resort, and large numbers annually flock to this magnificent panorama of the beauties of nature—to this Mecca of the invalid, where hay fever and other ills speedily disappear.

At Upper Bartlett there is but one hotel, kept, as we have already stated, by Frank George. It is a cosy, homelike place, where the traveller soon realizes that he is among friends who seek, without extra parade, to make him as comfortable and happy as possible. Soon everybody feels—most desirable state—very much at home. This house is capable of accommodating from fifty to a hundred persons. The fare is good and the prices low.

But while there is but one hotel, there is the purest air and water almost in the world, and much that is worth seeing of the grand and beautiful in nature. The valley is a tract of table land, elevated some fifty feet above the Saco, in the form of an ellipse, about five miles in length by two in width, and surrounded by some of the noblest elevations and most attractive scenery in the White Mountain region. Some twenty peaks, including Mount Crawford, are in plain sight from the hotel, each of which would be considered sublime and

grand in any other locality. From Mount Langdon, commanding one of the finest views anywhere to be found, two hundred peaks can be counted, including Mount Washington and other distant and noted mountains.

But it is the combination of grandeur and beauty which gives a charm to the scenery here that cannot be described.

The whole view is like a vast and splendid amphitheatre on a scale of magnitude and beauty that would put to blush any structure known to the architecture of ancient or modern times. We are certain that when justice comes to be done to the scenery in the different sections of the White Mountain region, the splendid views that surround Upper Bartlett with grandeur and beauty will give to that most interesting locality far greater prominence than it has hitherto enjoyed.

About five miles from Upper Bartlett you come to the grand ascent through

BEMIS STATION, WHITE MOUNTAINS.

the "Crawford Notch," and you realize for the first time, from the grades, that you are ascending mountain gorges and declivities. Hitherto your ascent has been so gradual and the grades so light, that you would not imagine yourself amid Alpine heights, but for the mighty summits that greet the view on every hand. Now for nine miles—that is, from Bemis station to the Crawford House—the grade is one hundred and sixteen feet to the mile, or more than one thousand feet in all; but being equally distributed over the whole distance, the ascent is steadily and easily made. The "iron horse" scarcely gives an extra strain or puff. He seems to act from the force of

habit, and takes you up the grand gateway with all that indifference that usually characterizes the performance of a daily task. All this one can excuse in a faithful servant that bears you along with a strong arm and steady foot, giving you the fullest opportunity to see and enjoy the wondrous sights.

And yet, in this nine-mile ascent, what historic places, what monuments of Almighty power, and what scenic glories do we pass amid and through! Yonder, off at the right, is Mount Crawford, high and rugged, but not so grand and lofty as those we shall soon see. Here we come to the Frankenstein Bridge, with its trestle-work eighty feet high or deep, depending upon whether you look up or down, the framework of iron, so thoroughly braced and strong that there is not the least danger in passing over it. Yonder, north of Crawford, and nearer to the "pass," is Mount Webster, bold, abrupt, broad-faced, and colossal in its proportions, with features that, like those of its namesake, appear more grand and striking the nearer you approach them. And here upon the left, cropping down steeply to the very track, is Mount Willard, one of the most lofty and precipitous of all the White Mountain range.

Step to the rear of the car now, and cast your eye up those mighty declivities and see how the track stretches athwart its almost perpendicular sides, and the car moves like a fly crawling along upon a line that spans the steep roof of a house. Now you must open the windows on the east side of the car and keep watch for an opening in the trees, if you would catch a glimpse of the famous

"Willey House," a sad monument of a whole family buried in a mountain slide, fifty-one years ago come the 28th of this month (August). There, that is it: that little low red house to the north of the group of buildings, used now as then for a place of entertainment, only much enlarged. We should like to recite the sad and touching history of this family thus suddenly buried alive, if it

accorded with our present design. But our obliging conductor has already opened the windows upon the left or west side, so that we may see where the slide or avalanche came down with such resistless and overwhelming force as not only to entomb a whole family, but to fill up much of the valley below and turn the Saco from its course.

Just look up those towering sides, more than two thousand feet high and so steep that you could not stand there a moment; almost perpendicular, in fact, so that, moistened and loosened by

heavy rains, it is no wonder that the incumbent mass of earth came down in the mighty avalanche to which we have referred. These naked rocks, stripped of their covering of earth and trees more than fifty years ago, have in these long years scarcely veiled their skeleton forms, even with a coating of moss, but seem to mourn the hapless lot of the buried family alike in the glare and glamor of the sunlight, and in the beating and howling of the pitiless storm. And storm and tempest as they sweep through the recesses and caverns of these vast mountain solitudes, so deep and towering that they seem to join two worlds, earth and sky, shall continue to chant their solemn requiem down through the countless ages.

FRANKENSTEIN TRESTLE (LOOKING SOUTH), WHITE MOUNTAINS.

We are now approaching a huge precipice some two thousand feet perpendicular height, confronting it face to face, apparently ready to run into its stony recesses—its impregnable and towering walls of adamant rock. But no! like a charmed path, or the magic thread of the labyrinth, the supple and sinuous iron track takes us safely and smoothly around the overhanging cliff, and averts the threat-

the line of tourists, and from car to car, while all eyes are strained to catch the sight, and all ears attent to hear the explanations that the various inquiries elicit. But seeing is knowing, and as all look, all know at a glance what the striking phenomena or freak of nature called "The Notch" is. All the vague and dreamy notions which hearsay testimony had woven around the imagination pass

away like smoke before a strong wind, or mist before the rising sun, and the clear atmosphere of truth and reality settles at once around the mind like the light of day. We all know that the real Notch is that huge gap or gorge reaching from side to side, and rising with the mountains almost to the sky, the bottom of which is the old road or turnpike, rugged, wild, and precipitous on all sides, which our fathers from necessity traversed on business, and which was visited by the sight-seers of other days, at much trouble and expense, but perhaps in quite as enjoyable and appreciable moods and keen a relish as we can claim.

That little cut in the rocks which the railroad man—fine, obliging fellow that he is!—calls "The Notch," and tells us is sixty feet deep, is only a niche in the side of the true Notch, a little rut or auger-hole chipped out by the puny hand of man, wholly unlike the grand cleft through the mountain's side from base to summit, which the Great Architect and Engineer who reared these "Everlasting Hills" has carved out to teach a lesson to man, and as a sign of His strength and glory.

The views herewith given represent "The Notch" from two aspects—one as we go north, just before reaching the cut for the railroad, with the celebrated and now historic Crawford House in the distance; the other gives the view looking south, along Mount Willard on the right and far down the Saco, which is here a tiny mountain stream, and out through its wild and picturesque valley, along many windings and across many gulfs and gorges, almost the entire length of the nine-mile grade that spans the Notch.

Mount Willard, which must not be confounded with Mount Willey, is ascended from the Crawford House, by a good bridle and carriage road,

CRAWFORD NOTCH (LOOKING SOUTH), WHITE MOUNTAINS, N. H.

ened danger just when it seems most imminent and unavoidable.

Those towering cliffs to which we have just referred, and which seem to be a mighty wall connecting Mount Webster to Willey, with the break only of "The Notch," go by the name of Mount Willard, of which we will speak soon.

But here we observe that we approach a grand turn around the huge ramparts of stone, and it must portend some new revelation of the wondrous works of nature, if not some startling and thrilling sights. With bated breath we watch and wait. Ah! "It is 'The Notch,'" says the conductor. "The Notch!" "The Notch!" is repeated by the passengers. The thrilling watchword passes down

through one of the finest forests in all the White Mountain region. This cool and umbrageous pathway can be surmounted and highly enjoyed on foot, the method of ascent which we adopted, both from economy and choice. The whole distance, with its grades and windings is scarcely three miles, and is easily accomplished by any person of a moderate share of vigor and experience as a pedestrian. We had heard much of the views to be had from Mount Willard, and they fully met our most vivid and glowing conceptions and most sanguine anticipations. It is not the height at which you stand and from which you gaze, but the peculiar position of your lookout or point of observation, with reference to the surrounding peaks and the valley below. You stand just that high and just at that point, where the huge rocky bulwarks and the grim features and gigantic forms of the monarchs of the mountain stand out in boldest relief before you; while the beautiful valley below assumes the form of a vast yawning abyss, down into whose almost fathomless depths it makes one giddy to look, and from which you shrink back with shudderings lest somehow you slide and fall into it. The sublime and awful appear here in their grandest forms and most striking characteristics. Mount Willard is to the observer of natural scenery among the mountains, what the right position is, in viewing a gallery of paintings from the hands of the great masters. It is a raised platform, from which you can see a tableau more imposing, a panorama more magnificent and impressive, than was ever prepared by the hand of man, and which the Almighty Architect alone could construct.

In the vicinity of the Crawford Notch, there is much of interest to the tourist who is a true lover of nature, an earnest and childlike student of its mysteries and beauties, to which we cannot

even allude. Of course all will visit the "Flume," the "Silver Cascade," and "Beecher's Falls," they are so interesting and so very near and accessible. And if visitors can well do it, we would advise them to take the bridle-path, once the old carriage road, from the Crawford House to the summit of Mount Washington.

The whole distance by this route is, we believe, about nine miles, and to those who can bear the fatigue it must be a most romantic and delightful adventure. Yet with the fine facilities now provided for reaching and ascending the mountain by rail, as the least expensive and on the whole the most comfortable and enjoyable one, most will choose this method. Those who can afford the time and expense, should try both ways.

The summit of the Notch is at "Crawford's." From here it is a gently descending grade to "Fabian's," a distance of hardly four miles. The finest view of Mount Washington that we have seen, one that does not bring you so near as to make

THE FLUME, FRANCONIA NOTCH, WHITE MOUNTAINS.

the rugged features appear huge and repulsive, nor so distant as to dwarf and dim their more interesting and marked characteristics, is from the piazza of the "Fabian House." One point, near the south end, is particularly favorable and happy in its revelations of the beauty and glory of this "monarch of the hills." As he sits there, enthroned in the very realms of the sky, in serene and peerless majesty, you gaze at the grand spectacle with rapt awe and unutterable admiration and delight.

From Fabian's to the base of the mountain it is just six miles, and as hitherto by rail; but this last distance is made not over the Portland and Ogdensburg Railroad, but over one provided for our use by the Boston, Concord and Montreal Railroad Company, which, by a spur or track completed last year, and which was appropriately

signalized by driving the golden spike, furnished the last link that gives to the pleasure-seeking and travelling public unbroken railroad transit to the top of Mount Washington.

On our way from Fabian's we get occasional glimpses of the "Royal Mount," several of which are very fine; one especially, that is to be seen about two miles from the "base," is sublime and impressive in the highest degree. Language cannot describe it. No painter can catch and fix the resplendent view. At one moment the summit is seen to stand forth in calm and serene majesty, the "imperial features" clearly marked and radiant with the glowing light of the sun; then presently the face is veiled in a cloud, enhancing the impression by partial concealment from too familiar gaze; meantime the body of the mountain is clothed with a halo of purple and gold which seems to reflect the beauty of earth and the glory of the heavens. As we gaze with rapt emotions and filled with transports of delight, fancy touches the picture, giving it unearthly beauty, and imagination

takes wings till the whole mountain shines like a summit of burnished gold, and, transfigured before us, glows with the light and beauty of that "upper mount," which the conception of all sometimes portrays, the heathen guided by the light of nature aspire after, and which was clearly revealed to the prophet of God at the isle of Patmos.

Well, here we are at the foot of the mountain, and as we look up this grand stairway of the skies, this stupendous monument to the power of the Creator, we wonder how it could be thus reared on high and kept in its place. We wonder, also, how we can ascend its steep and rugged sides to its towering summit. Time and again as we have looked up this precipitous pile of rugged rocks, we have resolved that we would ascend it on foot—that we would thus see all the sights and know how our fathers did the thing—above all, we would

learn how to value the crowning reward, by first earning the coveted prize.

And to-day, as usual, misgivings come over us. Why should they not? after having walked six miles—for although our "passports" were all right, and we could have rode on the cars, we wanted to enjoy the sights of the old route, and especially that splendid view to which we have referred, and to see once more the "Beautiful Falls of the Ammonoosuc"—with the thermometer in the "nineties," and our dickey melted down to zero—the zero of hot water, not the freezing

cipher—and three miles of climbing looming up before us—all of it up, up, up, over a pathway rough as a bed of lava and steep as "Jacob's Ladder," a part of the tramway being in fact named after that poetic stairway, up and down which the patriarch's celestial visitors used to walk; or, that more brilliant one that adorns the heavens. Why not, I say, let one's courage fail him at such a time? And why should it not, with such a fine comfortable car coming up just at the moment when you

are balancing motives, with a gay company of tourists made up of fair and smiling ladies and merry gentlemen?

We surrender, not *at* discretion, but *to it*, and take our seat with the sensible party in the car. Up, up we go! The spunky little engine, spluttering and clicking all the time at a great rate, takes us along, pushing and climbing hand before hand, all wondering how it can do the thing and do it so well, and some pale with excitement and fear lest it should fail us. But nothing convinces like the doing of a thing, and soon all, or nearly all of the passengers, become reasonably assured of their safety, and continue to enjoy themselves in a cheerful, talkative manner. Some are gazing from the car windows upon the wondrous scenes with rapt emotions, and are lifted up with great thoughts. Others are filled with awe and strange

OLD MAN OF THE MOUNTAIN, FRANCONIA NOTCH, WHITE MOUNTAINS.

emotions, they scarcely know how or why. Others still are wild with excitement and inclined to be merry.

"Down in front!" often comes from those in the rear of the car, *bottom* we should say, as they are nearly under us. A goodly number sit on the upper or forward platform—for remember that we are backed up, not drawn, and let down when we return, the engine remaining all the while on the lower end of the train—professedly there to see better, but really, uncharitable thought! so as to

language and space would fail us, and we should be compelled at last to say to the reader, "You must go and see for yourself. No mortal man can tell what he sees and feels on the sublime heights of Mount Washington! Its wonders and glories, its ecstatic and transporting thoughts can never be spoken, much less written. They can only be experienced and felt."

A few interesting phenomena we will discuss and a few items of information give.

The "Mount Washington Railway," Walter

PROFILE HOUSE AND ECHO LAKE, FRANCONIA NOTCH, WHITE MOUNTAINS, N.H.

jump off easily in case anything should give way in the rear.

For the first mile we realize that we are ascending great heights, with magnificent landscapes opening before us. For the next mile we obtain views of distant lands and noted mountains, and are so high that we lose nearly all appreciable means of measuring our ascent. For the last mile, and especially at the termination of it, we seem to be suspended between the heavens and the earth, and to occupy neither world, not exactly "hanging loose," but standing upon some stupendous and towering monumental pile, on the very pinnacle of earth and sky, ready to take a look into both worlds!

We shall not attempt to describe all our emotions while upon this "mount of mounts." Both

Aiken manager, was completed in 1869, this being the tenth season it has been in operation. It is three miles in length, lacking a few feet, and surmounts a perpendicular height of 3,600 feet from base to summit, the height of the mountain being 6,296 feet above the sea, as now reckoned. This makes it 1,016 feet more than one mile in altitude. Some measurements give a few hundred feet more than this. But that which is here given, and which is doubtless very nearly accurate, makes it the highest mountain this side of North Carolina and the Rocky Mountains. The "base" is 1,200 feet above Fabian's, which would indicate that the latter is 1,496 feet above the level of the sea.

They sometimes take four cars and two hundred persons up the mountain at once, and as many as

four or five hundred in a day. They usually make two trips a day, during the season of pleasure travel, stopping on the summit over night. It takes one hour and a half to accomplish the ascent, the motion being slow but strong; giving the passengers of average strength of nerves a comfortable assurance of safety, yet one always feels a sense of relief when the train ascends to

the travelling public and their many friends at home, who are thus freed from all anxiety respecting those who make the ascent. One great advantage of this safe and pleasant means of reaching the summit is, that persons not physically strong, even the most delicate, unless positive invalids, often the most cultured and appreciative observers, can now make the ascent,

And view the wondrous sight  
With transports of delight.

The reader will most likely inquire, mentally at least, "Does it pay?" Not yet; it has cost, all told, for construction and improvements about \$250,000, and although the fare is three dollars each way, or four dollars for the round trip, the season is short and the investment has thus far been a losing one, at least in its direct income.

The present "Summit House" is large enough to entertain two hundred persons at a time, and is not a mere shell with accommodations for transient visitors, but a large hotel, well built, fastened very firmly to the rocks by iron rods, and well furnished and exceedingly well managed by Mrs. J. W. Dodge and her assistants. The sleeping arrangements—what the traveller most desires at such a place—are superb. Each morning, if it is clear, the

OWL'S HEAD AND MOOSE HILLOCK, WARREN, NEW HAMPSHIRE.

the platform at the "Summit." We certainly do, and we guess others do.

As to the matter of the safety of this road—which by the way is its strongest possible recommendation—there can be no question about it. It has been examined by the best engineers in the country, and pronounced safer than any other road. Better testimony still, it has conveyed in its cars some ten thousand persons each season for nine years without a single accident. It is a great feat of engineering invention and skill, and Mr. Sylvester Marsh, the inventor, who, we believe, is a resident of Littleton, has thus made himself a benefactor of his race, particularly

guests are called up by a bell, in season to see the sun rise. If they are such leaden sleepers and stupid travellers as not to desire to witness this glorious sight, they can disregard the call and sleep on, till their more animal nature calls them to breakfast. This house succeeds one that had been built twenty years and is now used for a printing-office; and this was preceded by a sort of cabin whose age it would be hard to tell. There is generally a bank or sea of clouds between the mount and the valley below reaching apparently to the eastern horizon, so that the "glorious orb of day" rises as though coming up out of the ocean, especially as when seen skirted with light.

low clouds. The sight is worth going far to see, and we witnessed and enjoyed it too, for the first time, on the first day of August, the present year. As to the number of clear sunrise and sunset scenes, there are undoubtedly great misconceptions. We have been told that a clear good view of this phenomenon could be had but a few times in the season, and that a person in making many trips, might not witness the interesting sight at all. Judge of our surprise—and we think it will be new to most persons—when informed, on the testimony of the conductor, who has been on the road and stayed on the summit at night for four or five years, that *fully one-half of the time the sun rises and sets clear, as seen from Mount Washington*. This, of course, affords the greatest possible encouragement to tourists and excursion parties to make the ascent and to stay on the "Summit" over night. The

JACOB'S LADDER AND MT. WASHINGTON SUMMIT.

lungs, or with heart disease. Yet the conductor informed us, that he had never known any very sudden or serious results, and the effect, when any is noticeable, may

probably be traced in most cases to nervous weakness and the excitement from the novelty and imaginary dangers of the trip.

On one occasion, when the thermometer stood at sixty degrees, and the air was very still, it is described as being like the hot, dry air of a furnace in a close room. This was due largely to the rarity of the atmosphere, though it is seldom the thermometer ranges so high, with a still air at the same time.

The winds blow here with great velocity, sometimes reaching a hundred and eighty miles an hour, as measured by the Government officials, which, as most readers know, has a "Station" on the summit here. Such, however, is the rarity of the atmosphere at this height, that their force is far less. The Mount Washington trains do not run

LIVERMORE FALLS, PLYMOUTH, NEW HAMPSHIRE.

difference of temperature between the "Summit" and the valley below, is from ten to thirty degrees, occasionally reaching even forty. This usually causes no inconvenience, except the precaution of taking suitable clothing to protect one against the change, the difference seeming much greater than it is, on account of its suddenness and the great rarity of the atmosphere. It is thought to be unfavorable to persons affected with bleeding at the nose or

RAILROAD STATION, BETHLEHEM, NEW HAMPSHIRE.

when the wind rises to eighty miles or more an hour. There would be danger of the cars being lifted from the track. Fortunately, the most violent winds occur in the winter season, when the road is not in use. There is a phenomenon often witnessed here, which we have no doubt is connected with the force of the winds, that is their velocity and momentum combined. It is the spectacle of a little white cloud, apparently

ciently condensed to form a cloud when one cannot be formed further down the Mount. Thus it will be seen that the cloud does not come to the summit from other directions, but is formed there and by the mountain itself, in resisting and condensing the atmosphere; otherwise it would speedily blow over, instead of seeming to linger there as it does.

A different phenomenon, but from the same cause, is witnessed on the top of Whiteface, a mountain of

WEIRS LANDING, LAKE WINNIPISEOGEE, NEW HAMPSHIRE.

"lingering" around the summit of Mount Washington, at times like a white gossamer veil, but of more or less size and density; it is almost always there, lifting and settling, expanding and contracting, but still hanging around the "majestic face," to the great annoyance of those below, and less frequently to those on the Mount, who wish to have an unobstructed view; and the mystery is, that it is often seen in the driest, fairest weather, while all around in the plains below, and upon the mountain sides, it is perfectly clear.

The explanation, we think, is this: the mountain is so high and the force of the winds so great that the atmosphere, which is always charged with vapor, that is invisible till greatly condensed, is driven against the mountain top with such force, especially on this extreme pinnacle, that it is suffi-

ciently condensed to form a cloud when one cannot be formed further down the Mount. Thus it will be seen that the cloud does not come to the summit from other directions, but is formed there and by the mountain itself, in resisting and condensing the atmosphere; otherwise it would speedily blow over, instead of seeming to linger there as it does. We found it to be simply water condensed from the atmosphere, by the mountain itself upon the rocks, and constantly dripping and gathering into this little basin or reservoir clear as crystal, and pure as that with which Eve laved her lips in Paradise.

On the summit of Mount Washington but few animals are found, or can live there. We might have mentioned that trees disappear and vegetation of most kinds ceases at about two-thirds the height of the mountain. The porcupine, or hedgehog, is occasionally found and killed here. There is also a species of mouse called the "deer mouse,"

from his color and long ears; unlike the deer, and most other mice, they have long tails. Red and striped squirrels are found occasionally, and one snake which—was killed, of course. In very clear weather ships can be seen at sea, and other objects not often discernible. All have doubtless heard of the clear and beautiful lake, a short way down the summit, yet five thousand feet above tide water. It is called "The Lake of the Clouds," and is situated on the route of the old Crawford Road.

There is one phenomenon seen here which is of very rare occurrence, and must be as beautiful and exciting as it is wonderful. It is called "The Corona." The conditions necessary for this interesting spectacle in nature, are a partially cloudy atmosphere, with a light thin mist towards the sun and a cloud in the background—time of day, at least so far as it has been noticed, the afternoon. Then, when all things are ready, this natural "camera" throws an image of the persons or other intervening objects upon the cloud, which serves as a screen. The image or images are very distinct and perfect, and are seen to move with the motions of the spectators, much like shadows upon the wall. This rare and interesting sight must be exciting and gratifying in the highest degree, but is vouchsafed only to the favored few. The Great Operator does not give notice of what he is about to do, though none are excluded, who appear at the right moment.

As we stood upon the top of Mount Washington and looked down the east side, we had often noticed a curious little basin or valley of deepest emerald green, variegated with white specks that looked like the tiny blocks of a child's playhouse. On inquiry, we found that it was a noted place called "The Glen." On visiting it a few days since, we found it to be a most delightful spot, with one of the finest hotels and most accomplished landlords in all the White Mountain region. It is but eight miles from the summit, by one of the best turnpikes in the country, and daily stages. To miss seeing this place, would be to lose one of the best things of the mountain region.

Littleton, Bethlehem, and "The Franconia Notch," in the heart of the "White Mountain Region," and Plymouth and Lake Winnipiseogee and vicinity, more remote, are interesting and important localities, but we have only space to speak very briefly of the latter place.

We left the cars of the Boston, Concord and Montreal Railroad, at Weirs, after a delightful

trip from the mountains, such as we always have on this road, to take a sail on a lake about which we had heard and read much, that we might see with our own eyes its world-renowned beauty of surface and scenery.

Lake Winnipiseogee is about thirty miles in length, by from ten to twenty in width. Its form is very irregular, but the contour is fine, the shores high, and the valley in which it is located, surrounded by lovely hills and lofty mountains, the most noted of the latter being the "Ossipee" and "Sandwich" ranges. This lake is full of islands, some of which are very beautiful, some very unique in form, and some very large, one being six miles in length. The poetic number of three hundred and sixty-five, corresponding with the days of the year, which has been credited to it, as to Lake George, is doubtless in both cases equally whimsical and groundless. The exact number, by actual count, is two hundred and seventy-six, a marvelous number of islands, as surpassingly beautiful as they are numerous.

Two steamers, the "Lady of the Lake" and the "Mount Washington," make frequent trips across the lake during the season of summer travel, both of them touching at Senter Harbor (erroneously spelled "Center") and Wolfeboro. In crossing the lake to either place, you have some of the finest views that the eye ever feasted on or the imagination pictured. Several of these constitute landscapes worthy of the hand of the greatest master in painting.

The most beautiful place and noted summer resort on the borders of this lake, is the "Senter House," with its fine grounds and magnificent shade.

From an eminence that overlooks the lake and the adjacent shores, which is said to be the best view to be had, we surveyed this most charming of New England if not American lakes. The fair waters of the lake, the beautiful islands, and the picturesque mainland, were clothed in the rich mellow rays of the setting sun, as with garments of light, the lake itself reflecting from its face the many hues of the clouds, and glowing like a mirror of burnished silver in settings of azure, crimson and gold, and constituting the central figure and chief attraction of the matchless scene.

Spell-bound we gazed upon the fascinating view till the shadows of evening fell upon lake and landscape.

# ARCHITECTURAL PROGRESS, AS SEEN IN THE RELIGIOUS EDIFICES OF THE WORLD.

By REV. WILLIAM BLACKWOOD, D.D., LL.D.

VIII. ECCLESIASTICAL ARCHITECTURE IN THE UNITED STATES.

THE OLD CONGREGATIONAL MEETING-HOUSE AT HINGHAM, MASSACHUSETTS—OLDEST IN AMERICA.

THE attention of the reader is drawn to an illustrated article on this subject which appeared in this MONTHLY for March, 1875.

ments of our people in the early years of national life. It was shown that though the progress of our people has displayed all the energy of the Anglo-Saxon race, in the subjugation of

of palatial homes, in the union of our vast territories by iron bonds, and in girdling the world by

COLUMBUS AVENUE CONGREGATIONAL CHURCH, BOSTON.

our commerce, yet in none of these departments of our civilization has greater progress been made than in the sphere of church architecture. It is, no doubt, amusing at the present day on returning from a luxuriously cushioned pew in an edifice with lofty groins overhead, with golden many-tinted lights from rich emblazoned windows flooding the interior with a mingled halo of glory, with long drawn aisles and clustered columns that lift the eye heavenward and leave on the mind a feeling of reverential awe, to turn over the leaves of an old album and look at the pictures of the quaint, rude shrines in which the sires of a former age worshipped God. True, these structures had little beauty of outline. Externally, there was nothing in their form to gratify the eye and satisfy a cultured taste. Internally, all was bald and homely; the hard bench, the stiff unbending back, even if there were a back to the seat, the barrel pulpit up aloft, the huge stove with rambling pipes that stretched up roofward in rigid angularity, and the many-paned windows, all bore evidence of a primitive time. What else could be expected?

VOL. IX.—12

Has there not been a Glastonbury and an Iona; and what of King Edwin's Church of wooden frame where the proud Minster of York now rears its head in splendor over more lowly but still beauteous fanes? Who can forget the early scenes of the Holy Isle; and even at lordly Durham was there not "a little oratory of wattles" before there was a church of stone? The men who braved the ocean, encountered Indians, subdued the forests and made the land the home of liberty, left a fatherland for freedom to worship God; and humble though the sanctuaries were which they erected, they served the God of their fathers with the best which they had. In time, their circumstances changed, and their humble churches bore witness of the change; but taste and science are not perfected in a day. That could not have been expected on the west of the Atlantic which was not to be found in the same age in the lands of our fathers, even with all the wealth which they commanded and with the examples of centuries of progress before their eyes. Uneducated mechanics could only build according to the degree of their intelligence, and it was not strange, therefore, that when the desire for something better than the old square meeting-house was felt, that the wonderful exhibitions were made in Grecian art which towns and villages soon displayed. The village builder made his own

FRIENDS' MEETING-HOUSE AT MATINECOCK, NEW YORK.  
(Built about 1725.)

columns according to his own ideas of diameters. He made them long or short, as the height of his walls demanded, and pediment or no pediment he

which access was to be gained by a stair in the corner of the room. And yet such a contrivance was not thought to be out of place in the building which was dedicated to the service of God.

FRIENDS' MEETING-HOUSE, FLUSHING, LONG ISLAND, NEW YORK.  
(Built in 1716.)

placed his columns where he thought they might ornament his workmanship, regardless of Calli-crates or Ictinus, or any Greek or Roman of the olden time. Columns were columns, and capitals were capitals, and so the builders pleased themselves and wrought as best they could with the means at their command. Still farther, as engravings showed the forms of Grecian temples, why not have churches like them, at least on the outside? During this transition period in this country and in Britain likewise, builders never paused to ask themselves, did Greeks or Romans build temples two stories high, with windows in the flank walls, and then proceed to block up the windows internally, by carrying a floor across the middle of them on which to construct fixed seats for the accommodation of an audience? That which would not have been tolerated in the best apartment of any dwelling-house, was in this condition of "churchly art" quite good enough for the house of God. Any builder would have been considered insane, who would have proposed to enlarge the space of a merchant's parlor or drawing-room, by running a floor across the middle of his parlor windows, so as to enlarge the apartment by a loft projected inwardly some ten or fifteen feet, to

introduced for obvious uses in a different condition of civilization, in edifices of a type and style such as no Greek ever saw? To be sure, such conjunctions were just as lawful on this continent as they were in Britain where they had been introduced, and where all forms of monstrosities and utterly senseless, baseless, barbarous structures had been erected, which served to show how wide-

OLD DUTCH REFORMED CHURCH AT ALBANY, NEW YORK.  
(Built in 1656.)

spread the decay of architectural principles had extended over the land. If the builders of this country had sought for precedents and examples

as authorities or apologies for their achievements, they could have found them scattered all over

CHRIST CHURCH, SACKETT'S HARBOR, NEW YORK.

Britain, where the Ebenezers, the Mount Zions, the Nazareths, and the Bethesdas gave ample evidence of the sad condition of architecture in the Georgian age. As in the case of disease, there are certain maladies that are not confined to the human race. The condition of the atmosphere which is favorable to influenza, will embrace the lower forms of animal life in its influence, and so it was with the Greek architectural fever. Greek churches led to Greek "mansions," and thence it was an easy step to Greek stables, and ere long stables had steeples to them also. The use to which the structure was to be dedicated seemed not to be thought of when the plan was projected, and hence, millions of our population have stood admiringly before a splendid marble structure, with its imposing Ionic columns, its entablature and pediment, and yet from its interior a lofty, bare red brick chimney arises, to show that after all, the edifice is a sham on the outside, for internally it is only a species of a great national foundry for casting and moulding certain forms of the valuable metals. Two matters of great weight here claim attention. First, the

strange neglect of many professed architects who seem to omit so frequently, as they do, all consideration of the uses to which the building is to be devoted for which they have prepared their plan. Thus, in the suburb of one of our largest cities, our travelling public may have their taste cultivated by contemplating a huge building erected in the style and appearance of the nave of a great medieval cathedral, and yet on closer inspection it turns out to be a very essential part of a great gas-house; and so it is in cases manifold. A second and equally important oversight may be seen in churches, dwelling-houses, school-houses, and, indeed, in all classes of buildings. A beautiful picture is designed, an imposing entrance is projected, and on the right a window is balanced by a window on the left, a projection on one side is balanced by a projection on the other side, and thus the whole is complete. As soon, however, as the internal details are entered on, the absence of intelligence begins to appear. Window after window will be deformed by a massive staircase blocking them up and marring their appearance. Where a small apartment is required, a huge window, or it may be the lower half of a great window is used to light it, because a window of

DUTCH REFORMED CHURCH AT NEW UTRECHT, LONG ISLAND.

(Built in 1690.)

the same dimension has been placed elsewhere, and this large opening was constructed merely to

balance the other. If in any buildings shams and attempted deceptions would be out of place, churches at least should be free from them; and yet it is specially in churches, where all should be

be blocked up again. A circular or spiral stair was lighted by windows which also ascended. Any chamber requiring light had an opening of commensurate size; floors were not carried

up by windows, for if two or more were required, each floor was provided with the needed size and number of lights to serve the needs of the occupants, and hence, a spectator by examining the exterior of a medieval church could at once anticipate the arrangements which he would find within. In no modern are the imitations of the past day more conspicuously behind the edifices of a former age, than in this sad want of reality.

Take for instance an old Norman church; the porch, the tower, the apse, the nave or body of the edifice are all exactly just what they outwardly declare themselves to be. Take a modern imitation of a medieval church, internally the windows are nearly hidden by a heavy grating that blocks them up, and the building which in appearance pretends to be an apse or a choir is only a two-story structure, cut up into vestries or school-rooms; and just in proportion to the degree which the knowledge of principles is apprehended by professional men that all such shams will be detected, and truth and reality in architecture will be found to prevail. It is well known that architects have much to contend with, due to the lamentable want of information which characterizes the popular mind, and it is usually found that the more ignorant the members of the "building committee"

ST. PATRICK'S CATHEDRAL, NEW YORK.

real, that the promise of the outside fails to be carried out, and disappointment awaits the visitor who examines the arrangements within. Here it is where the medieval builders excelled, and where they set a lesson to all the would-be architects of our age and land. No sham door was placed where a door was not needed, no window was constructed in order that one-half of it might

be, just the greater is the difficulty to induce to allow an educated architect to have his way. In a neighboring city, a large number of persons belonging to a "building committee" on returning to their homes after business hours usually brought some crotchet along with them, and by their persistent energy, they compelled the architect to put into the edifice which he

erecting a number of members which they had seen in other buildings; and thus they had succeeded in disfiguring a structure which otherwise would have been worthy of the artist's name.

Passing from the buildings of the Grecian type to the style which gradually succeeded them, it is not strange that in the early years of our national culture there should have been many wonderful displays of utter ugliness. A building with a few pointed windows was taken as a specimen of a "Gothic Church." Then a great advancement was made when a tower, or a tower and spire were erected at an angle of the entrance gable. All the while the interiors were dealt with as their predecessors of the Greek type had been treated. The same blocking up of windows, and the utter recklessness of the peculiarities of the style, the commingling in one structure of windows of one age with buttresses and mouldings and columns of other ages, and many of these of no age—all these violations were displayed; but as it has already been observed, these things might have been expected, and they are far more excusable than equally flagrant mistakes which were made by builders in Great Britain who had all over the land the purest specimens of architectural works before them that the eye of the critic could examine. They had these gems, but it would seem that they actually did not see them; and thus an untaught and unreflecting class of mechanics succeeded in erecting a multitude of as absurdly constructed "Gothic" buildings as ignorance of style and want of taste could produce. Visitors from our land who have looked with delight on the gorgeous pile of the Houses of Parliament in London, would with difficulty believe that the architect of that National Senate House, had in the early years of his professional life produced some of the baldest and poorest specimens of stiff "would-be" Gothic churches which the early part of this century can show; yet this is well known to all in Manchester who are acquainted with the history of its churches. The last fifty

years, however, have witnessed an amazing progress. The efforts of Rickman and others to discriminate and classify the successive styles, the examination of the ancient examples everywhere to be found, the minute copies by students of all the details of columns, mouldings, bases, and capitals; the con-

CATHEDRAL OF ST. PETER AND ST. PAUL, PHILADELPHIA.

trasts of the members of one style with those of others, the study of the principles of construction, and the culture of that state of mind which enables the pupil to acquire "a feeling" for the peculiarities which belong to the different periods of the art; all these have united in producing a body of artists which were unknown in the previous age. Chief among the influences in this direction were the publications of the celebrated Pugin. His tendencies to extremes prevented him from being the eminently successful practical architect which otherwise he might have been, but his books of "Contrasts" were of inestimable value, and they

greatly affected the progress of art in his day. He presented a number of actual views of the ugliest buildings in different parts of the kingdom, and on the same sheet he showed by drawings the correct forms which these edifices might have displayed. He did this with gables, doors, windows,

ST. FRANCIS BAPTIST CHURCH, MOBILE, ALABAMA.

buttresses, and other members; he took a hideous looking entrance end of a chapel, with utterly tasteless decorations, and he showed by a picture what it might have been. He gave an angular view of a building which was supposed to have a specially ornamented front, while the side was bald, poor and *outré* in appearance, and by a "Contrast" he showed what *front* and *flank* might have been without any additional expense. In this manner his works became influential all over the country in cultivating the taste of the rising generation of builders, and at the present time there are very few leading professional men who would be guilty of mingling the members of different periods in the same edifice.

Where these matters are not understood they will not be appreciated; and many will no doubt contend that in churches about to be built, it is quite proper to block up windows by floors and stairs carried across them, and to put windows and buttresses of all kinds into the same building, because these things have been done from year to year in churches that are already built. It would be well if builders of such edifices would call their works by a proper name, for the time has fully come when there should be a recognition of the "hybrid" style.

It is easy to know when the study of architecture is only in an elemental state in any city, by the odd freaks and senseless things that artists attempt to introduce into their productions. For instance, any person who has ever seen an old fortified castle, or even the picture of one, must have an idea of the use of a machicolation. It was a parapet or gallery projecting from the upper part of the wall of a fortified house, castle or fort, supported by corbels or brackets, and perforated by openings in the lower part, through which destructive missiles might be cast down on an assailing force below. Consider then the thoughtlessness of an architect who would attempt to put such a structure on the top of a tower of a church, a house of peace, erected to promote gentleness and brotherly love. A fortification is one thing and should have all its parts, but a church is another thing and all its parts should be consistent with its churchly character. Suppose

further that from the angles of a church tower thus "ornamented" small circular turrets should be projected, supplied with narrow windows to enable the defenders to watch the enemy without or below, and over all, a grand angular lofty object, in place of an ordinary spire, should arise. To what style or period in architecture should such an edifice be assigned; and why should money be thus wasted in disfiguring a building?

An illustration in this paper will show the bearing of this criticism. The body of the church is an Italian style and the tower at an angle of the building is really an Italian Campanile; and yet on the top of this tower, the architect has placed a heavy machicolation, while above it there are

CHURCH OF THE HOLY TRINITY, NEW YORK CITY.

tial, and no features of any style whatever should be admitted that may mar the acoustic qualities of the edifice, or place a large part of the congregation behind obstructions that prevent the worshippers from seeing and hearing.

Now all these essentials may be secured, while a strict adherence to style is observed. It is only a matter of secondary importance as to the peculiar style that may in a particular case be adopted. Let it ever be kept in remembrance, however, that beauty does not mean lavish adornment and extravagant outlay; for on the other hand, many church edifices that are quite free from ornament are effective and striking, their great beauty arising from the harmony of their parts and the general outline of their plan. Whatever style may be adopted, keep to it, and avoid all mixtures. Avoid the common error of drawing a pretty picture for "a front" or "an exterior," irrespective of the internal necessities, and then offending by having the inside a series of ugly blunders. Should the size and requirements of a congregation render the

due regard must be paid to the capacities of the ordinary human voice. Thorough ventilation, combined with freedom from draughts are essen-

construction of a gallery in the church needful then let the plan both outside and inside be honest and consistent. It is an egregious mistake

to think, as many do, that Gothic buildings do not admit two ranges of windows, one range above another. Any one who has ever looked at Salisbury, or Ely, or Peterborough, knows to the contrary; and among the illustrations of this paper, there are two good examples which enforce this principle. Where galleries are required let the openings for light above and below be real windows of a distinct form and character.

Much has yet to be learned in church building, but it is a gratifying fact that during the last twenty years the progress of education has already beautified most of our cities with ecclesiastical edifices that are goodly monuments of the artists who designed and of the liberality of those whose munificence erected them.

It should ever be borne in mind that all designs in church architecture should combine symmetry of proportion with the greatest possible utility of the space occupied. This utilizing of room, while furnishing at the same time the necessary embellishments to inspire a feeling of awe and solemnity, is one of the surest tests of the artist's skill. The interior of buildings consecrated to the worship of God, while agreeing with the general exterior, should so blend

the majestic with grace of form, style and color of finish, as to awaken in mind and heart of the worshipper thoughts and emotions of a serene and exalted character.

ST. ANN'S CHURCH (EPISCOPAL), BROOKLYN, NEW YORK.

Want of taste in ecclesiastical structures is a serious impediment to lofty conceptions of the Great Architect, as it tends to distract the feelings, as discord in music mars the equanimity of the listener. The effect of the objects contemplated is, therefore, a subject of primary importance.

## THE AMAZONS OF MEXICO.

(FROM THE PEN OF A TOLTEC HISTORIAN.)

TRANSLATED BY ELIZABETH OAKES SMITH.

## CHAPTER II.

FOR awhile the women sat upon the ground with their heads bowed down, weeping, and casting their eyes upon the beautiful city which they should enter no more. There were their husbands and brothers—there were their fathers and their sons, friends of their youth, companions of their childhood. They were no more to behold them—death would be the penalty of their return. The lurid light from Popocatepetl shone upon their sad faces, and the everlasting stars looked placidly down, as they have done for thousands of years, aloof from human misery, regardless of the destinies of man. There was no omen of good, no sign of Divine displeasure. It is the fate of man to act, and the consequences of his doings haunt his footsteps with a perpetual, untiring tenacity, till the foregone has become a part of the ultimate. Yet does the great God consider it all, and what has tended to the good is folded into the fatherly bosom of the unseen.

As the night waned, the solemn multitude were gradually in the land of dreams, but the Lady Tula sat at the feet of Malinka holding her cold hands, but silent and motionless, for the Priestess was like to one sitting at the portals of death. She uttered no word, nor gave utterance to sobs—her eyes were raised heavenward, and a great agony of spirit, an inward cry of the whole soul went up in the face of the great God. She was responsible for all these women—at her word they had lost kindred and home. Had she been a blind leader of the blind? As this last thought pressed upon her mind, her whole being revolted; "No, no," she inwardly cried. "The vision was true as God is true. I could not, did not foresee this banishment. It has come upon us, and we submit."

The next day she expressed her mind to the women, of whom it is but just to say, they had not reviled nor reproached Malinka. She called upon them to bow down before that Invisible God, which had been a part of the worship of Cholula, and to whom no temples were ever raised.

"Alas!" they cried, "how can we worship! we have lost the sacred fire!"

"I am persuaded," answered the Priestess, "that we are called to worship, to power, to empire, and for these we must relinquish the past. We must build better than we have built, wiser than we have known."

She knelt down and in silence adored the Unseen, and all the women knelt, and not without many sobs and tears. Then Malinka, seeing the people obeyed her voice, as they always had done as a Priestess without considering whether it were wise and well to do so, bade them choose a leader, who should be a ruler, till such time as it was determined to build the walls of a city in which they might dwell. With one voice they called upon her to direct their movements. Then she bade them bring their gold and jewelry, and place it in the hands of the Lady Tula, reserving only such as they were in a habit of wearing for convenience as well as ornament. They willingly obeyed making this a treasure to be used as necessity might suggest.

"We must go south," suggested Malinka, "for there I have learned by the Priests of Cholula, the people are gentle, and the country most lovely. There we will build us a city; there will establish laws to govern us that shall not be of that cruel character under which we have groaned. Our marriages shall be our choice, not our necessity; our religion pure and without blood; our children shall no more be immolated upon the altars of a cruel god."

The women glanced at each other, and at last the Lady Tula asked, "You speak of marriage; you talk of our children; alas! how can these things be, unless we are lost amidst another people who will enforce their own laws, and compel us to submit?"

They were interrupted by the appearance of a group of the citizens of Cholula, who came to jeer and deride what seemed their hopeless lot; spies also had been around the camp, and Malinka saw that to avoid molestation, if not real danger, they must move onward. They did so by slow marches, indulging in the delicious fruits of the region, and

happy in a high purpose, though as yet its object was not clearly revealed to them. They were full of health, and animated by a beautiful if undefined hope. The wild beast did not molest them, and those of a gentle make allied themselves with them, and added to the magnitude as well as cheerfulness of the pilgrims. Bright birds flitted about them; chattering monkeys came and went, and the lama bent his pretty shoulders to the weight of the children and maidens. Even the snake, if venomous, forgot his malice and followed the peaceful troop, for the snake is attracted by women with child, and if not rudely repulsed, will fawn around her, impelled by a strange natural instinct. As they approached the confines of people through whose territory they must pass, splendid roads bordered with palm trees and the dark-leaved mahogany rendered their journey less toilsome. These nations offered them an asylum, but learning they went forth at the command of the beautiful god Quetzalcoatl, whose worship they in part comprehended, the men came forth and tackled their oxen to gorgeous chariots and helped them onward. Some of their nobler women joined them also. Sometimes the women rested for several weeks on their route, willing to learn of other nations their customs, their laws, and marriage obligations, in the hope they might profit by the experience of different people. Many children also were now added to their number; beautiful children were they all, but it was observable that the mothers who had borne boys looked upon them with sullen, unmaternal feelings. They will become men they said, and, though few in number, will assert their natural disposition to domineer over us. We have escaped one bondage only to be plunged into another.

Malinka mothered a lovely girl, and great was the rejoicing thereat. Her heart grew tender to the little ones who gathered about her as to a mother, and especially the little boys, who felt themselves unwelcome, and suffered from the displeasure of their mothers. They were less bold and less cheerful than the girls, and felt an unnatural isolation and constraint unless sheltered by the tenderness of Malinka.

Three years and more had passed since the exodus of the women from Cholula. They had travelled the great high roads of different nationalities which were paved with broad flat stones and the sides bordered with trees, whose dense foliage had

sheltered them from the heat of the sun and created a highway at once easy to travel and beautiful to the senses. They had now reached the country of the Toltecs, a gentle, civilized people, who, like the Aztecs, worshipped in the higher forms of their worship the Unseen, Eternal God, source of light and being, and of all moral ideas; but unlike the Aztecs, refused to offer human sacrifices to their inferior gods. They had been followed by messengers and spies from different nations throughout their route, but these perceiving them to be orderly, pious, and peaceful, and having no warriors, nor men of any kind, to create suspicion of their object, naturally supposed them to be destined to no remote destruction, and soon left them to their own way; often supplying them with many comforts and accelerating their departure through their territory, with an eye, doubtless, to the stability of their own women, who do not fail to denounce the actions of each other, while at the same time they follow the like doings themselves.

Not so the people of Palenqué, the chief city of the Toltecs, whose spies had warned them of the approach of this army of women for some time past. Being now within a day's march to the city, the principal men and high priests were sent upon an embassy to learn the object of such a strange movement of so many of the sex, usually detained within the precincts of their own dwellings. Seeing these dignitaries approach, Malinka sent to inform them that a deputation would meet them outside the camp, which they were desired not to enter.

It was observable that the little boys eyed these strangers with great interest; indeed, they gathered themselves upon the verge of the encampment, and it was plain to be seen that unwonted thoughts worked in their little brains, for they repulsed the girls that attempted to join them in their scrutiny, and grew more bold in their demeanor; from whence it may be inferred, that place the men in an inferior station, overcome by numbers, strength, or stratagem, they would gradually become the weaker sex, as these boys had become, and obey, where ordinarily they have ruled.

Malinka, clad in her white robes of office, her head bearing the symbol of a dove resting on the crest of a serpent, her arms ornamented with settings of emeralds and opals, and a silver wand with pearls of creamy lustre, symbolizing the purity of womanhood, in her hand; leaning upon

a golden staff, and followed by the Lady Tula and other noble matrons, separated themselves from the camp and proceeded to meet the envoys.

The chief men of Palenqué were amazed at the noble beauty of the women, the richness of their attire, as well as the superior intelligence depicted upon their faces. Awed by the majestic presence of Malinka, they knelt before her as to a divine representative. When she told them of the vision vouchsafed her by the benign Quetzalcoatl, and how he had directed them to the South, with a promise to further instruct them what to do, they saw at once she had been divinely commissioned, and departed with a promise to return the next day with further instructions from the authorities of the city.

Now the people of Palenqué were of an exceedingly polite and cultivated kind: their laws were just, their priests virtuous, and their wise men mingled freely with artisans and laborers, that they might impart to them the higher subjects of thought: the instructors of youth trained them to all the knowledge of the age in which they lived, including a study of the laws they were expected to obey, and those moral ideas which all are bound to respect; but it was noticeable that the women were less intelligent than the men. They had never been exposed to the sufferings of the women of Cholula, who upon slight pretexts were immured in the subterranean passages of the temples, from which they never afterwards emerged; they saw themselves and their children dragged into the temples, there to be sacrificed to the gods, and their sons, if beautiful in person, hidden by the priests to be at length laid upon the sacrificial stone. These things had driven them to despair, while the women of Palenqué, indulged in idleness and luxury, had sunk into imbecility, and were far less virtuous than the men, who greatly outnumbered them.

So it came to pass at the conference on the ensuing day, the rulers of Palenqué urged Malinka to take up her abode with them, offering to give up to her and her people the great palace, and to leave them uninterrupted in their own pursuits and opinions. This was a great concession, but Malinka, fearing a snare, proceeded to explain to them her real intent.

Accordingly, she summoned to the interview the young boys who loitered not far off, open-earred and open-mouthed. "These," said she,

"are of no use to us—they are not happy with us; we will give you these boys for a like number of girls." There were several hundred.

The men were astonished, but agreed there to thinking they had by far the best of the contract or bargain. Accordingly the next day the mothers of these boys departed, leading them by the hand, to the great grief of the little girls of a like age. At the same time from the city were led forth to meet their mothers the girls in exchange, and thus was the camp entirely free from the male sex, to the infinite delight of the women.

But for the most stringent restraints of the authorities, the whole male population of Palenqué would have emptied itself upon the camp of the women. Malinka, foreseeing this, no sooner was rid of the boys than she enrolled their mothers into a guard of soldiers with tight tunics, and helmets and spears tipped with polish absiding; rightly conjecturing that these women being naturally fierce in character and restive under restraint, would find their congenial element in any passage of arms. Nor was she mistaken; they at once organized themselves under their elected officers, and mounted guard, well braced in golden armor of delicate links, and weapons in hand. When, therefore, the Elders appeared for the third conference, they were met by this military body, which at once directed all stragglers back to Palenqué, while at the same time others stood guard over the circle of council. It will not seem strange that these grave, austere men, held in awe by all people, were somewhat moved and disturbed by the beauty of these soldiers, so intrepid and authoritative in manner, for men are dazzled by a woman's spirit, till it recoils, as it is apt to do upon themselves.

When Malinka had seated herself in this council, the elders explained the object of their coming.

"We perceive," said they, "that you are without men, and consequently will soon be extinct. Now, it is not the object of Quetzalcoatl, of whom we have also learned, to beguile you into the wilderness, there to perish. You are beautiful—more beautiful than any women we have ever beheld; you are wise, you are chaste, your voice is as the cooing of doves and the sighing of the wind amid the branches; why should you perish? We come to offer you a home in Palenqué, and a pick of our bravest and handsomest men."

A soft blush overspread the face of Malinka.

repeated upon the countenances of her ladies at these words, but she rose to

mistake the object of our movement. We seek new alliances of marriage. These proffered us before by people through history we have passed."

"It look too high," interrupted one of the little snappishly.

"To what we propose," replied Malinka. "We establish a new Empire."

Her half rose from his seat, while his jaw quivered. "Without men?" he ejaculated. Malinka blushed as before.

"Men and women cannot live together," she said. "They quarrel, they oppress, they corrupt."

At sight, the open-mouthed wonder of these ladies continued, "We propose, we

live together, to frame our own laws, to punish our own evil-doers, fight our own battles, to build our own cities, earn our own bread, and to dwell in our own temples."

When Malinka finished the last sentence, the eyes of the Elders rushed away from the speaker as if struck with sudden frenzy.

The Elders arose with great dignity, and in unison of voice, inquired, "Has Quetzalcoatl promised that you shall live a thousand years, and you may achieve all this?"

Responded Malinka, "we shall die as the rest of our sex have died, never having drunk the divine cup of freedom." She blushed again, and continued, "Our maidens are brave, industrious. We teach them the beauties of song as ye have heard, and are inspired by the harmonies of music. We hold festivals, when the youth of the other sex compete with us in all that is best in the world; in feats of arms, the language and music, the skill of agriculture, and the sciences of architecture. Then shall those youths, worthy of inspiring love, and fit for the duties of marriage, be united. We will not waste our equality, we will not waste the soul, nor will we, in the dull routine of everyday life. When the days of festival are over, the wife shall perform her duties with new honors, wearing the robes of marriage, and the husband shall do the duties of the other sex, and take up his accusations."

"Oh! ye gods!" cried one of the Elders, lifting his eyes upward in holy consternation. Another asked:

"To whom will the wife belong?"

"To whom will the husband belong?" asked Malinka.

"To his wife, to the State, to God."

"So shall it be with the wife. She shall belong to her husband in all loyalty—to the State whose laws she will obey, having helped to create them, and to God, whom she will worship. Thus does she stand as wife; but this relation is not for every woman. Marriage is not a position that every man and woman is fit to fill; therefore, over and above all else, every man and every woman belongs to himself.

The Elders groaned aloud. They glanced at the sunshine around the sky above, and then at each other as if fully expecting the earth to tremble with quakings. One of them at length asked, "Do you mean that women shall live by themselves, and men by themselves?"

"Assuredly. Every man is to do his own work; every woman to do hers. Love between them is to create the relation of marriage between them, a sacred and inviolable bond, but neither marriage, nor imbecility, nor laziness, nor property, shall bring one sex into bondage to the other. Each shall sustain itself."

"Ye gods!" again ejaculated the Elders, aghast at what they heard. The women soldiers laughed in glee, and rattled their weapons in mock defiance. The Elders asked:

"Where will it all lead? To what purpose should women cease to be helpful to man?"

"It will lead to peace, to justice, to purity. You have oppressed and enslaved us; you deride and condemn us; you say that all we do you can do better. So be it. We may not do well, but we will do that best suited to our conditions. If poor, it will be our own."

"You mean to turn the world upside down. I suppose as you admit marriage for some, there may be children; who is to care for them?"

"The mothers for one year will care for both sexes alike; at the end of that period, the boys will be delivered into the hands of their fathers, to be trained by them in all necessary knowledge, science, art, agriculture, and the true moral and religious principles. We in like manner will rear the girls to like pursuits and duties, and the faith-

fulness with which each party shall perform these duties, will be the test of our civilization."

"Do you mean that men must turn nursery maids to an army of babies?" cried the Elders; and at this the mirth of the women soldiers became nearly ungovernable, but Malinka waved her hand in token of silence, and replied:

"It is the result of marriage, and as thus each sex will bear its natural burden and responsibilities, each provide for its own prosperity and well being, the gods grant that every child may prove a girl!"

There was some tittering, and the council broke up without more ado, the Elders returning disconsolate to Palenqué.

In the meantime, day by day, the women most renowned for wisdom were organizing a body politic; choosing officers, and defining the rights and privileges of the community. There was some little difficulty in arranging the judiciary, as well as some other departments, the women not clearly recognizing the necessity of order and obedience to the divine element of justice. Not so with the soldiery. It would seem that women, like men, have a natural proclivity to battle and war, hence it became apparent that much of the discomfort which had hitherto existed in the domestic relation had its rise in this unacknowledged propensity in the sex; a propensity hitherto allowed no legitimate field for action, had expended itself in perpetual broils, irritations, and domineerings, greatly to the detriment of family peace and comfort. It is true the men had forced the women into the Temples, and by compelling them into the service of religion, had in a measure neutralized their ill-conditioned natures, but some were not to be in any way brought into harmony.

Now, however, these ferocious women being organized into military bands were in their own atmosphere, what might be called their normal condition, and great was their activity, their energy, their watchfulness. Women who had been thin and sour in aspect, all at once plumped up, and grew exceedingly handsome. They were resolute in enforcing discipline, and in practicing the accustomed drill of the soldier. Their bright eyes gleamed under the visor, and their closely-cut black hair imparted a sort of manly indifference to appearances, which is so much the besetting sin of women. Their dress consisted of a

was a tunic of white cotton edged with golden fringe. Over the armor was a short robe reaching to the knee and confined by a sash of blue, crimson, or gold according to the rank of the wearer. At the morning drill it was a fair sight, these slender, but shapely women in their rapid evolutions. It was found that a vast number of the sex belonged naturally to the military department, and therefore all were more or less trained to its duties, that in case of emergency they might not be without suitable defence. Indeed, it was found by thus enrolling the whole community, as it were, into a band of soldiers, whose exercises required force and severe discipline, not only was safety insured, but harmony also, as all surplus vitality in this way was consumed in a legitimate field. Private feuds disappeared, bickerings were done away with, rivalries ceased, and the women were content.

From the first exodus of the women from Cholula, they had declared the slaves free. No invidious distinction was allowed to exist. It was now formally announced that no slave should be known as such, in the body politic. Perfect equality was declared under the law. The ignorant women, the incapable women, were most especially under its protection. As to labor, each individual was at liberty to fix her status of industry, and avail herself of the aid of her sisters, so far as it could be done without creating a feeling of caste. It should be, not the duty, but the privilege of each to help the other. Work of every kind should be an honor, not a penalty. No woman should pride herself upon the whiteness of her hands, which would be rather a testimony to her laziness and incompetency than an element of beauty; the useless hand going with the imbecile brain. Every woman should be required to contribute her proportion to the common stock of industry and wealth.

Every woman shall be entitled to the use and possession of whatever is produced by her own industry, invention or discovery of any kind; but as the mere accumulation of property, without the design of some external, general good, is a selfish and degrading passion, unworthy of an elevated mind, she shall have the privilege of depositing her surplus earnings with the common stock, to be stored in a house built for the purpose, to be called the Treasury. No one shall draw anything from the Treasury, having once been deposited therein, without the consent of the whole.

woman is supposed to be willing to flaunt herself in foolish finery, thereby bringing upon herself the observation, if not envy, of her less well-to-do sisters. The beauty of person and harmony of life are best promoted by simplicity in dress and moderation in expenditure.

From time to time women shall present to the Community models for public or private dwellings, having studied the principles of architectural art, and these models shall be put into use as the increasing wealth and population of the Community shall require. Most especially shall they study beautiful forms of dwellings for the Marriage Bower.

Twenty persons shall constitute a group, who shall dine, and live, as it were, together. They shall embellish their houses according to their own taste, always cultivating vines and flowers about them. Their tables shall be ornamented with vases of flowers; every dish shall be garnished therewith, and as God has not scorned to give the most beautiful coloring to the humblest vegetable, woman must ever keep this æsthetic element always in view. At the appointed hour a few notes shall be sounded from a bugle, and immediately all the members of the various groups, suitably dressed and adorned with flowers, shall leave their rooms or vocations, and assemble in the dining-hall. Each group shall appoint its members in rotation, to superintend the requirements of the table. Before eating each one shall silently bless God for his goodness.

No woman shall neglect her person. Baths shall be attached to every dwelling. Neatness and taste in dress be absolutely required, as things desirable in themselves, but also as a worship of the great and adorable Spirit who has given us a body uncovered, thereby leaving human beings to the exercise of their reason to learn the fitness of things; and as all His works tend to the beautiful, so should His creatures keep this object always in view. More than this, women have hitherto dressed too much with an eye to the other sex, thereby having fostered a lower motive, such as vanity, rivalry, and sensuality; whereas a woman should study the highest art and fitness for their own sakes; representing the beautiful for its own sake, just as the lovely flowers bloom in desert places, content to belong to the unseen harmonies of a divine nature.

Members of the different groups will interchange

visits with each other, in which the utmost courtesy will be observed. As there will be no men, there will be no pretext for rivalry or jealousy of any kind, and an invariable sweetness, generosity, and friendliness will prevail. The women no longer young, will lay aside the glowing fervor becoming the young, and handsome in the dignity of their white hairs, shall become the guide of those who are passing the joyous but perilous period of youth. Their presence in the various groups shall be esteemed an honor and a privilege. They shall foster the purity of the maidens, instruct the wives, counsel the mothers, and insure the proper training of the children. The mature matron shall be esteemed as the best heritage of the community.

Music and poetry shall be cultivated by those whose mental bias may insure proficiency therein, while those devoid of this aptitude shall not waste themselves in idle endeavor, but devote their time and energies to that in which they are more likely to excel. There shall be once a month a public festival, in which music shall be a part of the entertainment, and the utterance and the recitations of poems which appeal to the nobler elements of the mind, such as courage, self-sacrifice, and devotion to the gods. Dancing also shall form a part of the festival, as being the poetry of motion. But, inasmuch as all these arts, except it may be poetry in a less degree, are sensuous in their nature, and calculated to undermine that constancy and fortitude of soul without which women are no better than sensual, dangerous syrens, these arts shall not become predominant in the community, and those who cultivate them do so at a certain peril. The woman writer of sensual, discordant, or what may be considered as poor verses, shall be excluded from the highest rank of honor till such period as she shall retrieve her poetry, or achieve excellence in some other department of honorable endeavor. The reason for this is, that poetry is the natural expression of women, and they must let the form of poetry alone, or achieve excellence therein.

It is believed that women do lie, and that to a terrible degree; but as this tendency arises from too much contact with the other sex, the evil will disappear when they, the women, learn to stand alone as it were, and judge moral questions from an abstract point of view. Women lie to conceal their doings from their husbands or male friends, whom they fear and strive to overreach. They

falsify to recommend themselves and to disparage others of the sex. They are vain and ostentatious from a like cause. Every woman desires to go ahead of every other woman, and if she cannot do it fairly, she will do it by undermining the other. Now this is not inherent to her, but proceeds from her state of dependence upon men, and her unconscious habit of seeing everything through his eyes, rather than her own; hence opinions and morals have been sexualized, and both men and women have been the worse for it. Candor is a godlike quality, which will be natural to women when all cause for rivalry is removed.

Envy and detraction will also disappear when women are left to themselves. Middle-aged, and even elderly women, are not ashamed to envy the freshness and beauty of the young, because these so largely obtain the favor of men, while the young detract from the merits of the mature in mind and superior in character from a like cause. Slander would be deprived of its sting if there were no men to listen and approve; indeed, without them it would hardly exist. Where women have a life in their own right, neither dictated to nor hindered by the opinions, prejudices, or dominations of the other sex, they will give hospitality to all the charms and virtues of each other. They will not form their estimate of others by hearsay. They will not cavil at differences of opinion, but where differences exist, examine the subject closely in order to reach the highest truth.

All the cities pertaining to enfranchised women shall be surrounded by a high wall, with towers at convenient distances, and sentinels shall guard the same at all hours, that surprise may be avoided, for so many wise and comely women congregated together are likely to tempt uncivilized barbarians to aggression, till the nations learn the wisdom and beauty of our institutions, when they will be adopted by all people. The treasury house shall be fastened with a strong lock; being the property of all, it shall be guarded by, and from all, till such times as the public business shall require it to be opened. No private house, room or casket, shall need the intervention of a lock, for the bare suspicion of dishonesty in one, would be a reproach to all. Where property confers no distinction, it does not tempt the cupidity of any; and moderate industry on the part of each, insures a competence to all.

Each city shall build in the centre of a great

square surrounded by trees, a noble Temple to the worship of the Supreme God. No Temple shall be built to inferior gods. The architecture of these temples, shall as much as in her lies, construct them in such a way, that on looking upward the worshipper shall forget that she is in a temple built by human hands, but shall seem to be under the shadowing of old woods, whose great branches athwart the light, shall flicker and tremble in the gorgeous rays of the life-giving sun, and be domed with the harmony of the overhanging skies.

There shall be no privileged priesthood, no solemn liturgy shall be observed, and the liturgy shall be ascriptions of praise more than the expression of desire, springing as they will from the pure and contented hearts. Every morning and evening sacred hymns shall be sung, and some of the women chosen shall discourse upon the lessons and duties of life, and dwell much upon the beautiful and higher existence of which the present state is a promise and prophecy.

Every child shall be carefully educated in the best attainable knowledge, according to its capacity to receive the same. It shall be taught to practice temperance, charity, fortitude and self-denial, distinguishing human qualities. Selfishness, pride, rage are to be checked, and such impulses turned into a better channel. No child shall be given a blow under any pretext whatever. Self-control shall be exacted, discourteous language forbidden. Women shall not only avoid what is offensive in speech and manner, but shall cultivate what is engaging and gentle in womanhood.

At the end of a year at the great festival, every male child shall be given over to the care of the father, with strict injunctions that his name and age shall be recorded, so that no incestuous marriages may ensue, and that he be trained to manly exercises, trained to all manly truths, to sobriety, trained to all the learning of the age in which he lives, trained to self-reliance, fortitude, contempt of danger, contempt for sensual indulgences. Trained also to a worship of God, to a belief in the eternal future, and thus shall the race of men be raised up worthy to be husbands to women who have become isolated, that more perfect unions may take place. Women and men shall be trained each to a higher humanity.

Girls, in like manner, must have their names and those of their parents, recorded in a p

register, which, with other documents, shall be kept in the great treasury house. From their earliest life they shall bathe in cold water. They shall fast at least once in the week, as well to bring eternal realities home to the mind and the worship of God as to ensure abstinence, temperance and self-control. They shall be taught to run, to leap, to be dexterous with the hand and perfect with the eye. Indolence and luxury alike to be avoided.

Women, whose qualities of mind incline them thereto, shall study the laws of health and the conditions of life, not because of disease, but as implying other and progressive states of being of which this life is only rudimentary. All women will be able to help each other in those emergencies incident to humanity, but which in a normal state are unaccompanied with pain. As much of disease, nervousness and ill conditions of every

kind arise from the too continuous contact with the other sex, their sensuality or brutality, unrestrained by more enlightened ideas on the part of women, they in their enfranchised and holier womanhood, will enjoy perpetual health, youth and beauty. A lovely exaltation will pervade their whole being, as though the morning stars sang together. Innumerable harmonies of being will be evolved, graces of manner and beauties of thought hitherto unknown. Disease will disappear, discontent no more prevail, the reign of peace be inaugurated, men and women be like the gods, for eventually the other sex will rejoice in their own enfranchisement, remembering that at first man was placed alone in his beautiful garden, and the bringing a woman there was an after-thought. It did not work well from the first, as Quetzalcoatl had revealed.

## THE SPECTRE OF SENECA LAKE.

BY DR. LAMOILLE.

SOME seventy years ago, the section of country surrounding that most beautiful sheet of water, Lake Seneca, in New York State, was just beginning to be settled.

At that time, scarcely half a century had elapsed since General Sullivan made his immortal march through the fair valleys of the Genesee country. Indians, though friendly, were still frequent visitors to their former haunts. Besides, there are well-authenticated statements upon record which lead to the belief that there was a lead mine near Watkins, and a salt spring near Havana; but the red men have kept their secret well, for the whites have never succeeded in finding these treasures. These villages are now universally known as the locations of two of the finest glens in the world; they have their tens of thousands of visitors annually.

Among the first settlers at Catherine's Town, which is still a post-station, were the writer's grandparents. Some boughs of their family tree still remain on the spot of its origin. Many incidents have I heard related at the fireside upon a winter's eve. The following "yarn" is merely a thread of one of these ravelings from the web of life in a by-gone and "heroic" age.

VOL. IX.—13

About sixty years ago, the dwellers upon the shores of the lake and its few mariners had frequent sights of a strange apparition. It seemed to be a tall, slim, dark-skinned man, with head looking down, arms folded tightly over a large cloak, and he appeared to walk upon the water.

The uncanny thing, whatever it was, seemed to be at the mercy of the winds and waves. It would be down by Geneva, at the foot of the lake one evening, and before next morning at Watkins, forty miles away, at the head of the lake. From the fact of its never being found twice in the same place, it was called the "Wandering Jew."

Some of the more poetical, or more ignorant of the whites, started a story that it was the ghost of one Jabez Lyon, a sailor who had been knocked overboard during a midnight tempest the preceding winter. By the way, this lake has some remarkable properties; one is that it never freezes in winter (two seasons ago, however, was the only exception known to that indispensable personage, the "oldest inhabitant"); the other, that whoever is drowned in the middle of the lake never rises to the surface. Thus, though Lyon's body was lost, his friends thought that his spirit had become somehow petrified, and so was still sailing the lake.

The Indians who once in a while visited the lake, declared that it was none but the form of their ancient chieftain, Colfilgo, who was a distant relative of Brandt or Thayendenaga, the generously-cruel Mohawk, execrable in Revolutionary annals. Colfilgo had been mortally wounded in the battle of Newtown, fought between the Indians and Sullivan's troops at a point upon the Chemung River near where the flourishing city of Elmira now stands. Colfilgo, rather than be taken prisoner by the victorious whites, sung his death-song, then threw himself into the lake, and was drowned at a ledge of rocks near Hector Falls.

One summer afternoon four hunters came to a settler's cabin, on the eastern side of the lake. In a little while, two of them went after deer. An hour later the others also started for the hunt. In a narrow inlet near the house, they saw this sort of a spectre floating, buffeted by the waves. The hunters cried:

"Oh! there's the 'Wandering Jew!' Let's put him out of his misery!"

Accordingly, one shot his rifle, and hit the mysterious object. His companion then fired, but his shot was quite unfortunate. Over in the opposite thicket, a man jumped into the air and fell dead. The hunter's stray bullet had killed one of his friends who chanced to be there, watching a deer near by which was coming down to the beach to drink. How true that "in the midst of life, we are in death!"

After this melancholy day the spectre was more than ever shunned. It could not be learned whether anybody had examined it or had even been near enough to tell exactly what it was. In less than two years the harmless spectre had (in one sense of the word) many diabolical intentions forcibly tied to its tail, like a homeless dog is familiar with old tin-pans.

One winter's night, a truly awful tempest raged about that section, and the lake had its full share. Each one of the craft upon it had made good harbor, save the staunch schooner, the *Allie*, having on board the "noblest Roman of them all," Mr. Lattin, skipper, two other men and a boy. One of the crew was a negro named Stone, but commonly called "Pete Nig."

During one of the flashes of lightning the crew saw the "Wandering Jew" about ten fathoms from their bow, bearing down upon them.

"Pete Nig" was very superstitious, and the spectre scared him so, he lost his presence of mind and a sudden mighty sea swept the decks, and he was washed overboard. Another flash allowed his shipmates to see him meet his enemy; they grappled, then all was dark once more. They were never seen again.

Once upon a time, I was sketching near Starkay. During an interval of rest, while slowly walking along the beach, I saw in the sand and gravel a piece of bone, which my medical knowledge told me was a human "right" *tibia* of the African type. Considerably surprised, I searched and found I had made an important discovery. Wishing to have the skeleton for my own private collection of anatomical curiosities, and being desirous of avoiding all scandal, I covered up my "find" and told nobody about it.

At the noon of night, when unladen ghosts are said to arise, I reached my treasure-trove. It was there; therefore the old saying about the movements of ghosts is quite wrong. Working briskly for about ten minutes, I found a negro's skeleton, tolerably well preserved. It was in close contact with a section of a maple-tree whose roots clasped a large stone.

I had heard about the spectre of the lake, and the drowning of the negro. I supposed that the corpse, clinging to the tree, was washed ashore and buried in the beach by the tempest, where it had lain undisturbed till I found it by chance.

I half dreaded to strike a match, but I did so, and, surely enough, I saw the ancient terror of the lake. The marks of a sharp axe were still visible upon it, showing how somebody had once rudely and fancifully carved it into a sort of a caricature of a man; it was so balanced that it would stay just about so, and seem to walk upon the surface of the rolling waves.

Dear reader, if you should ever visit my office, you will see the old darkey's skeleton behind that black curtain over in the cabinet. I suppose my neighbors will now stop wondering where and how I got the quaint piece of timber and the big stone, which chiefly ornament my back yard.

The Society of Antiquarians is quite welcome to the historical information conveyed in this story, which is founded upon facts.

## A COURT DAY IN THE MORLACH COUNTRY.

By W. W. CRANE.

THE Morlachs, or mountaineers of Dalmatia, are so closely connected in every way with their kindred of Bosnia and Herzegovina that they have lately received an unusual degree of attention from the world at large. Many of them have, in spite of the vigilance of the Austrian officials, taken an active part in the late insurrection, and are reported to have rendered good service in the actions against the Turkish forces. Their limited intercourse with the rest of Europe has prevented a general familiarity with their character and manner of life; but these are, in themselves, remarkable enough to deserve special attention.

The open space before the "Circuit Court" in the little town of Sign, high up in the Dalmatian mountains, presented, on a "court day," a scene of the utmost confusion. Men, women, children, horses, fowls, asses and sheep, were huddled together in a mass before the steps which led to the rooms of the circuit judge. The constable, with his staff, debarred all entrance to this abode of justice; for the *udienza*, or hearing, did not begin until nine o'clock.

At the present day in Dalmatia, the separation between the political and judicial authorities is as complete as elsewhere throughout Austria. But at the time referred to the Prætor was both judge and governor of his district, and Sign was the abode of such an officer. This suited the taste of the Morlachs better than the present arrangement. It corresponded closely to that prevailing in Bosnia to-day; and, bitterly as the Morlach hates the Turks, yet Turkish customs are more congenial to his half-savage nature than those of Western Europe. As the Prætor was thus practically irresponsible, he might, at will, enact either the Turkish pasha or the Slavic patriarch. Consequently he was held in great respect, and his decisions were received with the same submissive obedience which attends those given by the *Mudir* among their Turkish neighbors.

Shortly before this court day three boundary stones in the neighboring village of Wucenowicz had been removed from their proper places. This had caused a violent quarrel between the men who claimed the two fields which these stones

separated; one of them claiming that he had been defrauded of his rights by the removal, and the other denying that any wrong had been committed. There was, in this case, an attendant circumstance which rendered the matter especially difficult to settle. This was the important fact that, in reality, neither of the contestants owned any of the land in dispute. Both fields had shortly before been barren, stony plains, belonging to the State. Each of the present claimants had redeemed a portion of this waste land by hard labor, removing the stones and cultivating the soil. In the course of time their "improvements" met each other, and then they marked the boundary line between their estates with the stones before mentioned. The quarrel which arose when these had been displaced could not be settled by either the priest or the *Harambasha* (local magistrate); and when it had gone so far that there was imminent danger of its being terminated by a pistol shot or a slash with a hanger, nothing was left to do except to refer it to the Prætor. Accordingly the two incensed Morlachs of Wucenowicz were induced to set off at different hours—for fear of a collision in the village—accompanied by their respective wives and children and certain of their domestic animals, to seek justice at the hands of the "*Gospodine* (Lord) *Prætor*," and these formed part of the motley crowd in front of his dwelling.

On the stroke of nine the constable allowed the people to enter the outer room of the house. But as each man went in he was required to give up his gun, a long, flint-lock musket, his pistols, hanger, and any other weapons he might carry.

While waiting in the outer room the men slowly unwind their turbans, so that they may easily remove their little red caps when in the presence of the Prætor. Then they seat themselves on the circular stone bench which the room contains, and smoke their chibouks; for these indispensable articles are not left behind even on such an occasion as this. Meanwhile the women, who have brought their primitive implements for spinning, occupy themselves with that labor.

Soon the door of the inner room is opened, and

the constable calls out, "Mate Wucenowicz!" Two huge, burly Morlachs rise simultaneously, and answer, "*Ewo!*" (Here).

The constable glances at the piece of paper he holds in his hand, and then calls again, "Mate Wucenowicz, son of Ilia!"

Again answer the two sonorous voices, "*Ewo!*"

Both the respondents are inhabitants of the village of Wucenowicz, both are named Mate, (Matthias), and both their fathers were named Ilia (Elias). It is a peculiar case; but the constable is equal to the emergency. He now cries, "Mate Wucenowicz, son of Ilia, son of Ante!" To this scriptural sounding citation only one of the couple respond, and he is led into the Prætor's room. The latter has on a uniform frock-coat, and wears a black silk cap on his head. Consequently the chances are that he is more the patriarch than the pasha. And his reception of the plaintiff in the case confirms this probability; for he claps him heartily on the shoulder and inquires good-naturedly about his harvest prospects. Mate Wucenowicz, son of Ilia, son of Ante, is much honored by this friendly treatment, and concludes that a Prætor who shows himself to be so very approachable cannot fail to see that he shall receive strict justice. So he sticks the stem of his chibouk between his shirt collar and the nape of his neck, letting the bowl display itself over his half-shaved head like a token of his truthfulness, and begins to set forth his case. The Prætor listens patiently, and agrees to his propositions with gratifying regularity. When he has done speaking the door is again opened, and this time the constable calls, "Mate Wucenowicz, son of Ilia, son of Pave!" (Paul).

The reception of this second Mate is exactly like that accorded to his antagonist; and he too, argues therefrom that the "Gospodine Prætor," who, as in the other case, agrees amicably to everything he says, cannot fail to do him right. So far everything has been peaceful and friendly. But now the first Mate begins answering the second, and immediately both voices are raised to their highest pitch, and the windows rattle amid the stunning din. Any one not acquainted with such scenes—as the Prætor unquestionably is—would think that bloodshed must certainly ensue. And indeed, such a termination to the dispute would not be at all unlikely were it not for the fact that

the constable has been careful to take the weapons of both into his possession at the outer door.

Each disputant declares, with the most terrific curses, that he can solemnly swear to the truth of what he has stated. Each utters such threats against the other as would ordinarily be accompanied by the sound of pistol-shots and the flash of knives.

In the height of the stormy discussion the Prætor interferes.

"To whom did the field belong before either of you cultivated it?" he asks.

Both Mates hang down their heads until the short, stiff pigtailed in which the "back hair" of each is arranged stick outward and upward.

"I think you may as well let the boundary-stones stay where they are," continues the Prætor. "And now, if you don't both go home peacefully and quietly, we'll take measures to find out who really owns the land you are quarreling over."

"*Brate*" (brother), says the grandson of Ante, to the other, after a short pause, "are you willing to make peace? I'll give a lamb, and you'll furnish the wine. Will you do it?"

"*Brate*, you are right," answers the descendant of Pave.

Then they embrace each other, give each other resounding kisses, and are impelled by their joy and hilarity to extend their affectionate demonstrations to the person of the Prætor; but that functionary avoids the impending osculations by retreating behind his table.

"*Falavi, falavi, Gospodine Prætor!*" (Thanks, thanks, Lord Prætor), they both cry; and then, with many awkward bows, they pass into the other room.

Now comes an after-piece. The wives of the two Mates fling themselves ecstatically into the Prætor's presence. Each carries a basket of eggs in her hand, and each drags a bleating sheep after her by means of a cord. These they wish to present to the judge as compensation for his decision, and they have brought them to the court for that purpose. But the Prætor declines the proffered reward, and women, eggs, and sheep are put out of the room together.

So the boundary-stones remain where they are; and on the succeeding day a great feast is given in Wucenowicz by Mate, son of Ilia, son of Ante, and Mate, son of Ilia, son of Pave.

## THE PUZZLE OF PHILOSOPHERS.

By W. C. C.

THE cosmogony of the world has puzzled the greatest philosophers. Such was the sagacious remark of Jenkinson in the "Vicar of Wakefield." Had the charlatan lived in the present day, he might have made the same observation. In a hundred years we have hardly got nearer the truth on the subject. The notions about the age of our globe are considerably changed, still nothing is determined with certainty. If any one wishes to see how the battle of the cosmogony stands, and who are the contending parties in the struggle, we recommend the perusal of an article, "Modern Philosophers on the Probable Age of the World," in the *Quarterly Review*. It is thoughtful, lucid, and scientific—not perhaps what every one will agree with, but presenting a fair exposition of the latest phase of the discussion.

The ordinary chronology which assigns some six thousand years to the age of the globe, or, properly speaking, the date of creation, is set aside as untenable, because demonstrably not only at variance with historic and archæological research, but with the substantial discoveries of geology. The leading fact dwelt on is, that in all the grand operations of Nature, God works by a "process of slow development—by means beautifully simple, and involving no violence, and no haste, yet irresistible." On this basis some millions of years must have elapsed since the earth came into being. "Modern English geology holds that all geological changes have been effected by agents now in operation, and that those agents have been working silently at the same rate in all past time; that the great changes of the earth's crust were produced, not by great convulsions and cataclysms of Nature, but by the ordinary agencies of rain, snow, frost, ice, and chemical action." The rising of the ground at one part and the sinking at another is familiarly known, and so are the encroachments and recessions of the sea. Torrents wear away hillsides, and excavate ravines and valleys. All that goes on before our eyes, and no one entertains any doubt about it. The question substantially is, how long have the changes been in operation?

This brings us to the view held on the one hand by geologists, and on the other by professors of

mathematics and physical science. These latter assert that the sun and the earth, in fact the whole solar system, cannot, from their physical condition, have existed for the enormous length of time claimed by the geologists. "The principal grounds," says the reviewer, "upon which scientific opinion has recently declared itself in favor of limited periods for the duration of the solar system are based, first, on the belief that the earth is cooling, if not rapidly, at such a rate as to make it impossible that it should have existed for very many millions of years; secondly, because there is reason to believe that the earth is not now rotating on her axis with the same rapidity as in former ages; . . . thirdly, because the sun is parting with caloric at such a rate as to make it certain that he could not have continued to radiate heat at the same rate for more than a few millions of years; and lastly, because the changes in the earth's crust, stupendous and varied as they are, could have been, and probably were, accomplished in the course of much shorter periods than popular geology has hitherto considered possible."

The inquiry as to the date of creation must, it is said, be distinctly limited to members of the solar system. That system floats in space by itself; has nothing to do with the stars, the nearest of which to us is two hundred millions of millions of miles distant—a distance so great as to be beyond human comprehension; and if we conjecture that there are still stars far beyond out of sight, we are lost in the infinitude of space. To keep to the solar system, which is all we can do, it is a group of bodies whirling in solitude, and sustained and regulated by certain distinct laws of gravity impressed by the Creator, and inherent in matter. But how was the solar system set a-going? How was it produced? Here we are referred to the operations of Sir William Herschel, whose discoveries with his large telescopes have been lately published. Herschel, it has been stated, swept the heavens for nebulae, that is to say, light cloudy matter, which he imagined to be the rudiments of new suns and new worlds. This was in 1779, and his ideas were afterwards elaborated by Laplace. The idea was stupendous. Herschel, assisted by

that wonderful being his sister Caroline, discovered enormous numbers of *nebulae* "in every part of the heavens, and apparently in every stage of progressive development." He classified these *nebulae* according to the stage of growth at which they had arrived. Some were very thin and vapory, others were more dense and milky in appearance, and finally they seemed to possess a central nucleus, "nearly approaching the appearance of stars." There, as was believed, was exhibited the growth of solar systems under the creative hand of the Almighty. In time, the matter thickens, and overpowered by the attraction of gravity, the nebular mass rushes to a centre with concentric rings. These rings break off as planets. "As each planet was in turn cast off, the central mass contracted itself within the orbit of that last formed, and formed the sun." Such is the theory of Laplace. Well, but what of the sun's light and heat? On this point the explanation offered by the writer of the article in question is based on a scientific principle not usually thought of. Heat and force are convertible terms. The concussion of two or more hard substances produces heat, and extreme heat produces light. "If the particles of a vast vaporous mass were brought into collision from the effect of their mutual attraction, intense heat would ensue. The amount of caloric generated by the arrest of the converging motion of a nebula like the solar system would be sufficient to fuse the whole into one mass and store up a reserve of solar heat for millions of years." If that conjecture—for it can be nothing more—be correct, the mystery of the sun's light and heat is explained.

Another principle in physics is little thought of. The sun's heat is susceptible of being stored up for the use of man. How that should be is curious. The rays of the sun nourish the growth of trees; forests of trees are overwhelmed by geological changes, and, pressed into a hard mass under newly formed strata of sand, assume in course of ages the form of coal. The coal is dug, and being burnt, gives out the heat which was received from the sun. In sitting round a coal-fire, we are warmed by the sun's heat which was diffused on the surface of our planet millions of years ago. In other words, when we buy coal, we are buying a quantity of stored-up sun's heat. We speak of forests being metamorphosed into coal millions of years since, but the period is vague as well as various. Forests of mature growth have been

submerged. On the upper stratum of land over the spot, fresh forests have flourished and been submerged in turn. The process has been repeated several times, and all we can really say with certainty is that the different layers of coal have been produced by successive submergings over a very long period of time. These facts concerning the origin of coal are amusingly illustrated in the "Life of George Stephenson." On one occasion, when George was at Drayton Manor, the seat of Robert Peel, he said to Dr. Buckland: "Can you tell me what is the power that is driving that railway train?" "Well," said the other, "I suppose it is one of your big engines." "But what drives the engine?" "Oh, very likely a canny Newcastle driver." "What do you say to the light of the sun?" "How can that be?" asked the doctor. "It is nothing else," said the engineer; "it is light bottled up in the earth for tens of thousands of years—light, absorbed by plants and vegetables, being necessary for the condensation of carbon during the process of their growth, if it be not carbon in another form—and now, after being buried in the earth for long ages in fields of coal, that latent light is again brought forth and liberated, made to work, as in that locomotive, for great human purposes." As is observed by Stephenson's biographer, "the idea was certainly a most striking and original one: like a flash of light, it illuminated in an instant an entire field of science."

Reverting to the difference of opinion between Sir Charles Lyell with other geologists and that of the mathematicians regarding the age of the world, the reviewer, speaking geologically, sums up by saying: "It is eighty millions of years since the lower tertiary formation, one hundred and sixty millions since the formation of the coal-measures, and two hundred and forty millions since the beginning of the Cambrian period! And beyond that inconceivable antiquity lie the whole range of the primary rocks which contain no fossils;" adding, that "Mr. Darwin assigns to the world even a greater age." We confess that all this looks like vague speculation; and who knows but some fresh inquirers a few years hence may upset the notions now so authoritatively advanced. Great periods of time have no doubt to be allowed for, but it would be well to be cautious in fixing these periods with precision.

Any calculations regarding the age of our planet

would require, as is said, to be modified by the fact of a gradual retardation of the earth's diurnal rotation. It is alleged there is a retardation in consequence of the daily tidal waves, so that "the standards by which we measure time are less precise as we recede further into the past. . . . As Professor Tait puts it, the earth has always to revolve within a friction brake. Adams adopted this theory of tidal friction; and in conjunction with Professor Tait and Sir William Thomson, assigned twenty-two seconds per century as the error by which the earth would in the course of a century get behind a perfectly constructed clock (if such a machine were possible)." It would require much more conclusive reasoning than this

to prove that the movements of our planet are getting out of order. Nothing in nature seems so marvelous in creative wisdom as the prodigious accuracy of the earth's diurnal revolution, which year after year may be reckoned on to an instant of time. Leaving the reader, if he pleases, to pursue the subject in the article referred to, we can only say that the theories propounded are eminently suggestive, but nothing more. It is not remarkable that there should be differences of opinion among men of science concerning the dark and stupendous questions of the cosmogony of the world. All we deprecate, in the present state of human knowledge, is rash dogmatizing one way or another.

## DEERFIELD—OLD AND NEW.

BY ELMER LYNND.

WHEN a neophyte in history there were two or three facts that stood out distinctly in my memory and imagination, and I seemed almost to live, myself, in the events recorded on my mind.

One of these events was the slaughter of the poor little Princes in the Tower; their sad, pleading faces being almost sufficient, it would seem, to disarm even Satan himself.

Another event was the murder of Miss Jane McCree by the Indians; and a third, the Indian Massacre at Deerfield.

The Indians were the dread of my childhood, and although I lived in a thriving village not far from a large city, yet I was frequently in terror for fear the savages would rush in and tomahawk all the inhabitants as they had murdered those of Deerfield one hundred and fifty years before.

Old Deerfield! It never seemed to me like a place that I should come in contact with any more than Kenilworth and Holyrood. And yet I did visit Deerfield, and found it a dream of beauty, its broad street showing no marks of the ruthless invaders, its placid Connecticut bearing no stain of blood on its pure waters.

Through the glowing description of a friend we had wandered to a village a few miles from Deerfield, also on the Connecticut, and there we unstrapped our trunks and prepared to linger for a few weeks.

We were situated so conveniently for intercourse with several villages of note in the Connecticut Valley, and we gleaned so much that was delightful and interesting concerning them, that we have been living on the memory ever since.

We had travelled in every direction from our headquarters; had seen the wonderful sandstones from the Connecticut Valley with their mammoth footprints; had interviewed the seat of learning and agriculture, but had left Deerfield to the last.

We had read about it, and dreamed about it, and talked about it, until our good farmer and his wife doubtless wished it at the bottom of the Connecticut River. And the former, with a quid of tobacco of his own raising expanding his cheek unnaturally, tried to dampen our enthusiasm by saying that "Deerfield weren't much of a place nohow."

Then discretion did not have the better part of valor, for we rushed into history like one distracted, and spoke up for Deerfield as if we had lived there all our days—in fact as if we had been the first settlers in its sacred precincts.

The day arrived for us to start. We had arranged everything to our satisfaction with the boyish proprietor of the hotel to whom we applied for that indispensable article in the country, "a team." He included himself in the compact, and agreed to drive us over.

So after dinner he appeared, remarkably spruced

up, and with his company manners on, and we set forth on our little journey.

We met with no adventures on the road. We did our country duty faithfully, bowing to every one we passed, according to custom. It was a lovely hazy August afternoon, just the kind of a day you feel as if you could keep on and on way up to the clouds, if the laws of gravitation did not have to be defied. The golden grain was ripe but had not been gathered, though farmers were busy here and there in the fields, in their shirt-sleeves as usual.

Our first call in Deerfield was made at a house that proved to be a perfect mine of curiosities and information. The president or treasurer of the embryo historical society was the host, and gave us a most cordial invitation to enter. The house was old and the furniture was old, but that in our eyes was its chief attraction. We spent a delightful hour examining the quaint old books, and the various relics of Indian days. Besides the spear and arrow heads, Indian beads and wampum, we were shown the Indian deed which surrendered Deerfield into the hands of the "Tang-hese." Old Mount Tobey, which rose so grandly above the village, was called by its Indian owners "Wee Wah." The deed was signed with the usual amount of ominous looking arrows, turtles, birds, etc., these various hieroglyphics belonging to different chiefs.

From this fascinating mansion we drove to the hotel, also on the main street, in the hall of which, protected from desecration by a glass case, stands the door of the old fort, which was the only building that remained when the rest of the village was laid in ashes. This rough looking door, made of huge planks, bears fearful looking cuts and slashes, marks of the tomahawks, each one of which must have sent a blow to the hearts of the women and children gathered there for safety.

I could picture as I gazed at this old relic, the quiet sleeping village in the early morning, when

the weary sentinels had given way to exhausted nature, little suspecting that the savage foe was so nigh. I could almost see the pale moonlight on the newly fallen snow so deep that it reached the top of the palisades, over which the French and Indians easily marched into the town.

I could almost hear the terrible cries of the bewildered inhabitants, threatened with instant death from the flames or the cruel hatchets of the invaders.

Led on by Hertel de Rouville, his band of two hundred Canadians and one hundred and fifty Indians were ready for any foul work.

About fifty of the villagers were killed and one hundred prisoners were secured, and most of them taken to Canada. Among the prisoners were the Rev. John Williams and wife, with their children. The youngest was an infant a few days old, and this was ruthlessly destroyed before its mother's eyes, and afterward when her small supply of strength gave way they killed her and left her lying on the pure snow, while they continued their journey. Subsequently, the few neighbors who were protected in the fort, came and carried her remains to their last resting-place.

Before setting out for home we wended our way to the old burying-ground where some of the first settlers were laid. It is a forsaken-looking place, a little out of the village, and all overgrown with rank grass. It is also full of pitfalls, and in our haste to reach the graves of the historic John Williams, and his "Consort Eunice," as the stone reads, we came very near being precipitated into more than one of them.

How lonely and uncared for those graves looked! Only the tall grass and a poor ragged looking cedar tree that stood near, afforded either of them any protection from the smiting summer sun or the fierce winter wind. Not even wild flowers grew in this desolate spot, so we broke off a few pieces of cedar and gathered some of the grass to lay on those two mounds as a sort of benediction.

## WAITING.

WAITING! For what? Shall I ever know?

Or shall the new years creep drowsily by

And I shall never know why

Life of woe?

Is the whole of my lifetime merely a pause

'Twixt my birth that was, and my death to be?

Must I always follow, and never be free?

Am I only effect? Can I never be cause?

## THE FAIR PATRIOT OF THE REVOLUTION.

BY DAVID MURDOCH.

## CHAPTER XXXIV.—THE RESTLESS SPIRIT.

TEUNIS wandered down the hollow for at least forty rods. He sought to cool his brain, which was burning with what he had witnessed, and he wished to collect his thoughts before he ventured into the presence of the man of whom the whole country were in wonder concerning. As he turned his face back toward the cabin door, he was suddenly seized from behind by two men, who proved to be the Indian Kiskataam and his follower, who had been seeking for his chance since he was in his brother Anthony's tent. One of them closed upon his arms, while the other put a hopple round his ankle, thus preventing him from resisting or running. A cloth bound over his mouth prevented his call for help. By signs not to be mistaken he was directed to pass the hermit's door; when Teunis perceived that fear of the inmate held his captors in check. All at once the words of the recluse came into his mind, "In trouble sound this whistle." Suddenly drawing his hand out of the bandage, he seized the pebble, and gave it a shrill call, that made the wilds resound. The Indians, surprised, found the terrible man before their face ere they were aware of it, with old Dora and the dwarf in the rear. Torches of pitch pine showed the state of affairs to the relief of the captive. The captors, finding themselves so unexpectedly caught, fled, leaving their prisoner in the hands of his deliverers. Great was the joy of old Dora over her favorite white boy, and the virtue of the black pebble, and as they entered within the abode of mystery, many a strange motion was made by the black enchantress before the wizard.

Teunis, when he recovered himself, was in the presence of the man whom he had seen before—the man with the long beard, the high cap, the robe of figured blue, the bent body, with a staff in his hand of at least seven feet in length. The captain, with whom the Dominie had been debating, was not there. A superstitious feeling, swelled through the young man's breast like the tide at full moon. His first impulse was to run after the Dominie and the captain, but that was impossible with Dora there at the door, and the

dwarf at her side, while the hermit sat before the ruddy fire, stroking his beard and pointing Teunis to a seat.

"Dora may go on her errand," said the grim man, "and let her be sure that she leaves one of these sets of garments at the bear's cave, and the other at the south side of the big falls."

The old creature came forward at that, and laid down the crystal cup which Teunis had seen in her hand before, on the tripod in the centre of the room; she was careful to have it stand immediately beneath a lamp which hung from the roof, and Teunis just observed for the first time that the lamp was the same in size, in pattern, as well as material, with the mysterious cup.

"Teunis Roe," said the Solitary, soon after the door was shut, "you are in trouble; you are seeking those you cannot find. Your mind is divided, and how can any one obtain what his thoughts are not fixed upon! What seek you here at this hour of the night, when the very ravens, the wild-cats, and the panthers are all in bed, and no one prowling round but the tigers of humanity?"

"If I may venture to speak," said the young man, trembling from head to foot at first, but gradually recovering himself, "the man who asks of me what I am seeking, knows more of my affairs than I do myself; and so I ask at once, where is Elsie Schuyler? Is she in bondage?"

"These are the questions which every one has not the right to put; nor have all the right to intrude upon the privacy of that noble-hearted damsel. I may not answer in words. Look into that cup. Lift it in your hand; it is the cup of the famous Begu of Moorshedabad that he called Alinagore, the gate of God; and his spirit is ever present when the like-minded gaze within its sacred walls."

Teunis, sincerely afraid that he was dealing with the devil, and yet anxious to have an answer to his question, felt a wavering in his mind at first, but his reverence for the necromancer had diminished somewhat since he saw that Dora and he had some participation in the same things. Had he known less of Dora, he would have had

more fear of the recluse, but having been behind the scenes with her in part, he had but a partial hold on his imagination. Still, to make himself safe against all the power of the evil one, he said the Creed secretly to himself, with the grace before meat in mistake for another prayer he was inwardly gathering up. The sides and bottom of the cup were bright and shining, and seemed, or really did, send forth the pictures of living beings, who were seen moving around in the midst of scenes wild and beautiful. The gazer looked till his head swam in confusion, eagerly looking, yet not distinctly comprehending the objects before him. He was about to return the goblet when a side glance at one of the figures discovered to him the well-known outline of Elsie; and then of Angelica's profile, and even Rover came before him at last; with another form he could not distinguish sufficiently plain. The natural scene in which they were grouped was familiar to his eye; but the more doors unlocked in the halls of his memory, the more confused he became. This was all the more tormenting, for it seemed that Elsie looked right into his face, and was holding up her hand in an imploring attitude.

"For the love of God," said Teunis, in a transport of passion, "tell me where that place is, that I may run and help her for whom I would give my life at any moment. I see that she is in danger, and every instant is worth a world to me."

"Shake the gate of God, and it will open if your spirit be in harmony with truth and justice; we know already that love is in the ascendant; but it is the symmetrical soul alone which angels admire, and for whom they will unfold the doors of paradise."

During this brief homily the cup-bearer had shaken it, and was gazing intently down into the bottom where he saw figures of men in crowds, as if fiercely contending. Figures which he could have taken to be those of persons whom he knew and feared; but all was so dark and interesting to him that he durst not define too closely, though he could not help catching glimmering hints. He was satisfied that the mysterious man before him knew more than he did himself; and that the shadows he was showing him were intended to excite in him feelings of curiosity, which maddened him rather than gratified his desire.

"You mock me, whatever you be, wizard, witch or spook," said Teunis, flinging down the

goblet with a ring that startled himself more than it did the necromancer. "You show me that Elsie Schuyler is in danger, and leave me in the dark. No good man could be so cruel."

"Shake the cup not in wrath, for anger never gained heart, hand or heaven," said the gloomy recluse, half smiling at the violence of the youth.

Teunis looked again, and after patience he saw a gay group surrounding a pair equally gay. All was sunshine. In the distance was a church, where offerings of praise went up from the assembly, and to the right was a ship in full sail with streamers flying in the wind; the grandeur of nature, spread out before the eye, seemed to be hallowed with the incense of heaven. The scene on the opposite side was one of death and of blood. But scarcely had the curious gazer looked understandingly on the pictures than the hunting-watch of the hermit struck ONE, and then, as if by real magic, the divining cup was dark and meaningless.

Teunis started at the sight of vacancy, and shook the goblet furiously in the hope of restoring the vision.

"Only three times, young man, and never after the short hour. The spirit has returned to his place."

"Good sir," said Teunis, now anxious to see more, "let me but finish the vision. I have come for counsel, and must know the place I am standing upon before I can act."

"You must act, young man, without knowing all things. We have but glimpses of realities in this world. Faith must guide us through darkness. You have seen enough to warn you of duty. Heaven leaves us no choice of duties. There is danger near the one you love. Be on the alert, and the time to act is at hand. There is blood on the road to life. To-morrow at noon, by the Dog Pool, and let your new friends be with you, for we shall have a sacrifice there, sending up a fragrance and a smoke that shall be seen from the bay of Manhattan to the shores of Erie."

With these words, the strange man held out a cup of the good Santa Cruz, which Teunis might have shrunk from receiving from the hand of a wizard, had he not lately heard its praises given, and its pith proved by the man whose word he had never once questioned; so without a scruple he drank the whole. He left the cabin in much the same kind of feeling which a somnambulist

has when he rises out of bed into dense darkness, and yet knows the way he means to take. He mounted up the hill, thinking of what he had seen and heard, and scarcely knew where he was till he stumbled upon the sentinel, who demanded fiercely, "Who goes there?" He was too young a soldier not to be surprised; so his tongue hung fire, for he had forgotten the countersign, when another voice roared out, "Fire, you careless idiot, at once." This roused the intruder's intellect, who stammered, more dead than alive, "The Sword of Gideon and of Schuneman."

"Ha! ho! that's enough, my dainty callant;" for it was Grant, the Scotchman, that spoke. "You have na learned your carritch o'er weel. But we'll forgive you this time. It would na been gude for you had a ball been put through your wame this cauld night, just because Schuneman's name was na found in the Book o' Judges. But where the deil hae you been a' this time? You've had a lang claver with that warlock in the house. It brings me in min' of Saul consulting with the witch of Endor, before the battle on the mountains of Gilboa. I hope maer luck may come of it. It's no canny, laddie, and I'm sorry that the minister should show you sic an example. But gang awa, and lie down on your bed; you are quite dazed, I see. There is my plaid, take it and row it round you. It is a wee wet, you feel; but that's the way we do in the Highlands—dip it in a spring, wring it out, and it will keep the cauld keen wind frae penetrating your banes. Mair especially as I fin' from your breath that you have got a gude dram. A kind witch or ghaist he maun be; I wish he would come up this way. Now there you may lie like King Charlie himself, when he was chased like a partrick on the mountains."

Teunis was too tired to resist the attention of the kind Gael, and he slept almost before his head fell on his moss pillow, so that before his nurse left him he was heard snoring soundly. Turning away, Grant said to himself, "Ou aye, puir chiel", his head doon, his house is theekit."

Silence reigned over all the hills. Every voice was stilled. Man and beast were alike gone to rest. Already, the early frost had silenced the insect tribes, and the two carcasses slain that morning had attracted the prowling races to the southward of the two camps. A distant growl or yell might be heard as if quarrelling for a dainty bit, or a summons from a new arrival to prepare for a

surrender. Man had lain down to recruit his weary body, and regain more energy of passion, now exhausted by the toil, the suspense, the anxiety, or the frolic of the previous day.

One only acted the part of sentinel-general, and seemed to move like a ghost in unrest, as he went from cliff to cliff; through hollows and brakes, as if these were as familiar to him as his native home. It was the strange and gloomy recluse who had in his time paced the banks of the Thames and the banks of the Seine. He had fought under Clive in Bengal, and had traversed the jungle where the Hoogley rolled on its yellow sands. And now he had become familiar with scenes of a more rugged and impressive character, in harmony with his desperate nature, made more intense from the passion of revenge, which he had nursed in secret discipline, for two whole years. He found relief in these lonely wilds during the midnight hours, till every tree and spring had become an acquaintance, whose company he had courted with ardent affection. One great overwhelming passion glowed within his spirit; and but for the prospect of gaining gratification, his brain must have burned out all his reason, and his heart become crisped like the foliage of the trees, when the heavens are brass and the hills iron.

On this night it was impossible for him to sleep, and could any eye but a spirit's have followed him, he might be seen walking in his close fur helmet, a leathern doublet tight to his body, with breeches and boots of the same material, while in a broad belt round his waist were hiding those weapons which he had ever had with him, though the only visible arm of defence was the long hickory pole, shod with sharp steel at the point, but containing in the head a strong dagger, which started from its place by the touch of a spring at the middle, rendering what seemed but a peaceful hermit's staff, on a sudden a lance fit for the hand of a knight-errant. From his cell to the north of the Dominie's camp, he traversed slowly, till he came in the rear of Brandt's forces, taking a narrow and perfect view of the whole from the South Mountain. Passing down the streams and trails where only the wild beast runs, he came to the main falls, and gave a passing glance at the pool, where were hidden the objects of that search on which were so many minds at that instant intent and dreaming. Before daylight he returned, saying in brief soliloquy, "how easy it would be for me to deliver

those captives by the road I have taken myself, and the words of that honest man still echo in my ear, 'It is dangerous to help Providence.' He would say nothing should take the place of positive duty. Relieve now, and trust the rest. But the punishment must be measured out in the presence of all. The report must be carried back where it will tell. Sir Henry Clinton must be made to see that he has but narrowly escaped the vengeance he has proudly invoked. Yes," said the excited exile, striking his staff on the rock, "it shall be heard of in the army, that the villain has been made to bite the dust. And in London, too, shall it be said that the heir of Brantwood had power left to punish his enemies though they hide themselves in the lair of the panther."

Returning to his cabin, he threw himself on the skins which lay on the settle, that served for seat and for bed. His voice died away in prayer that God might give his hand strength for justice, and bitterly weeping, he cried, "Thou pure Spirit, whose bosom was soiled by the slimy serpent, thou who heard my vow of vengeance, come and behold justice meted out for thy dishonor!"

#### CHAPTER XXXV. THE LAST INDIAN BATTLE ON THE RIVER HUDSON, 1760.<sup>1</sup>

THE fretfulness of Brandt with his braves was becoming every hour more apparent. The hope of succeeding in diverting the colonists from watching the passage between the north and south was almost fled. But the pride of the Mohawk was mortified when he thought of retreating back into the wilds, where he knew that he must be buried in obscurity. Could he only get a foothold on the Great River, making the mountain his base, he might be of some importance in the eye of the great King of England.

Upon this weakness of the Indian, Clifford was directing all his skill, holding out the hope before him of being able, after a few days, to descend and make a lodgment on those very islands which they could distinguish from their camp at the mouth of the Kaatskill Creek. Not that he deemed such an attempt wise, or likely to be successful, but anything which might detain the Mohawk here for a few days longer was deemed by him to be lawful.

<sup>1</sup> Colonel Stone refers to this battle, and quotes from a manuscript history by one Smith of Schoharie.

The little army of red and painted men were preparing for the grand hunt that was to come off that day; and while the braves were so engaged the leaders stood out upon the verge of the cliff, watching the mist as it rolled away at the sight of the sun.

"I have heard," said Clifford, as if incidentally, "of a great battle being fought for the kingship of the Six Nations, on those two islands below these, between your ancestor Hendrick and Etau-o-quam, the Mohican; does the great Mohawk hear me?"

"Thayendanegea was there," replied the chief, proudly, "with King Hendrick, when no bigger than an eagle's height. There this wound was made; the first time blood came at the point of a spear."

At this the chief made his shoulder bare, that the wound might appear. Clifford was gaining his end without an effort, and as if casually, said:

"Some of you old Dutchmen must remember that battle; it is not over twenty years since."

Several spoke here at once, saying that they were present as spectators; but all allowed the Elder Abiel had the most to do with it, being acquainted well with the Mohican chiefs.

"Well," said Clifford, "we have an hour to spare, let us hear the account; I am sure it must please the Mohawk chief, the present king of the Six Nations, to listen to a white man telling of the bravery of Hendrick, who fought for the crown which Brandt now wears so nobly. It would be pity to leave those beautiful islands down there in the hands of the rebels, when another battle would secure them to the rightful owner."

The Elder Abiel, thus pressed into the service, could not escape from the task of narrating what he had seen. The subject was familiar to him; and as his audience were evidently all interested, he began as follows:

#### THE ELDER ABIEL'S STORY.

"The ground of that war between the Mohawks and the Mohicans, was the crown of the Six Nations. Hendrick had been in England and felt that the title went a great way there. So had Etau-o-quam, but he was of a more exalted mind in religion and was less ambitious of distinction. He was stirred up, however, by his son Newabina and by the people of New England, who wished to cripple the power of Sir William Johnson in the West. Hindering Hendrick they hindered

Johnson; so they secretly set the one chief against the other. There had been much manœuvring all over, of which we heard a little.

"The chief village of the Mohicans was down there. There are remains of it still to be seen, but it was once a thriving place, the centre of a large population. Etau-o-quam had his wigwam on the Haup-pee-naus, a high bluff at the angle of the creek. He was an old man, very lofty and proud of having seen Queen Anne, who gave him and some other chiefs royal robes. Dominie Schuneman says the whole account is in a book called the Spectator. Colonel Clifford no doubt has read it?"

"Yes," said the soldier, growing sincerely interested, "I remember seeing the Indian Kings at Drury Lane Theatre, just as Addison describes them. Go on."

"The first notice which we had of the coming war was through one Drake, who was on a trading excursion, as he pretended, but who really came hither from Stockbridge with a message from these wise men of the East to the great chief Etau-o-quam.

"That chief had gone out leaning upon the arm of his son, Newabina; himself a noble specimen of the red man. Dressed in the regalia he had received in London: he felt a presentiment of his end being near and he longed to look once more upon the lofty mountains. Rising to his full height, he held out his hands, as if to embrace the towering height. Knowing every change which High Peak puts on, he perceived that a new aspect was assumed, indicative to him of a change for himself.

"The sun sets amidst the mist," said he. "There is blood mingling with the streams; I hear the music of war, I must fall with my mantle around me. Let me be gathered into Asinath, the tomb of my fathers. But first must I drink of the spring that runs close by their graves. Thereof I drank in youth; to that I ran first, on returning from the house of the great queen. I shall come from the hunting-grounds of the west to drink of that clear fountain."

"It was on returning from this sacred pilgrimage, that the man Drake met him; putting into his hand a small package, which was not opened then, and though the curious trader felt anxious to draw the chief into conversation, he got no reply, which somewhat annoyed the inquisitor. Falling

in, however, with an old acquaintance, who had come hither from Ulster, the travelling merchant found good quarters with Johannes Du Bois, where he was sitting quietly after supper, telling what he knew, that he might get knowledge back with interest; or as he said himself, he put a little water into the pump so that he might pump all he wanted out of the cistern.

"I guess, Mr. Du Bois," said the trader, "you can read Ingen?"

"The Dutchman, who was a man of silence and was at that time enjoying his pipe, merely nodded his head.

"Well," continued Drake, "tell me the meaning of a muskrat darting at an otter?"

"Du Bois here took his pipe from his mouth and sprang to his feet with a leap that startled the peddler up to the same position, where they stood facing each other, before either found a tongue. Du Bois spoke first.

"Where have you seen that sight?"

"I did not say I saw it, I only asked what it meant." For his conscience told him he had been guilty of violating the trust put in his honor.

"You will know what that means before long, if I be a true prophet. The great Mohawk has sent his challenge, or else our chief here has got word of the coming he has been expecting for a month past. The muskrat is the Mohawk's totem, and the other is for the river chief. You can read the rest."

"Or, as a Philadelphia lawyer would say, their sign-manual. But do you suppose that old chief will fight?"

"Do you think he will die," said Du Bois; "He will fight as sure as death; and there, I declare they are singing the war-song now. Nay, see how the fires are burning all over the country."

"Yaw! yaw!" said Gertrude, the wife of Du Bois, "there, the lights are blazing on the Haup-pee-naus." She said this as she lifted her babe in her arms, running in terror to the door, that she might hear as well as see; she called as she looked back:

"They are singing psalms to their God. Their squaws are loudest."

"Rather to the devil," said Drake, whose Puritanic blood rose at the thought of these red-skins and their cruelty.

"The house of Du Bois was on the banks of the stream that comes down from these little lakes,

and was situated about half a mile from its mouth. It was a strongly built stone structure, after the Huguenot fashion, one large room with chambers overhead. It could be turned into a fort in time of need; but before Du Bois would determine on his course, he deemed it best to take a quiet survey of the camp. Accordingly he walked out along with Drake, who was no coward, though a peddler. They climbed up a hill, that stood between the house and the Hau-pee-naus, where they saw the beacon burning all along the base of the mountain. Du Bois understood the warning, and made up his mind it would be best to move his family inland, and turned back with that intent.

"'Gitty,' said he, 'is a brave creature, but there is no saying what these bloody beings might do when their wrath is up.'

"'I guess,' said Drake, 'I now understand the meaning of those dark hints that Priest Wheelock threw out about wars and rumors of war, last Sunday.'

"'There was but little sleep for any of us,'" continued the Elder Abiel, "in that region all that night. We on the Vlatts soon heard the yells of the roused warriors, and though the Mohicans were our friends, an Indian in a rage is a very unpleasant companion. I started in the middle of the night, and took my stand on that kekute from which you see the smoke rising now, where I met a number of my acquaintances, and we looked down on the red circle, where the old chief stood in the midst, dressed as I have told you. He was dancing as a young chieftain mingles in the crowd. All night there was a ceaseless stream of their squaws and papooses passing on to Castilberg, where it was supposed the weaker portion of the population would be safe. Still these were not unarmed, nor unprepared, for Etau-o-quam himself was there in command. While on the outside of their village, to the south, a strong party were secreted under the command of the chief Newabina, and a third division was on the little island at the mouth of the creek. It was in a measure to be a pitched battle, and scouts were sent out by both armies as early as twilight, with orders to penetrate as far as possible, and divine their modes of attack and of defence. Those of the Mohican did not require to go far till they met the Mohawk fleet, on its way down, making for the larger island out in the river, where they all disembarked. However, this was for the purpose of deceiving the

enemy on the main land. Hendrick had received accounts from his spies of how the foe was posted, and determined to surprise him in all his three points. In this he showed a lack of that wisdom he had learned when afterward at Saratoga. When Sir William Johnson was bent upon dividing his forces, Hendrick, his Indian ally, took three sticks, giving one after another to the Englishman, bidding him break them; and taking three more, he handed them to him at once, and asked of him to do the same thing. The symbol was understood and the advice taken with success. Hendrick had learned something of the art of war in this little battle, where he nearly lost all by dividing his forces.

"A heavy fog lay upon the river all night, which prevented the attack from taking place as early as was the Mohawk's intention; still he sent out one party from the upper end of Ussaman Island, who were to follow a small stream on the west side of the river that comes down through the rising ground which you see to the north of the Kaatskill Creek, about two miles distant up the river. Scouts had already, through the dark, crawled forward one before the other, at certain distances, so as to be heard by one another through signs preconcerted; so that the whole devoted camp was encircled, and the ground fully understood before morning dawned. Every ear in the beleaguered fort was awake, and scarcely a whisper was heard, for all waited for the onset. It did come upon all three forts at once. Hendrick sailing down the east side of the river early in the fog, led his main body from a few miles below, up through the woods, where they lay coiled like so many serpents on the ground, till they heard the war-cry from Castilberg, when up the great chief Hendrick started, giving the whoop to his braves, then rushed upon the camp of Newabina, which was there to meet the onset with a vigor and a spirit which made the Mohawk fall back crestfallen for a time. But for the renown and power of their leader, all would have been lost. As it was, they had to take to the trees and the gullies, where they crouched, and watched the movements of their enemy, whose spirit being flushed with the success of their defence, were more than ready to expose themselves to the eyes of the marksmen on the other side, and consequently lost several of their best warriors through extra zeal and courage.

"The attack on Castilberg was simultaneous

with that on the Hau-pee-naus village by Hendrick, whose intention was to surround the island, where he supposed the main body of the Mohicans were lodged, and thus cut off their retreat, so that they would be entirely massacred; for little Abraham, Hendrick's brother, was hovering around the island Wantona with a fleet of canoes, ready at a signal from the land to enter upon his part of the battle. We have seen how the attack upon Newabina's force was repulsed, and that upon the castle did not come off any better. The old chief, Etaw-o-quam, took the command, and felt the blood of his youth rise to fury. Like the old war-horse that the good book tells us about, his neck was clothed with thunder. He smelled the battle afar off; and said Ha-ha. Rushing from the gateway of the fortress, he shouted his war-cry, so clear and strong, that his people below who heard it regarded it as the sure omen of victory. His scarlet robe still on him, but bound round his loins with a bear-skin belt, and his crown tied under his chin, he swung his famous tomahawk, till he fixed his aim, then flung it with a force and a skill into the skull of the leader of the assailants, which felled him at once to the ground. Rushing forward on the prostrate foe, he had his hair at once in his hand, and his scalp-knife at its dread work, so that he succeeded in tearing the trophy from the head of his enemy, but was struck down himself by a blow that laid him on the ground, from which he was borne off by his people, and placed within the fort, upon his bed of skins. His example had its effect upon all, friend and foe. The Mohawks were beaten back as far as the mill which stands there to the east of Castilberg, where they took refuge. The force in the castle was not strong enough to storm them, nor was it intended that this party should act except on the defensive. They returned to watch over the old king of the rivers, who had evidently struck his last blow. Body and soul were alike yielding up, and preparing himself for his departure to the hunting-grounds of his fathers, he sent a message to Newabina, commanding his presence when Hendrick was repulsed.

"That brave chief was restraining his own followers, and at the same time watching the movements of the Mohawk. He had most to fear from the pent-up ardor of his braves, who were eager to rush out and become the assailants; but he satisfied them by encouraging individual prow-

ess, while the main body were spectators of the fierce play. If a Mohawk was seen to skip from tree to tree, coming all the time nearer, Newabina would encourage some volunteer to rush over the defence around his camp, and scalp the skulking enemy. An instance of this kind kept the two parties at bay for a time. One of Hendrick's braves was observed by the Mohican chief himself to ride behind a large oak, and from that take aim so truly that his shots told upon several of the best men of the army. The patience of Newabina was exhausted, and without any previous sign he rushed with such unexpected fury upon the hiding Mohawk, that he nearly stumbled over the foe; when with one blow of his battle-axe he prostrated him to the ground. With his fingers twisted in the hair of his enemy, he was preparing to finish his work, when the keen eye of Hendrick saw the advantage, who was soon on his way to take the combat on himself; but being heavy and stiffer than he had been, he measured his distance so that his tomahawk fell short of its mark, and quivered in the oak behind where the Mohican stood with the dripping scalp in his left hand and his knife in the other, ready to plunge it into his great enemy, when he came up. Prudence restrained both of these wily chiefs from single combat. The crisis had not yet come.

"Like all Indian battles where they were so evenly matched, this combat continued for several hours, and but few lives were lost. Defeated in their cunning at surprisal, the Mohawks fell back. So far as the battle had gone, the Mohicans were the victors. Aware of the approach of the Mohawks, they had been ranged in fine order in the form of a half moon, behind an intricate brush fence, which had been in use before this in a former contest, and had then proved its worth. They had improved it, and made it impenetrable to half-naked men. Every attempt at breaking through only hurt the assailants, and just at the time when Hendrick's braves were becoming discouraged, he received word of the failure on Castilberg, which made him decide at once on a retreat; as, in proportion to his loss, would be the gain of his enemy. Trembling every moment lest he should be attacked in his flank by the forces of the hill, he retired by degrees, fighting all the way. His retreat was masterly of its kind, and new to his pursuers, so that they were puzzled; losing ground rather than gaining new laurels, Hendrick

put his men that bore fire-arms into three files, running parallel to each other, when they moved backward, but as the two outside ranks discharged their pieces they ran, leaving the middle rank to defend, as long as possible, when they also fired, running immediately and passing their fellows, who by this time had loaded, and were ready for defending, firing and running, so that by the time they had reached the place where their canoes lay off in the river, the Mohicans had not come up, nor did they see what was going on of the embarkation till the last file were leaping into the water up to their middle, and swimming out to their companions, leaving their pursuers shouting defiance, and yet feeling that it was but a partial victory.

"Little Abraham's attempt upon the island Wantona was not more successful than the other two attacks. Indeed, from the first it was more a feint than intended to be serious; though from

the natural fury of the Indian character, it became soon too bloody to stop at the command of a leader less than Hendrick himself. Having strict orders not to leave their canoes at the risk of losing them—since upon them lay the safety of the whole expedition, in case of a defeat on the main land—this third division did not venture far into the sycamore woods, which served so well as a means of defence to the party lodged within; still, some of the more venturesome rushed over that boundary, and were cut off from the main body, falling into the hands of the Mohicans, who were hidden among the bushes, lying flat upon their faces till they saw their chance. Abraham drew his braves off without attempting a rescue, which he saw was vain, and had the mortification of seeing a few of his best men killed before his eyes with horrible cruelty. Retiring immediately to the Ussaman island, he sent down the canoes to aid his brother in his retreat.

## WOODED AND MARRIED.

### CHAPTER XXXIV. CRUEL AS THE GRAVE.

BEFORE they parted for the night, Dym timidly sought permission from Mr. Chichester to share her secret with his mother, but she was a little surprised at the hesitation with which he acceded to her request. Her look of astonishment recalled him.

"You have promised to trust me," he said, with a grave smile at her perplexed face. "In fact, you have given me a very full and convincing proof of your faith in me a very few hours ago. Am I asking too much if I beg you to trust me a little longer?"

"Do you wish me not to tell your mother, then? I only thought"—Dym's perfect faith was jarring sadly with her old sturdy honesty. How was she to keep from Mrs. Chichester that she was engaged to her son?

Dym's face was always eloquent, and Mr. Chichester understood her thoroughly.

"You would be a very transparent deceiver, I am afraid. No, my child; I never meant to lay

such a yoke on your conscience. Tell my mother, by all means. I only ask that for a little while she may be the only confidante. Do you understand me?" taking her hand with one of his persuasive looks.

"Of course I shall do as you wish," she replied, coloring high under it. "There is no one else whom I care to tell, unless, perhaps, it were Humphrey," with a quick throb of pain as she thought how Will would have rejoiced in her happiness; and, as though he again understood her, he drew her closer to him.

"I am almost glad that you have nothing to give up for me," he said, tenderly, after a minute's silence. "You have always seemed to belong to us somehow. My cousin is going away to-morrow to stay with some friends in Cumberland. On her return I shall tell her myself; but until things are definitely settled I have no wish that our affairs should furnish food for village gossip. Only," with a droll look, "I think with you that Humphrey has a right to know. I am afraid he wanted

somebody very badly himself once upon a time. Would you rather he should hear it from me, Dym?" And Dym shyly answered, "Yes."

It was well that Dym was too young and inexperienced, as well as too humble-minded, to expect much attention from her *fiancé*, for certainly Mr. Chichester was not a demonstrative lover. Dym's unselfishness and devotion saved her from many a chill feeling of disappointment.

After a little time he resumed his ordinary manner with her, and, except that he sought her society more frequently, and on all occasions paid the utmost deference to her opinion and wishes, there was nothing that could betray to the most watchful eyes that he had exchanged the friend for the lover.

A thorough understanding prevailed between them, but it could hardly be called courtship; he had always been kind and gentle with her, and now he was doubly so. With instinctive delicacy he contrived to infuse a new element of respect into his manner; he was less abrupt and more yielding. Dym was often distressed at the way in which he would set aside his own wishes or plans if he thought he could minister to her pleasure. A shadow of disrespect to Miss Elliott was sure to bring down his severest displeasure on the offender, tacitly rather than by word. He was proving to her that she was the woman whom the master of Ingleside delighted to honor; and yet there was nothing lacking in his devotion.

Dym thought her lover perfect; to her there was simply no flaw in her happiness. He was a little grave and absent in his manner, perhaps, when they were alone together, and yet Dym always felt that her presence soothed and pleased him. It never entered into the simple girl's heart to wonder why he spoke so little of their approaching marriage, but rather shunned the subject, as though it involved some present difficulty and pain. He would talk to her about herself, about Florence's future, and dwell long and gratefully on their mutual affection for the child; or else he would relapse into silence, and only by the rare caressing touch of his hand on her hair would he show that he was conscious that she was still by him; and yet after a brief absence he would welcome her back so gladly that Dym knew that in some way she had become necessary to him.

But he never told her that he loved her, neither did he express a wish that she should call him by

any other than the old name. "Guy,"—she said it sometimes softly to herself, to see how it sounded, but somehow it never came naturally. "Perhaps when we are married he will teach me to say it," she thought. "I suppose he will not then be Mr. Chichester to me."

Dym bungled sadly when she began her story of her engagement to her friend. It was a pity no one was there to see the girl's sparkling blushing face. Before she had half finished she was clasped fondly in Mrs. Chichester's arms.

"I never dared to hope this," she sobbed. "Oh, my dear, you have made me so happy! Guy will never go away again now. I don't know how it is, Dym, but you have always been like my own daughter to me; but I shall love you all the better now." But Mrs. Chichester wisely kept her raptures for Dym: her womanly instinct led her to say very little to her son.

"I am glad of this, Guy," she said, detaining him by the hand when he came up to wish her good-night—"very glad indeed; you could not have done better for yourself and Florence."

"I am sure of it for Florence," he returned, briefly.

"Not for yourself, Guy?" in an anxious tone.

"For myself of course," with a light laugh.

"Do you think I am capable of such a piece of self-sacrifice as that?"

Mrs. Chichester sighed.

"I know what this must be to you. Things are so different, and you have changed with them; but you will not refuse to let me wish you happiness, my son?"

"No, indeed," he replied, speaking as though he were touched, and bending down to kiss her.

"It will not be unalloyed happiness just now, but it will come in time, Guy. It must, it will; she is so young, and loves you so dearly, you will make her what you will."

"She is a noble-hearted little creature, and I shall do my utmost to make her happy," was his reply, in a tone of deep feeling; but as he dropped her hand Mrs. Chichester felt herself a little damped by his lack of enthusiasm.

"He has not forgotten Honor, in spite of his new fancy," she thought; "Guy is so faithful." And she called Dym to her side and tenderly caressed the girl, as though she would make amends for some fancied slight.

Mr. Chichester kept his promise of telling Hum-

phrey Nethecote. Humphrey came up to Ingleside one evening to wish her joy.

"The squire has told me, my dear," he said, taking her two little hands, and looking at her fondly. "Somehow I have suspected this all along, Dym."

"Oh, Humphrey, how could you?"

"It was not possible for him to see much of you and not love you," he returned, in a voice that that was a little husky: "it wouldn't be in man's nature, especially now he is so lonely and sad. Don't you feel that Honor will be glad to know you are taking care of him and the child?"

"Dear Humphrey, how good of you to say that!" she whispered, with the tears in her eyes.

"Well, if he makes you happy, that is all I ask of him: you must not expect too much of him at first; the squire is not the man he was, but he will pick up after a time. I should have guessed by your face something pleasant had happened. Folks will say you are young to be the squire's sweetheart, when they see you beside him."

"He is not so old," she replied, pouting; "Mr. Chichester is not quite forty yet: he told me so."

"Nay, but the trouble has changed him. Well, heaven bless you, my dear; when you are a happy wife you won't forget your old friend Humphrey?" somewhat wistfully.

"Never, Humphrey! What are you thinking about? Are you not our dearest friend—his as well as mine?"

"Nay, nay, not the dearest; but as true a one as you need have." And, moved by the sadness of his expression, Dym, for the second time in her life, lifted up her face and kissed him.

The weeks passed on. April, with its chilly freshness and vaporous sunshine, was over, and the May hawthorn was filling the valley with sweetness.

Dym was getting used to her position now; and the clear young voice could be heard again caroling among the shrubberies in the early morning; her light step had recovered its springy tread; the glow of a new hope shone in the clear dark eyes and lit them with strange brilliancy. Guy would sigh softly to himself as he watched her about the house.

"She is so happy that it would be cruel to shadow her brightness," he thought. "All I marvel is, that she can be so easily satisfied; she must feed on her own loving fancies. Sometimes I am afraid

she will wake up and find I give her very little in return for her devotion; it is not always so with other men; the second love deadens the first to a great measure; they remember, but they are consoled. Will it ever be in her power to console me for Honor?"

And once this thought of his found utterance in words.

"What makes you look so happy, Dym?" he said, when he found her singing to herself as she arranged the flower-vases. Dym blushed very prettily—she always did when he spoke to her—and then she mutely offered him a rose.

"Thank you, but I want the answer too," he said, detaining both the flower and the hand, and looking at her with a sad sort of envy. Dym glanced at him shyly before she bethought herself of her reply.

"How can I help it," she said, at last, "when you are so good to me!"

Guy smiled at that.

"Am I good to you, my child? I am afraid you are not an impartial judge, Dym. What other girl of your age would be content with a sober middle-aged lover? Are you not afraid sometimes people will take you for my daughter?" pulling at his long gray beard with a comical gesture—people said his prematurely gray hair had aged Guy Chichester wonderfully. Dym treated him to one of her bewitching smiles in reply—they dazzled even him sometimes. In spite of what people might say, was he not always grand, lordly, altogether perfect in her eyes?" I believe Dym never could be persuaded that his beauty was not faultless; to her, her lover was a sort of Apollo and Jupiter Ammon in one.

"You are always good to me, except when you make these sort of speeches," she said, half pouting: "you are as bad as Humphrey, who is always making himself a Methuselah. I would not have either of you a bit different. Don't you believe it?" looking up at him wistfully.

"I believe you are under some sort of glamour," he said, half seriously, half laughing. "There, put your hat on, my child; I want you and Florence to ride over to Ripley with me;" for Mr. Chichester had taught Dym to ride, and Humphrey Nethecote had trained a pretty bay mare, and had sent it up to the Ingleside stables for Miss Elliott's special use.

The morning air was delicious, and Mr. Chiches-

ter in an unusually cheerful mood: nevertheless Dym did not entirely enjoy her ride.

"I am afraid you will be sorry to hear Beatrix is coming back to-morrow," Mr. Chichester had observed, as he lifted her into the saddle. Dym stooped over her horse's neck and stroked its mane as she answered him. She was rather silent for the next mile or two, only Guy did not notice it; somehow those few words had damped her enjoyment. Mr. Chichester detained her for a few moments that night when his mother had left the room.

"Dym, I have never given you an engaged ring. I wonder you have not noticed the omission," he began, when they were left alone.

"I thought you disliked the fuss," she returned, timidly; "it was not necessary. Besides, people might be attracted, and we could trust each other without the sign-manual of our agreement."

"Ay," his keen brown face lighting up with one of his droll smiles, "you are a good little thing, and yet I always understood young ladies regarded such things as sacred talismans."

"Of course I should like one," returned Dym, with her usual sweet honesty; "and your mother says"—

"Oh, my mother's taper fingers have been meddling, have they? Well, I have not forgotten you. Look here!" And he slipped a tiny hoop studded with pearls upon her finger. "Diamonds tell tales, and so do emeralds. This is like yourself—simple, and pure, and good—and will keep its own counsel." Dym thanked him silently, but he did not let her go just yet.

"One word more, my child. You have reposed such generous trust in me that I feel I should be undeserving of it if I did not show you more confidence in return. You know this time of year is full of painful memories to me; I shall breathe more freely when a month or two have passed. When the autumn sets in, I propose leaving Ingleside for a few weeks; my mother can then make our engagement public, and as soon as your arrangements are completed you can join me in London, where I propose our marriage being solemnized. You will not mind a quiet wedding away from Ingleside, will you, Dym?" And Dym, trembling and flushing, faltered out a happy "No."

It was the first time that he had ever alluded to their marriage. Alas! she little knew the difficulty

with which he had braced himself to the subject. Delays were useless in their position; it would be better for them both when she was once his wife; he would be very fond of her, and take good care of her, and she would be the sunshine of the house, he thought—only Guy Chichester finished with a sigh.

Dym woke from happy dreams the next morning with a strange oppression at her heart: something had happened, or was going to happen. As her eyes fell upon the hoop of pearls, she suddenly remembered Mrs. Delaire had fixed this evening for her return.

Dym scolded herself for being superstitious. Why did she always augur evil from Beatrix's visits? Her presence had often brought trouble to Dym, but surely now the spell must be broken.

Mr. Chichester had promised that he would announce their engagement to his cousin himself; it would be badly received, she knew. Dym had an instinctive feeling that Beatrix had always watched her with jealous eyes; she would regard her as a designing interloper, probably she would accuse her of intriguing. Would she meet her with cool sarcasm, or pour down the vials of her wrath on Dym's devoted head? Beatrix's envious passions were soon aroused, and on such occasions, as Dym well knew, her words could be dangerous.

Dym's lark-like voice was silent that morning; she was a little anxious and *distract* at luncheon; Mr. Chichester noticed it.

"I am sorry we cannot have another ride together before Beatrix comes," he said, as he joined Dym at the sunny terrace window. "But this stupid business of Latimer's obliges us to go over to York. I am afraid I shall not be back to dinner, mother, so you and Dym must do the best you can without me."

"Must you go?" sighed Dym. She followed him disconsolately out into the hall. When his horse was brought round to the door, as she looked up at him, he saw her eyes had tears in them.

"Why, my child, what ails you?" he asked, in some surprise; for it was new to him to see a shadow on that bright face.

Dym drooped her head. "She did not know."

"I believe Beatrix has become a sort of moral wet blanket to us both," he said, cheerfully. "Never mind, you shall not be troubled with her long. Why, my dear Dym!" as she suddenly

clasped her hands round his arm and laid her face down upon them. Dym's timid reserve had never given way so completely, and Guy's tone was a little anxious.

"You have never been so sorry to part with me before," he said, trying to rally her. "I shall suppose all sorts of things. You must not make me too vain, Dym."

"It is not that," she returned, unsteadily. "I don't know why I want you so; but, oh, if only you need not go this afternoon?"

"You will make me wish it too, dear, if you look so sad about it. But, come, I cannot leave my little sunbeam eclipsing herself under such gloomy fancies; you must not send me off with that sort of face, Dym," as he lightly touched her forehead.

Dym gave him a misty smile at that. She slid a cold, nervous little hand in his as she wished him good-by. As he rode slowly down between the limes, he looked back and waved to her—a little shimmering gray figure, motionless in the sunlight.

Dym was alone in the drawing-room when Mrs. Delaire arrived. Their greeting was a somewhat silent one. The young widow looked fatigued and depressed, and threw herself on the lounge with a wearied air. Her face had its jaded, dissatisfied expression. She was scarcely as beautiful as usual, Dym thought, and her tones had their old sharp ring.

"Miles tells me my cousin has ridden out this afternoon," she said, when Dym had relieved her of her mantle and had brought her a cup of tea.

"Yes; he has been obliged to go to York with Mr. Fortescue. He has business in Harrogate, too; they will hardly be back till ten or eleven, Mr. Chichester fears."

"Mr. Fortescue generally chooses inconvenient times for business," retorted Mrs. Delaire; and there was another embarrassed silence.

Dym tried to talk on different subjects, but evidently Beatrix was not in a sociable mood. She listened with a preoccupied air, answered in monosyllables, and finally rose with a yawn.

"I am dreadfully tired; I think I had better go to Aunt Constance now. By the by, Miss Elliott, Guy said nothing in his letters about your intention of leaving Ingleside."

"I—I have changed my mind."

"You are not going?" with a sudden hard in-

flexion in her voice that set Dym's nerves quivering again.

"Mr. Chichester asked me to stay," she returned, faintly, hanging down her head. What had become of Mrs. Chichester all this time? if only Florence would come into the room! Dym was starting away from the topic again in a sort of frightened way, but Mrs. Delaire sternly recalled her.

"My cousin asked you to stay?" she repeated, and her voice had a certain shrill tone in it. Surely she could not have heard aright. Ask Miss Elliott to stay, after what she had hinted—impossible. Guy could never have been guilty of such imprudence.

"If my cousin chose to be so rash, you need not have taken advantage of his generosity," she continued, coldly. "After what you have owed to me, it would be the grossest impropriety for you to remain under his roof."

"Stop, Mrs. Delaire! you must not speak to me in this way," interrupted Dym, beginning to tremble. Ought she to bear Beatrix's insolence now she belonged to him? She turned the hoop of pearls nervously round her finger as she spoke. The action did not escape Mrs. Delaire's sharp eyes.

"Why may I not speak to you? If you do not know what is fitting in your position, it is my duty to interfere and save you. Aunt Constance must know about this; I must tell her—warn her."

Beatrix was working herself up into a sort of passion now.

Dym humbled herself to make a final appeal.

"Mrs. Chichester knows. Why should you trouble yourself to interfere, Mrs. Delaire? I am doing you no wrong."

"How do I know that?" replied Beatrix. Her eyes flashed; her bosom heaved stormily. "How do I know that you have not thrown yourself on his compassion; that you have not induced him to— Who gave you that?" suddenly stretching out her hand in the attitude of a tragedy queen, and pointing to the poor little hoop of pearls.

"Pearls keep their own counsel," he had said to her; but there was no evading those jealous eyes.

Dym changed color, and then womanly dignity came to her aid: evasion was impossible.

"Mr. Chichester gave me these," she said, looking up with calm eyes into Beatrix's excited

face. "Now you know why you must not say these things to me; because—because I am going to be his wife."

Dym made her little confession very sweetly, but she was alarmed by its effect on Mrs. Delaire. The widow started as though she had received a shock; her pale face grew paler—she gasped for breath.

"To be his wife—Guy's wife! Impossible! I will not believe it," she muttered, sinking on a seat. Then her mood changed.

"So this wise cousin of mine has proposed to you?" she went on, in a mocking, sarcastic voice that made Dym's cheek burn.

She bowed her head in assent.

"It is like him—Quixotic and mad as usual. And you, poor fool! you—you accepted him," in a tone of infinite contempt.

"I accepted him, certainly, and we are engaged," returned Dym, steadily.

Her quiet dignity seemed to provoke Beatrix beyond endurance.

"And this is your love and gratitude to your benefactor! Poor love—pitiable gratitude, I call it, Miss Elliott, to allow him to lower himself to such a sacrifice as that. But he shall not, if I can save him from it," stamping her slender foot, as though the mere thought were insupportable to her. "You have acted so meanly that I shall not try to spare you. Ay, you may love him, Miss Elliott, but you will never be his wife. Girl as you are, you will shrink from the thought when I tell you Guy Chichester is only marrying you out of pity."

Dym's face grew almost convulsed. "How dare you—how dare you say that, Mrs. Delaire?"

"I dare to tell you the truth," replied Beatrix, scornfully. "Do you think he could ever choose such as you after Honor? What! you have lived under his roof all these years, and you have not discovered that Guy's weak generosity is his only fault? He is doing this for his mother's and his child's sake, and because he knows you love him."

"Oh, heavens! she has told him!" cried the miserable girl, clasping her hands before her face.

"Yes, I told him," returned Beatrix, in the same freezing tone. "I would have kept it from him if I could, for I was afraid of this, but he made me angry, and then it all came out. I told him you were leaving Ingleside because you were dying of love for him. Do you wish to hear how he

answered me?" But Dym only wrung her hands and groaned heavily. In her darkest hour had she ever felt despair like this? Oh, God! that she should suffer such bitter shame, and at the hands of this woman!

"He looked at me," went on Beatrix, in the same hard voice, "as though I had dealt him a blow. 'Could you not have saved us both from this, Trichy?—could anything more unfortunate have befallen us all? Poor child! in whichever way I act I must wrong her. I could never love her as I love Honor—never, never!' You should have seen his face as he said it: it was pitiful—painful!"

"In mercy, and as you are a woman, hush!" Beatrix hardly recognized the voice. Her passion was dying out, and a sort of horror at her own work came over her as she looked at Miss Elliott. The girl was lying back in her chair, with her eyes closed and her poor lips quite drawn and blue; it was as though she had heard her own death-warrant.

"Are you faint? Shall I get you something?" Beatrix was a mere girl still; an uncomfortable feeling of remorse began to take possession of her. Dym just stirred, and shook her head. Mrs. Delaire watched her irresolutely.

Dym's dry lips were moving now; she signed to Beatrix to come closer.

"On your honor, is this true? As there is a heaven above us, have you not lied to me in this?" holding up her young hand solemnly with an appeal that was almost awful to Beatrix.

But it was too late to undo the mischief now.

"I have told you the truth," she returned, sullenly; "you must blame yourself, not me, for this miserable business."

"I shall try to forgive you some day, I suppose," faltered the poor child, "but not now—not now: the words would choke me," putting her hand to her head and looking at Beatrix in a bewildered sort of way. "Tell them I am not well—no one must come near me; I have work to do. I must think—think—think," with a ghastly smile that somehow curdled Beatrix's blood. As she walked from the room, Beatrix saw she put out a groping hand suddenly before her to steady herself.

She must think, this was her one idea: tears were useless, she must not grow faint. As she turned the key in the door of the little Gray Room which she still used as a dressing-room, and sank

down on the floor at the foot of her little bed, she told herself that she had work that would take all her strength to do; and a settled prayer resolved itself in her heart that she might have power to accomplish it.

Dym was not sinking under her misery: she was looking it in the face with a calmness that was akin to despair.

The evening sunshine flooded the terraces and gardens, and streamed in at the window till the gray dress was streaked with bars of gold; the stars glimmered; the moon shone cold and clear; the night-breezes stole into the darkened room; and still the crouching figure sat on with its face buried in its hands. Twice only it stirred—once when they brought food to her door, and a feeble impatient voice had bade them set it down and go away, and again when verging towards midnight the clear sharp clang of the gate sounded in the distance, and firm footsteps drew nearer and nearer, pausing for a moment under her window and then passing rapidly round to the front entrance. As they died away, Dym shivered, closed the window, and kindled a light.

She had thought it out, and the time for her work had come.

"As there is a heaven above us, have you not lied to me in this?" she had demanded solemnly of Beatrix; but even as she asked it she knew that the bitter truth had been told her.

He was marrying her out of pity: the man's vast tenderness, his chivalrous nature, had prepared for her this degradation.

"Guy's weak generosity is his only fault: he is doing this for his mother's and his child's sake, and because he knows you love him," Beatrix had said to her, and the ground had not opened and swallowed her in her shame.

'No, she had not lied. Little by little the awful truth was stealing upon her. How white and drawn his face had looked in that twilight—that

evening—when he had come to her and pleaded for three days' grace; how grave and passionless had been his voice as he wooed her! with what settled sorrow he had told her that his heart was buried in Honor's grave!

Alas! she had thought that he had wanted her for his comforter—that he had found his hearth lonely, and craved for her woman's smile to brighten it. She would have been content with so little, she thought; she would have been satisfied with the merest crumbs of love. But that he should marry her out of pity! "Thank God, I will save him from that," she said, bitterly, as she trimmed her lamp.

Her slender preparations were soon made, and then she stole into Florence's room.

The child was sleeping peacefully, with one dimpled arm flung over the coverlet. Dym stooped down and kissed it softly. "Good-by, my darling," she whispered, as she turned away.

The first streak of dawn was stealing up the valley, and the pale line of light was widening behind the gray wall of Ingleside, when a little figure, veiled and cloaked, came slowly down the terrace, with the faithful collie following it.

At the lodge-gates they paused.

"You must not come any further with me, Kelpie." And as he licked her hand irresolutely she knelt down on the ground and hugged the dog to her bosom. "Oh, good old Kelpie, dear Kelpie, go back to him; you must not forsake him too." And her tears streamed over the rough coat and shaggy paws of her faithful companion.

Five minutes after that, the heavy gate had clanged between them. Guy heard it, and muttered drowsily to himself as he turned in his sleep.

"Good-by, dear happy Ingleside; good-by forever," she moaned, as she turned away, and the echo of her own heart went on ceaselessly, "Forever."

## JOY'S RETURN.

By GEORGE NEWELL LOVEJOY.

ONCE, in the agony of saddest grief,  
I cried, "Oh! is it worth the cost to live  
When happiness proves as a fugitive  
From the poor heart panting for joy's relief;"  
And bowed my head, while faster fell my tears,  
Unheeding that I had been seen by one  
Whose little life in ways ecstatic run;

Who could not know the griefs of older years,  
Until I heard the quick, yet gentle sound  
Of tiny feet, and felt upon my cheek  
The warm and loving kiss of rose red lips,  
And knew, at length, that all my woe was drown'd  
Amid the happiness I could not speak—  
The heart's dear rapture knowing no eclipse!

## SIERRA NEVADA.

## TRIANGULATION STATION No. IV., FREEL'S PEAK.

BY A TOPOGRAPHER.

BALD and beautiful, yellow in the shining sun, Freel's Peak stood against the southern sky, inviting us with the seeming warmth of its crest, so near to the sun, and repelling with its occasional acre of snow, gleaming in the distance like some pure blossom of alpine edelweiss. It was the outpost and ultimate limit of our season's travel. Could we reach it before the storms should come to chill and blind us? No, for climbing one side of its rocky comb, we met the wind coming up the opposite slope, whistling through the pinnacles and roaring in the caverns of the rock. And the wind soon brought rain.

It was a bad day for topography. To stand on the summit, it was impossible. Lean men that we are, waned thin by hard travel and harder fare, the tempest would surely have swept us out into the air, whose strong currents would have kept us afloat like angels or Ariels, and this, in our summer clothing, would have been uncomfortable.

The telescope of the theodolite rocks and vibrates and will not be quiet a moment. Through it, for accurate observation, the grand old mountains should stand in a dignity as motionless as the pose of a victim of the photographer's rack. Behold them now, however. They stand on their beads and deport themselves in a playful, mercurial, and unseemly manner; the mountains "skip like rams and the little hills like lambs," thus verifying the words of David, who, I doubt not, with all of his knowledge knew a smattering of topography. To add to our discouragement, Du Bois comes and makes adverse report. Thinking to build a monument in which to place our records, he piled up a column of stone, leaning, like a Pisa tower, against the steady push of the wind. But, alas, for his architectural plans, in a momentary lull of the storm it fell to the ground. So great was the gale.

Every profession has its own peculiar luck. It is the topographer's luck which gives him quiet Italian skies when he is down in the lowlands in camp, and beats him with a storm when once he presumes to thrust his head into Nephelococcygia. In view of this it is well if he be an artist or poet, or

something of that æsthetic sort, so that, in default of more scientific occupation, he may turn his telescope into a connoisseur's eye-glass, through which to contemplate the scenic splendor around him.

In order to be contemplative it is first necessary to be comfortable, and so, on the most sheltered side of Freel's Peak, we build a fire to temper the bite of the wind, which comes to us charged with fine splinters of hail. Flat on its rocky cap are the dry skeletons of some kind of evergreen tree, each of which, with a thousand fingers of branch and claws of root, clings as for dear life to its ungenerous ground. Down in the valleys these would have been upright and symmetrical trees, but tenacity and humility are the characteristics of the silva of the mountain top. From these we break fagots to feed a flame which wavers and darts, hither, thither, as the gusts blow, one moment completely deserting the bystander, and, in the next, enveloping him like an Isaac on the sacrificial altar.

Right here it may not be out of place to exclaim against those false ideas of the camp fire which are disseminated by gentlemen who sit by the cosy Latrobe, outfitted with cigar, slippers, and wife, and pen romance. In romance the camp fire is a mellow, moonlight sort of blaze, streaming towards heaven as directly as the flame of an acceptable thank-offering, and shedding a genial warmth and *couleur de rose* over the coterie of which it is the heart. It is supposed to promote the jest, awake the reminiscence, spice the dialogue, and loosen the tongue generally; to thaw out the cold and crabbed nature; to send all mosquitoes, coyotes, owls, and blue devils into that limbus where they belong; and, in fine, to combine the cheerfulness of the back-log with the solid comfort of the warming-pan.

There never was a greater error than this. Stripped of all poetic nonsense the camp fire is but a sneaking, deceitful thing, uncomfortable inasmuch as it vaguely hints of that comfort which civilized people, seated in family circle, enjoy. It is ever ready to play upon you its tricks, not mischievous, but mean.

Stand you before it, it darts out a sly lance of flame and shrivels your coat-tail. Stooping over it, a lambent tongue of fire licks off your whisker which has cost you a summer's assiduous cultivation. Stretch yourself by the side of it and try to read a paper, if it may be safe to predicate a newspaper at a camp fire. The light coquettishly deserts you—you pursue it, elbowing yourself closer to the burning log heap. With an instantaneous flash and wave of flame the blaze is upon you again, incinerating the printed sheet and scorching your eyes. It is a fickle thing, veering with the faintest breath of wind, and, when a dead calm prevails, getting up tiny draughts and currents of its own. It is perversely inconstant in temperature also, seeming incandescent on a mild evening and phosphorescent on the chill, frosty night. All this time it smokes profusely, inordinately, like any cottager's peat-fire. As for the men around it, neither are they types of pastoral purity; they are generally a hard and ill-spoken crowd, who weep, rub their eyes, trade positions, damn the fuliginous gusts, and tell bar-room legends until bed-time, which comes very early. Then precarious is the condition of him who sleeps by the side of the fire, for if he does not gravitate into the hot ashes before morning, the crumbling embers are sure to find him out and line his bed.

So, dodging the smoke and eluding the flames, whose forked tongues crinkle around our boot-legs, we begin the study of that great landscape of which the horizon is border and Freel's Peak is the centre. Misty and blue, we see the buttes of the distant deserts. At their feet, yellowish-white, though stained yet beautiful, are the alkali flats and the sinks of the rivers. Brown as burnt clay, unhandsome, and insignificant, stands a clump of hills some forty miles away; yet this is the dome of the world's treasury and is lined with the Comstock Lode. Better to look upon than the genuine mineral of the hills, however, are the stacks of barley, with their golden gleam, and the many streams of water, glistening like threads of silver, which are in the immediate prospect. Freel's Peak overlooks the Carson Valley, the rich green heart of a desert state, but it is from a vertical distance of more than a mile, and we are so high that the smoke of the steam threshers at work is dissolved and lost long before it reaches us.

It is after harvest time now, and from our

height the plain seems a mosaic of tiny rectangular blocks, white, green and brown, stubble, grass and fallow. Earth's mantle is here a piece of patchwork, and not a robe of emerald plush, as poets would have it. But it is none the less beautiful for its admixture of russet, drab, and straw. There is especially great beauty in a field of barley-stubble which is yet clean and unstained by the alternations of storm and sun. It is the white apron of Ceres, from which she has lately poured her gifts into the barns of the farmer-man.

Over the valley an occasional cloud of the impending storm scuds by, seeming to push its shadow before it, and bringing a transient blot of darkness upon the scene. Through the valley run the several branches of the Carson River, which, issuing from their gates in the foot-hills, seem stricken with a sudden indolence, linger, and are loth to leave these cool boundaries of paludine field. Now I can realize why the fanciful ancients attributed intelligence to the rivers and gave them gods and naiads for people, for surely these streams know of the sink in the desert which awaits them, and this is why they wander in ways so crooked and uncertain, following meanders as reluctant and slow as of culprits going to doom. Try to trace the course of one of these, and see how it doubles and worms about, and is recalcitrant to the steady force of Nature which compels it along. It is a pitiful sight, that of Nature's strongest law, gravitation, coercing one of those fair children of hers, the mountain streams, into the mouth of that monster, the desert. In this she is as cruel as those heathen mothers who cast their babes into the arms of Moloch.

The refrain,

"For men may come and men may go,

But I go on forever,"

is not sung by the brooks of Nevada. Even if they escape their original destiny, the desert, it is only that they may do menial service for practical man, by whom they are entrapped into a sluice, and made to wash the miner's dirt; into a ditch, to water the farmer's field; into a flume, to do burthen work for the lumberman in the floating of his wood; into a race, to turn the sawyer's mill-wheel; or into the aqueduct which feeds a city, where they are used by the Chinaman to wash his clothes, and by the restaurant cook to boil his vegetables. All around the eastern slope

of this eastern summit of the Sierra Nevadas there are icy streams in every gash and furrow, seeping through the rock walls of that great reservoir, Lake Tahoe; and all around the mountains, a continuous cordon of pitfalls, runs a voracious flume, never full, to which these brooks are feeders and from which the water runs through iron pipes across the valley and over the mountains to Virginia City, whose utilitarian people are stripping the sierras of their timber and draining them of their lakes.

Pass the panorama on. Now we scan the northern limb of the horizon. At our feet lies the chromatic surface of Lake Tahoe, over which an illusion of shifting colors is at play. Not any of the silks of the East can show a sheen as exquisite as this, and not any of the palaces there can boast a floor with hues so rich, so intricate, and so involved as those which lie at rest upon its rocky bottom. It is a wonderful lake, this Tahoe, wonderful in its purity, which seems to keep pace with its depth, which reaches far down into that abyssal zone to which the naturalists have assigned the nethermost waters. It is so deep that an adit projected into the mountains from that low plain, the Carson Valley, would tap it and drain it; and yet so exalted is its place above the other lakes of the earth that its surface is at greater altitude than the summit of Mount Washington. A hundred streams flow into Lake Tahoe, and yet its chalice is never full. They come from those perennial drifts which frost its serrated rim, which is worked most royally into needles, knobs, cliffs, crags, and cones, making this a cup fit to be beaker to the greatest of the gods. They go, alas! to their doom, finding it in Pyramid Lake, a hundred miles away, which, with a strong river for an inlet, has no outlet except, perhaps, some hidden *descensus Averno*.

Looking down from this aerie, as in gazing at length upon Church's picture of Niagara Falls, you are soothed into that passive state in which you fancy that you hear the sound of the water; but this is only a trick of the imagination, assisted by memory of what you have heard. Looking more closely, there comes, from all around the edge of the lake, a white glint which is neither from the caps of the waves nor the foam of the low breakers there; it is from the rafts of flotsam timbers which are huddled in the little bays of the coast. Once these were forest trees, but it

was many a year ago, and now the giant trunk is reduced to a slender mast, the fallen limb is no larger than a shepherd's crook, and the broken log is like the hulk of a child's sailboat. So long have they pounded each other that their surfaces are like a padding and a protection of soft splinters, and still the remorseless conflict goes on. Fain would they escape to open sea, where all is roomy and free, but they cannot; they are restrained by a force which is stronger than the firmest boom. To them the waves are not shepherds, but jailors, and seem to take merciless delight in driving them with ceaseless beat, beat, upon the shore; and as convicts, persecuted by their keepers, take unsatisfactory revenge in striking one another, so do these prisoners wear themselves out in internecine war.

O, I have great pity for these fallen forest trees, now reduced to thin skeletons of their former selves. White as the ghosts of drowned men they lie, restless as souls in purgatory fire; and seeing this disordered flotilla, ghastly in the moonlit air, it is hard not to believe that the sea has relented at last, and at last has given up its numerous dead.

This is California. Westward from this meridian line of mountains the green spurs fade away, in gentle declivity, down to the level of the ocean almost. At the horizon or thereabouts they join a band of hazy saffron color, which may be readily mistaken for a streak of sunset sky; it is the Sacramento Valley instead. Above it is another zone, this time blue, whose upper line is notched and scalloped; it is the profile of the coast range of mountains, of which Diablo is king. Thitherward flow the numerous branches of the American River, which, of all the rivers in the world, most deserves the title of Chrysorrhoas, for along the banks of these lie the great gold fields of America, where, in 1849 and after years, men washed, and gambled, and died, and went on into a history which sounds like romance. Somewhere over there lie Placerville and Amador; also Fiddletown, Bottle Hill, Blue Tent, and Pinch-'em-Tight; likewise Camp Far West, Rough and Ready, and You Bet, or at least what remains of these towns of the suggestive title.

As in looking on a battle-field over which the green grass has grown, it is hard to realize what hopes have prevailed and what pulses have throbbed in the cool depths of that great verdant slope; for the fires of a miner's excitement are never dead,

and his blood is never cool, even though he be knee-deep in a ditch of snow-water. A ruined rocker, a segment of sluice, a perverted brook, these are all that remain, and the trees, whose shadow is sympathy, and whose touch is compassion, are year by year stretching their arms farther across the empty clearing, the roofless cabin, and the desolate grave.

Pass the panorama on. Now the telescope, moving in obedience to the continuous wind of the tangent screw, is upon a group of mountains whose lawless upheaval gives promise of another kind of mineral wealth, that which is found in the quartz rock. These, seen from afar by the prospector, would be a charm to his eye and a magnet to his course, and apparently with reason, for one of these is Silver Mountain, another is The Silver King, Silver Lake lies near by, and Silver Creek is a part of the neighboring geography. As for Silver City, if it is not yet built it is already laid out—in the brain of some scheming speculator. Significance in geographical nomenclature is a most excellent thing, and for that reason this chaotic section is called Alpine County, California.

There is nothing stereotyped in the expression of these peaks, and as for the law of the natural slope of earth, they practically disprove it. They tower in crags, project in cornices, and overhang in horns of rock. At a distance such mountains seem awful and impregnable, and to the topographer they are as a prophecy of hard labor over perilous routes, but it is all an illusion of the sight. Those ledges are few up which there is not some kind of a foothold and stairway. Mountains, like great men, are more imposing at a distance. When Major Pike discovered the peak which now bears his name he shrank from it in awe, or else with an affectation of awe and that optimistic estimate which so often characterizes the discoverer, and penned these words in his diary:

"The summit of the Grand Peak, which was entirely bare and covered with snow, now appeared at a distance of fifteen or sixteen miles from us, and as high again as what we had ascended, and would have taken a whole day's march to have arrived at its base, when, I believe, no human being could have ascended its pinical."

To those who have seen that great, round, elephantine lump of earth, Pike's Peak, these raptures about its "pinical" are certainly very entertaining. At this day men live on its summit, holding vigil

in the scientific observatory there, and timid ladies, on picnic bound, ride thither without danger of translation into the skies.

Continuing his chronicle, the explorer wrote:

"The perpendicular height of the mountain from the level of the prairie was 10,581 feet, and admitting that the prairie was 8,000 feet from the level of the sea, it would make the elevation of this peak 18,581 feet."

Alas! how has the mighty fallen in the seventy years since these words were written. Under the test of repeated and accurate measurements Pike's Peak has dwindled to a height of fourteen thousand two hundred and some feet. In the meantime, others, newly discovered, have arisen and overshadowed it, until it is no longer one of that triumvirate of peaks which overlook the mountains of the West. These are Sierra Blanca and Uncompahgre Peak, of Colorado, and Mount Whitney, in California. The altitude of each of these is about 14,400 feet; which is the highest of the three is yet uncertain, but the odds are turning in favor of Sierra Blanca.

It is from this quarter, Alpine County, that the storm, now so imminent, is coming. It is no sudden and unforeseen gust, but has been organizing its forces all day long and practicing them in those evolutions in which the armies of the sky are drilled. Then it stationed them, like battalions at rest, all around the southern horizon, hanging them, cloud by cloud, on the lofty mountains there. It is then, when wrapped in turbans of mist, that the peaks are at their grandest. They seem to be the bases of Babel towers which must go on and on and pierce the highest heavens. When anything is hidden from the human mind, the imagination is quick to pierce it out, finishing it with good or bad material according to its own desires, and hence comes disappointment, very often. Do you remember the Veiled Prophet of Khorassan, and the cruel disenchantment which followed his unmasking? Just so with these mountains, upon which the clouds are low; their promising slope at the base hints of an immensity of height, and when the veil is lifted and an insignificant hill is revealed, the enthusiastic observer cannot but feel that he has been imposed upon.

Great curtains of cloud, rolling and unrolling as they go, move in silent majesty along the west. Flecks and scuds of cloud are chasing each other in quick succession over the Carson Valley, afford-

ing, with their shadows, a pleasant chiaro-oscuro checker upon its surface. An arc of rainbow, a mere fragment, apparently but a few feet in length, hangs over a vagrant tuft of cloud, like a bird of brilliant plumage at poise in the air. Half of the world is in the brightest sunlight, half in the blackest shadow, and, we shiver as we note it, the darkness is gaining ground.

On Lake Tahoe the influence of the storm begins to be felt, and the dismal vapors gather, ready to bear their part. They assemble, not in tufts, with feathered edges, but in a bank so dense that it seems to have its distinct topography, like so much of solid land. On the south it is an abrupt bluff, black as a ledge of basalt, to which it is very similar, and even from our standpoint, nearly a mile above it, this unsubstantial cliff seems to be several hundred feet in height. Across it there straggles a streak of white light, like a vein of silver splitting a mass of volcanic rock. To the north and east it is a plateau, sloping slowly down into the water, of which it seems a portion. Indeed, it is hard not to believe that this is an immense, but placid upheaval of water, and that it is the beginning of some great cataclysm, into which it will break and destroy the little settlement on the beach. Or perhaps it is the base of some water spout to be, and that black winged cloud approaching will drop down its tongue, and, having drunk its fill, go its way to break against the mountains in a "cloud-burst." But these apprehensions are dissipated by a little vessel, with white sails and steady motion, which flashes out into the sun, from the depth of the mystery behind, proving that it was only thin mist after all, which, looking a second time, has vanished completely, leaving the lake as level as it was before.

Now the grand onset of the gale, coming as fast as a horse can run, is here. The heavy clouds are breasted and fringed with thin, pointed streamers, relentless as bayonets in a charge. They sting

with their burden of snow, rain and hail. They are followed by breakers of mist, rolling, seething, surging, howling in the caverns of rock, and whistling over the cliff edge. No living thing can stand before a wave like this; it is time to beat precipitate retreat. The mountain-side, between us and camp, is a very steep talus of heavy sand, the sand of disintegrated granite. Down this we plunge, ten feet at a stride, dislodging at every step a petty avalanche of earth, and riding thereon until its motion becomes too provokingly slow.

Everywhere around is the gray obscurity of premature night, and it is with surprise that we see, as we reach the doors of our tents, the sun break through his veil with a flash of light, and throw a parting look upon the earth which he is leaving. It is the lover's last kiss to the sweetheart he is leaving.

And the earth blushed, like a sweetheart, under the sun's last kiss. A pine tree stood before our camp, a short stone's-throw from it. Against this a rainbow grew into shape. Its foot was at the foot of the tree; its arch leaned against the cone of foliage, and that pine, usually of a sombre and uniform green, took on all of the tints of a New England forest in autumn. How beautiful! my comrades said, but I thought of more than its beauty; I thought of the pot of gold which lies hidden at the foot of the rainbow, and for which I had searched so often when a boy. But those, the rainbows of the Eastern lowlands, were dim and always distant, and the chase of them was an unsatisfactory one. While, as for the foot of this mountain iris, I could see it burnish the ground within a few feet of where I stood.

Some day, when my debtors become importunate, I shall return thither and sink a shaft at the fortunate spot revealed to me by the rainbow. I shall know it again, for I have marked with a peculiar blaze the trunk of the tree where it stood, and this is not far from the foot of Freel's Peak, Triangulation Station No. 4.

## QUITZOW—THE STORY OF A HERMIT.

By F. B. STANFORD.

"Of course it is true that dead men tell no tales," I said.

He looked at me strangely a few moments, and then asked what I meant by saying that; had I any meaning?

No, I could not say that I had any particular meaning; the loneliness of the place had prompted a disagreeable notion.

I wondered the next day, when I thought considerably about the man, that the old saying should have come to me just at that time. But the fact is, the man produced an unfavorable impression when one first saw him. There was the thick wood behind us, the falls in front; not a sound anywhere, except wind and water—nature humming her various tune. If, however, he had answered my questions when I came toward him, or if he had spoken at all in place of staring listlessly at me, probably I should have thought nothing bad of him.

His appearance was that of a back-woodsman, of ordinary height, with a compact body, a large head and face, the latter very nearly concealed beneath a thick yellow-gray beard. His red flannel shirt was unbuttoned about the neck and chest, which were well tanned. He wore an old beaver hat that had lost its shape long since.

When I spoke to him, he was lying on the ground apparently looking only at the sky and the clouds. I explained that I was one of a company encamped somewhere in the vicinity, exactly in which direction I could not say, as I had been wandering in the woods since morning, and had lost my way. To all this he said nothing. He only arose, stepped back a yard or more, and looked at me fixedly. At first I thought he was deaf.

But he spoke, after a while, slowly and distinctly, at the same time leaning against a tree. He had a shanty just beyond a clump of brush. Had lived there alone a number of years. Was I quite sure I didn't know all about it? Why, of course I was sure I didn't know all about it? So our words ran on until something was said which suggested that in such a place a dead man would not be likely to tell any tales. After I had spoken my

thought, he was nervous, and requested me to wait outside his shanty until he had been within minute.

The hut was simply one large room, with a fire place dug into the bank of earth at one end, and built up at the sides with stones. There was a rough pine table, two or three stools, a bunk on one side of the room, and an old melodeon, with one of its pedals broken. He had a great many small articles on various shelves here and there which I will not attempt to enumerate. The most of them had been picked up in the woods or gathered from the lake. One, though, would give only slight notice to these, or to the old books on the table, for immediately over the hearth, on a curious willow shelf, set a human skull facing the door.

While I stood mutely looking at the thing, he watched me with a sidelong glance. And when I ventured to ask why he kept such a grinning ornament in so conspicuous a place, he poised his chin in his hand, resting the elbow on the other arm across his breast, and looked steadily at me.

Why should he tell me that? Didn't I know quite well enough where it came from?

This unaccountable reply, coupled with the man's mysterious manner, began to produce an uncomfortable feeling. Of course I hadn't the slightest idea whence the skull came, or who the man was. To despatch matters, I said a second time that I was hungry, and would pay him for something to eat.

"Money!" he said, with a forced laugh, and at the same time opening his closet; "I don't want your money, sir. I get on very well without the sort of thing."

While I was helping myself to his cold potatoes and gray squirrel, he replenished the fire, and sat down at one side of the hearth to watch it sputter and sparkle. Daylight was just beginning to fade and the air with the approach of twilight had become chilly. There was a slight wind rustling the leaves and trees.

I asked him if he never felt lonely living so far removed from any one.

"No," he answered, thoughtfully; "or, that

to say, I never have felt lonely on that account until within a few weeks." Then, after a pause,

"You are the only man I have seen in a year."

"So long as that?"

He looked at the fire abstractedly, as though he had not heard my expression of surprise. But when I had finished my meal and moved back from the table, he said, still looking at the fire:

"Perhaps if I talked to some one I should work it off. Hark!" looking earnestly at the skull,

"You didn't hear anything?—I mean a step?"

"No, nothing only the fire and the trees."

"No, no, of course you didn't. I am growing old—sixty-seven last spring—and my hearing is failing. My name is Quitzow, old Quitzow. I have lived here a long time."

"Pardon me," I said, "for seeming inquisitive, if I ask why you came to live here."

"No offence at all, sir. I think it will do me good to talk. Macgrew always said I was a man too silent to go on well in the world. That was Macgrew," he said quietly, nodding in the direction of the skull.

This information startled me a trifle. But he went on, without taking any notice of me, in his low, subdued voice.

"I was educated with Macgrew in Montreal, and we attended medical lectures a long while; my father and grandfather were both physicians before me, but I have no fault to find. My life has been just what I made it, just what Macgrew and I together made it. I don't take any offence at anything, sir. I know about what I am, and I am satisfied."

After saying so much, he again fell into silence. Though he had encouraged me to ask him whatever I chose to, I now preferred to let him take his own time in telling me what he might be pleased to. The surroundings were favorable to excite my interest in him. The bright firelight playing hide-and-seek with the shadows which had made their appearance as stealthily as the daylight, had withdrawn; the grotesque aspect of the furniture huddled in such a place; the consciousness of the gathering gloom without; and, more than all, that grim, hideous skull, now warm with the glow from the hearth upon it, then dark and saturnine out of the light.

"I suppose you belong to the big world?" he continued. "What's the news from the world, anyhow? There haven't been any more wars or anything of the kind going on?"

I said no; that our part of the world was enjoying peace.

"You see, men came up here into the woods to avoid the draft when the North went to war with the South. I am not likely to forget that, I think. No. Macgrew and I never had any trouble with a living soul—never until those men came here. We came across the line to the Aroostook in '50, and cleared a farm for ourselves. We ought to have staid on it. I always said so, but Macgrew soon tired of farming, and wanted to join a community, the Shakers or Quakers. Finally we came here to Moosehead Lake, and lived in our own way apart from everybody."

He changed his position, placed his elbows on his knees and rested his chin on his clenched hands.

"Well, sir," after a few minutes, "I've lived here ever since."

"And Macgrew—did he stay here also?"

"Macgrew?"—turning his pale face toward me, "they murdered him, the one man of all the world. That was Macgrew," nodding again at the skull.

He arose and went to the door, opened it cautiously, and looked out. Whether or not he again imagined that he heard footsteps, I cannot say. I heard nothing; but the darkness reminded me that it was time I should return to camp.

So I stood up, looked over the books on the table, and tried to talk about them a moment.

"Perhaps"—he said, hesitating, when he had shown me the right path to follow, "Perhaps you can come this way to-morrow evening?"

I said that I would.

"Well, good night," putting out his hand.

"One moment, though, sir," as I was moving away. "You will come alone, I think?"

Yes, I would come alone.

As I went on among the thick trees nearly a half mile, I frequently stopped to listen and look behind, though I don't suppose any footsteps were following me. The next afternoon I failed to keep the same path, and lost considerable time, so that I did not come in sight of the shanty until dark.

The soft glow of the hearth-fire shone out from the window. And he was playing some hymn, I know not what, on the sad old melodeon. By-and-by—for I waited and listened—he joined his voice with the instrument, losing himself, as it seemed, in some half-forgotten melody. When

he was done, one must have known him the better.

He came to the door as if waiting for me, and I approached. His greeting was quite free and easy, and his face was more cheerful than on the previous evening. He had, moreover, removed the skull from its willow shelf to an upper and dark corner of the room.

"I may as well tell you, sir," he began, when I had seated myself at one side of the hearth and opposite him, "that when you first came here yesterday I mistook you for something or somebody else. It is a matter I can't quite make out; and I said to myself that if you would come again, I would try to tell it to you."

I expressed the interest I felt to share his confidence; and after a few minutes, in which he appeared to be searching for a beginning, he continued:

"It must be about two years now, I think; yes, two years, though time goes a great deal faster the older we grow. But I mustn't begin there; I must go further back than two years; about ten years last winter. That was when it happened, though I can't say on what day of the week it was, or what hour of the day or night. Macgrew used frequently to wander off alone, and remain away a day or two. He had a great love for these old woods, and could bring himself nearer to them when alone.

"He cooked the breakfast that morning; and after we had passed an hour or more reading, talking about religion, Fourier's social ideas, and some other matters, Macgrew went out with his rifle. The morning was sharper than usual, and I expected him back at night; but he never came back to me again, sir. God help me! I waited and searched, and looked high and low for him."

His voice sank low, and he stared at the fire some time.

"It was three years afterwards when I found that," glancing over his shoulder at the skull in the dark corner, "and I brought it home. I had always doubted the truth, and was expecting him every day. A drowning man, you know, will grasp at a straw; but when I found that with the great board-nail driven into it, my last hope was gone. I didn't accuse any one; I only knew that somebody had done it, that it was a fact. So I placed it up there on the willow shelf to be near me the long winter evenings. It was seven years

ago; I've had a great many long nights since then."

How the firelight flickered! As he sat there with folded arms, with his gray head dropped forward, the kindly warmth seemed to give his features a softer, finer finish. Possibly the lines of his face were weak somewhere; I don't know. When he waited I waited, putting in no word to disturb the current of his thoughts; for, now and then, I observed his dreamy far-away look at the coals, and imagined that he had forgotten my presence.

"As I began, it was two years ago—one October afternoon. I was out on the grass, looking at the lake and the sky. It had been some time since I had seen any one—the lumbermen go away in the spring—and I was glad to see the man. While we talked about the game and so-forth, it struck me that I had seen him before, possibly with the driving gang. But he had never been in the woods with the men, he said; had worked at rafting at one place and another; was from Bangor just then, and had come up here to hunt. That was all a lie. What brought the man here, God only knows. Yet it may be that the place had a fascination for him. I have read something of the kind.

"We sat on the grass there until nearly dark. He was smoking and talking interestingly enough. After a while we came in here. I know now just how the room looked. I had been moving the things about to clean the floor. The skull was flat on the table, where all the light from the window fell upon it. It was unusual for it to be in just such a place.

"You, sir, looked at it yesterday as he did for a minute or two. But—while standing there and holding fast to the door, *his* look deepened into something awful. Hush!—didn't you hear that step, now?"

There was not a sound.

"It—the skull, sir—turned over on the table face toward him, and he caught sight of the nail in the temple. Then he cried, '*Macgrew!—Great God!*' and dropped down dead."

"But the skull—are you certain that it turned over?"

"As certain as I live. It terrified that man to death."

It was a riddle; and after we had been silent a long time, it occurred to me that some living thing,

a mouse perhaps, had been inside the skull at the time. He admitted it might have been so, though I could see that he had little faith in such a theory.

We now went out doors. The moon was coming up round and red, tipping the great hemlocks with a silvery sheen. As we walked along my way through masses of wild trees and clambering underwood, I noticed that he was on the look-out for somebody or something.

"Perhaps it is you, sir, that drives it away," he said, at length, looking inquiringly at me. But I have heard it once."

"What is it you have heard once?"

"That is the trouble, to tell what it is. I thought yesterday that you must be it. That was the reason I went into the shanty before allowing you to, and placed the skull so you should see it plainly. For the last time the thing appeared in full shape, it fell at sight of the skull and vanished."

I tried to convince him that the phantom was only an hallucination, nothing but a morbid fancy brought about by living alone and brooding over the tragedy of his friend. That was all very well for me to believe, he said; he knew something about that kind of derangement.

"But, sir," he continued, "there is meaning of some kind in this. I think it is a warning, but I cannot make it quite clear. You see, the first time I saw the thing was a month ago. I was

standing under a big hemlock in the gully just yonder. Suddenly it started up not more than two rods before me, a red-shirted, bearded man, as plain as ever I saw anything in life. It threw up its arms this way over the head, as if something was about to fall. Then it made signs for me to run."

He was loth to believe that this was all some optical delusion. The apparition made its appearance oftener now than a week previous. Sometimes he saw it on the bank of the lake, sometimes it would prove to be following him in the woods; but wherever he encountered it, the spectre never failed to go through the same pantomime with its arms. And the footsteps were always audible.

When we parted at an opening in the woods, it was arranged that I should return to him after a week, the time our party had set to strike camp. He thought that he would try to go away with us; but he was uncertain. It had been so many years that he had lived there, he might leave the remainder of his life behind him. Standing in a patch of moonlight, he watched me as I went away into the shadow and out of sight.

I never again saw him alive. In death he lay with his arms over his head and face, just as he had thrown them up hastily to ward off the great tree which the lightning had hurled upon him. I called to mind then with awe that the spectre had thrown up *its* arms the same way many times.

## ERRORS IN SCIENCE.

NOTWITHSTANDING the vast strides that science has made of late years, it is curious to note the errors and misconceptions in the various points of natural history that still linger in many parts of this and other countries. We may run over a few of these popular misconceptions. Not a few even among generally well-informed people still imagine that all *Fungi* are poisonous—including even the mushroom. Many more take it for granted that all serpents sting, and that the forked tongue is the weapon by which the "sting" is given; the fact that it is forked seeming to afford them convincing proof of its deadly character. While there are many among the educated classes who would

probably be puzzled if told that there were other mammals besides four-footed animals and man.

There are still numbers of persons who believe that a horse-hair immersed for a time in water becomes vivified and is transformed into the curious animal known as the hair-eel; and who further imagine that this, acquiring greater thickness, becomes in process of time the common eel. This belief is universal among the uneducated, at least of the rural population, in many parts of the country. Nor is it confined to them. We have heard it stoutly maintained by a very intelligent man, of good education according to the ideas of education which were generally entertained fifty or sixty

years ago; his only argument was one with which, if he had not been profoundly ignorant of natural history, he could not for a moment have deceived himself. He had often seen, in ditches or stagnant pools, a moving hair-like thing, exactly resembling a black or dark-brown hair from a horse's mane, and no doubt it was a living thing, *and an eel!* And the other day we read among the answers to correspondents in a weekly paper, a very good advice to one who had directed attention to this same marvel—to try the experiment for himself with a horse-hair. But for any one who seeks information in the proper quarter, there is no need of such experiment; and the needful information is easily obtained. A few hours spent in the perusal of a book or two of natural history would make any man of common sense ashamed that he had ever for a moment credited such an absurdity. The natural history of the eel is well known; and at no stage of its existence is it in form and appearance like the hair-eel. The natural history of the creature called by this name—the *Gordius* of naturalists—is also known. It is not a fish like the eel; it belongs to a class of parasitic worms very far below fishes in the scale of creation. It has no relation either to the eel or to a horse-hair. Yet the plowman looks upon it with wonder, as he thinks of what he believes to be its origin; and the boys of the village school, when they find it in the gutter by the roadside or millpond, gather round it to gaze, and assure themselves by ocular observation of the truth of what they have heard. Ought they not to hear in the school itself what would disabuse their minds of so gross an error?

The erroneous opinion that all serpents are venomous, is one that most probably originated with those who live in districts frequented only by the adder or viper; but it ought not to be entertained even by the most ignorant of the peasantry where the common snake is abundant, as it is in most parts of England. There every one ought to know that the latter is harmless, and that it is easily distinguished from the viper, which is poisonous. Curiously, too, the blind-worm or slow-worm, which, although not now ranked by

naturalists among true serpents, but among the lizards, agrees with serpents in general appearance, and is in many places regarded with the utmost dread, being popularly believed to be as venomous as the viper itself. This is the case equally where it is common, as it is in many parts of England, and in Scotland where it is rare and found in comparatively few localities. "During the summer of 1876," says the Rev. J. G. Wood, in his "Illustrated Natural History," "I passed some little time in the New Forest, and having gone round to the farms in the neighborhood, begged to have all reptiles brought to me that were discovered during hay-making. In consequence, the supply of vipers and snakes was very large; and on one occasion, a laborer came to my house bare-headed, his red face beaming with delight, and his manner evincing a consciousness of deserving valor. Between his hands he held his felt hat tightly crimped together, and within the hat was discovered, after much careful manœuvring, the head of a blind-worm emerging from one of its folds. As I put out my hand to remove the creature, the man fairly screamed with horror; and even when I took it in my hand, and allowed it to play its tongue over the fingers, he could not believe that it was not poisonous. No argument could persuade that worthy man that the reptile was harmless, and nothing could induce him to lay a finger upon it; the prominent idea in his mind being evidently, not that the blind-worm had no poison, but that I was poison-proof."

Similar to the popular opinion as to the blind-worm, is that concerning the little active slender lizard common in moors, and that concerning the eft or newt, both of which are deemed extremely venomous, dangerous animals, whilst in reality both are quite harmless. We do not know how far the error as to the lizard prevails in England, but it is certainly very generally prevalent in Scotland, almost every rustic dreading what he calls an ask, that is a lizard, nearly as much as an adder. And a similar belief, equally erroneous, prevails in France as to another species of lizard.

## NOTES AND QUERIES.

**Banquet.**—Having noticed at different times in the NOTES AND QUERIES department of POTTER'S AMERICAN MONTHLY responses, interesting and valuable to the reading public, I am induced to seek information through the same channel, concerning a subject on which a friend and I have had considerable discussion, and without reaching a satisfactory conclusion to either of us. I have held to the opinion that the word BANQUET signifies, in its true sense, "a light entertainment at the close of a feast," while he maintains that "Banquet implies in its original and present sense, *never a light, but a rich and heavy feast.*" Which of us is right?

CHARLES E. MILLER.

We answer our inquirer as satisfactorily as space permits. Both you and your friend are right in a limited sense. The word *banquet* is derived from the French. In Italian it is *banchetta*, and in Spanish *banquete*. In its original it signifies feast, a small bench, a little seat, a stool with three legs, and implies the idea of a sitting, hence a feast. Some authorities say BANQUET means a *rich* entertainment; others define it as simply a *dessert* or light repast. "There were all the dainties, not only of the season, but of what art could add, venison, plain, solid meat, fowl, baked and boiled meats, *banquet* in exceeding plenty, and exquisitely dressed."—EVELYN. Among the Hebrews it was a festal entertainment of a religious character; thus they accompanied those great solemnities of worship when the people were to appear before the Lord in the place where this sanctuary was. These feasts were usual also at the ordinary sacrifices, and besides, at the making of covenants. The more domestic occasions on which banquets were given, were at the weaning of children, at weddings, on birthdays—especially those of kings—at certain rural anniversaries, as sheep shearing,

harvest vintage, at funerals, and in the exercise of hospitality on the arrival or departure of friends, or even strangers.

ORIENTAL STYLE OF DINING.

Banquets were generally held in the evening, and the beginning to feast early in the day is censured.

It is elsewhere recorded that invitations to these banquets were sent by servants, and proper preparations were made by killing oxen, mingling wine, and furnishing the table. The custom in those ancient times was, to extend a second invitation to the guests when everything was ready. Dr. Thomson says, "This practice survives to the present time, not very strictly among the common people, nor in cities where Western manners have greatly modified the Oriental, but in

AN ORIENTAL BANQUET.

Lebanon it still prevails. If a sheikh . . . invites, he always sends a servant to call you at the proper time. This servant often repeats the very formula mentioned in Luke 14: 17: 'Come, for the supper is ready.' The fact that this custom is mainly confined to the wealthy and to the nobility is in strict agreement with the parable, where the certain man, who made the great supper and bade many, is supposed to be of this class.

It was the custom in those times that guests were bound to appear in appropriate and becoming dress. Sometimes the master of the house bestowed robes on those he entertained. This was of course not the prevailing custom, but more particularly was confined to monarchs and those of rank. An Oriental monarch now presents a robe of honor to persons admitted to his court. Then guests were received with a kiss; rich perfumes were poured upon their heads, beard, clothes, and sometimes feet, and they were, it would seem, occasionally crowned with flowers. Persons were arranged at tables at which the ancient Hebrews sat, though afterward the custom of reclining was introduced, according to the rank and honor intended to be given.

Thus, we are told that far back in the centuries BANQUETS were pretty much as they are now, except as to the form and style of ceremonies. Then, as now, they were distinguished for their sumptuousness, the daintiness and profusion of the viands, the richness of the wines, often mixed with spices, and the music and dancing. Our illustrations show an Oriental Banquet, and the usual form of dining. One of the distinguishing features of the later day banquets, is the offering and responding to toasts. In the United States they are frequently made the occasion to get before the public views of State or national import. The idea is certainly a happy one, as subjects of general interest are, in a more familiar way than usual, discussed and brought to the consideration of the people.

Reverting to the origin of banquets, we would state that the Eastern nations were much given to hospitality; and hence we read frequently in Scripture of the feasts given to friends. Many of them, indeed, bore a certain religious character; as when the Israelites went up to appear before the Lord, they were to feast in his presence, calling in the widows and fatherless, and other poor, and the Levites, to rejoice along with them. Deut. 12: 17; 14: 22, etc. In these earliest notices, we find males and females mentioned as meeting together at the feasts. In the later times the separation of the sexes appears to have been common, as it is at the present day in Palestine and the surrounding countries; yet, in the Gospels there are traces of the greater freedom which is preserved

by pure morality. John 2: 1; 12: 3. From the parable of the marriage feast (Matthew 12), we may conclude that practices prevailed at formal magnificent banquets in our Lord's time, such as are reported by travellers to be still in occasional use. Before the time of our Lord, however, as before mentioned, the Jews had adopted the luxurious practice, which was in use also by the Persians (Esther 7: 8) and the Romans, of *reclining* upon couches, though this is not expressed by our translators. This explains how it should have happened that the women came behind the couch where Christ lay, and anointed his outstretched feet. Luke 7: 37.

It is recorded by Isaiah, 25: 6, in his "feast of fat things, of wine on the lees." Drinking wine is also mentioned in the history of Nabal's and Absalom's sheep-shearing feasts; though it is worthy of being noticed that Nabal, who grew "very drunken," and over whom there came such a fearful change when "the wine had gone out of him," made no mention of wine in his account of his preparations; he merely said, "my bread, and my water, and my flesh that I have killed for my shearers."

We are also told of strangers being invited to an earlier meal, called dinner, though it perhaps more nearly resembled our lunch. Luke 11: 37, 38; 14: 12. The meal in those days was no doubt eaten, as it is at present in the same countries, without the use of any articles like our knives, forks and spoons. The hands were dipped together into the dish. Mark 14: 20. See also Proverbs 19: 24; 16: 15, where "bosom" is a mistranslation; it ought to be "plate" or "dish." Therefore after meals the hands were wiped with a cloth, when water had to be poured over them, II Kings 3: 11; or according to a Greek practice, they were rubbed clean with pieces of bread, which were greedily devoured by the dogs under the table. The whole custom relating to banquets or feasts in many aspects appears to us curious, and in some respects instructive. Judging from an American point of view, we certainly have greatly improved on the model of ancient times.

#### Something of a Curiosity.—

A contributor to the AMERICAN MONTHLY sends us a bank note for five dollars, signed by Stephen Girard and made payable to Lafayette. The note is very thin and much worn, and no doubt is genuine. It is numbered 1329, and reads as follows:

"I promise to pay La Fayette or Bearer on demand at my Banking House in South Third Street, Five Dollars. Philadelphia, July 7, 1813.

(Signed) STEPHEN GIRARD.

J. ROBERTS, Cashr."

NOTE.—In the date 1813, the 13 is so defaced and obscure that it cannot be stated positively as 1813. QUERY.—What is the present value of the note, and where can it be exchanged? To the Antiquarian societies it would certainly possess a certain historic value. Cannot some of the readers of POTTER'S AMERICAN MONTHLY give the desired information to the Editor?

**Strange Facts about Surnames.**—We cheerfully give room for the following contribution to the NOTES AND QUERIES of the MONTHLY: Among the many curious changes wrought in the history of the American people, none are more striking than those which relate to the surnames of the different members of certain families. These changes occurred so rapidly during the first century of American history that we are forced to give credence to those of more magnitude reported to have occurred in the surnames in the Old World.

Whenever, we are told, William Penn could translate a German name into a corresponding English one, he did so, in issuing patents for lands in Pennsylvania: thus the respectable Carpenter family in Lancaster are the descendants of a Zimmerman.

Many Swedish and German names have suffered changes: from Soupli has come Supplee; from Up der Graeff, Graeff and Updegrove; from Hendrick's son, we have Henderson. The district of Southwark, in this county, covers ground once owned by a Swede named Swen. His son was called Swen's son, from whom the Swanson family derived their name. The Vastine family came from a Van de Vorstein.

A person whose family name was Sturdevant, Englished into Treadway a few years ago; and a family which during the Revolution spelt their name Boehm, have softened it since into Bumm.

BUTLERS TO THE BANQUET.

Occasionally a French name is translated. One of two brothers, residing close to the Quaker City, is known as Mr. La Rue, the other, as Mr. Street. The corruption extends to New England, and some are changed from the French Acadian, to wit: Bumpus is derived from Bon pos; Peabody, from Picbaudier; Bunker, from Boncaer. In the Western States we have some curious transitions: The family name of Hodge has in some places branched off into Hedger; Zinger, into Zombro; Stevens, into Stevenson. Washburn has likewise been run into Washington. These are but a few of the many of the slaughtered original names. In some instances the changes appear consistent, but in others unaccountable.

W. V.

**Curious Phases of Vitality.**—An esteemed correspondent furnishes us with the following list of Centenarians, with a note accompanying, from which we extract the very pertinent observations, "that it would be a very valuable contribution to vital statistics, if we had a correct list of all persons who have reached 110 years, with correct notices of their habits of living, their occupations, places of birth, climate, and general conditions affecting life. I know of no such

record, and am inclined to think there is none. For years past I have made a record of all persons of whom I could get authentic account, who have exceeded 110 years, in this country. I append this list, imperfect as it is, in the hope it will be added to until it comprises a record at least approximately correct."

NAMES.	PLACE OF DEATH.	YEAR.	AGE.
Bacchus, <sup>1</sup>	Frederick, Virginia,	1840	110
Adam Binkley,	Davidson Co., Tenn.,	1837	138
Abin Bayard,	Maury Co., Tenn.,	1833	118

Richard Cottrill,	Columbia, S. C.,	1874	119
Samuel Jones,	Rockingham Co., Va.,	1873	133
Blackhoof, <sup>1</sup>	Illinois,	1831	114
Abin Paiba,	South Carolina,	.....	143
Mathias Bayley,	South Carolina,	1789	134

This table is not only incomplete, but in all human probability defective in some particulars. In but two or three instances does it go back into the last century. If we may take the United States Census as a basis of calculation, we may infer that about 500 people reach an age of 100 and over annually, and die. Thus, in 1860, the census mentions the decease of 466 centenarians: 137 white, 39 free colored, and 290 slaves. The fact will strike the reader forcibly, as exhibited in our table and the census, that the condition of slavery was one very favorable to longevity. The slave had plain, simple, and wholesome fare, was worked moderately, yet regularly, and was free from the excitements, disappointments, and trials that attend the white race in their struggle for riches and fame. But some of the whites who reached the great age shown in our table were subjected to the extreme hardships attending border life. Captain John Lovewell was a famous Indian fighter, and was celebrated in song as the famous Indian sagamore Panguis near Fryeburg, Maine, in 1720. Many others went through all the excitements incident to the encroachment on the confines of savage life.

<sup>1</sup> Slave, or free colored

As a general thing, extreme old age lapses into senility, the faculties decaying one after another until the long-forgotten-of-death drops quietly into the grave. But in many cases some very remarkable cases of recovered faculties are recorded. Alexander Berkely recovered his sight perfectly at 110, but this lasted only thirty days, leaving him then utterly blind. His wife died soon after (January 9, 1826), at the great age of 111, the pair having lived together in wedlock about ninety years. Mike Dougherty walked two miles the day he died, ate a hearty dinner, smoked his post-prandial pipe and then quietly died at 134. The case of very aged persons recovering their sight is rare, but we may supplement the case of Berkely with that of Richard Jamison, of South Carolina, who died in 1813, aged 103, who had his sight perfectly restored several years before he died. Several instances are mentioned of aged people in England cutting new teeth, but we are aware of no such cases in our list. In two cases mentioned in our table, the aged men in one respect resembled old Parr of England—they might have lived longer had they not met with accidents; we refer to John, the Washington slave, and Thomas Prince, a free colored man of New York, who was as quick-motivated as a man in the prime of life.

It is to be regretted that our records of the last century are so meagre. Our New England ancestors were notably a hardy race, hard-working, temperate, and the fathers of many children. Lewis Barry, of Champlain, New York (*obit* 1813, *etate* 105), was the father of twenty-four children by one wife. Thomas H. Park, of Grafton, Vermont, though only 40 at the time of his death, was the father of twenty-one children. For people to gather their great-grandchildren at Thanksgiving day was no uncommon thing, but such a case as that of Mrs. Anna Slade (*about* 1813 at Bethlehem, Connecticut) is rare, she having been followed to her grave by grandchildren who were grandfathers!

One might show some very singular instances in which one age overlapped another in New England, making three individual lives cover the period between the landing of the Pilgrims in 1620 and our own age. Thus, Peregrine White, the first white child born in New England, lived into the last century; Abner Cobb, of Kingston, Massachusetts, who died in 1721 at 107, was for several years the cotemporary of White; so a person born in 1721 and living a century, might have a child living to celebrate our centennial of 1876.

I accept Professor Rask's theory for the reduction of the ages of the Patriarchs, not only because it is well sustained by authority but compatible with reason. On his theory take the first twelve patriarchs, including Methuselah, divide their ages by twelve (the ancient year being a single lunation), and the reduction at once satisfies probability and reason. When, at a later period, a season or six months become a year, the next twelve patriarchs may be subjected to a similar reduction by division of six, and the result will be equally reasonable and satisfactory. It is said Manetho reduced the immense lapse of ages in the Egyptian chronology in this way. Certain it is the Egyptian chronology puzzles with no such improbabilities as are presented in the Pentateuch.

When the reader has made a few reductions as suggested,

he will come to the conclusion, and a very correct one as I think, that people live to a greater age now than at any previous period of the world's history. And why should they not? Look out on American Indians, forever engaged in tribal warfare. Let us suppose that the same condition of affairs existed in the tribal ages of the Bible, and we shall realize that life was very precarious. It is only within two centuries that the preservation of life has become a duty of governments, that sanitary regulations have been enforced. Within this period statistics show that the *average* duration

of life has increased, and the raising of the average argues a raising of the maximum. In this country two causes conspire to make long life. In the first place there is a wide admixture of races, and consequently of fresh blood; and in the second place, the country is extensive enough to offer every nation in Europe a climate congenial with that in which their people were born. These combined with a careful enforcement of sanitary regulations must inevitably produce longevity.

STERN WHEELER.

## CURRENT MEMORANDA.

### Capital and Labor—Their Rights and Wrongs.—

Amid the tumult, clash of arms, scenes of conflagration, destruction of property, and loss of life brought about as the products of the recent strikes on the great trunk railways, so many conflicting reports and ideas fill the press, and are heard from groups of men gathered here and there, that but little rational satisfaction is gained either by reading or hearing of the great events which so rapidly succeed each other. The spirit of discontent and devastation which seemed to have reached its zenith at Pittsburg, in reality, at this writing, does not appear to have spent its full force. From what looked like a small spark at Martinsburg, on the Baltimore and Ohio Railway, has loomed up the most gigantic revolts against property and capital which America has ever witnessed. Baltimore startled the country by its reports of conflict between the strikers and the authorities; but it was left for the Iron City to wear habiliments of mourning, and witness the ashes of what but a few hours before represented millions of working capital. In the path of the great highways, Cincinnati, St. Louis, Chicago, and San Francisco have suffered as with a besom of fire and death. And now the great valleys of Wyoming and Lehigh are being prostrated by the same spirit. The coal regions, with their mines of wealth, are in the hands of the dissatisfied miners, who hugging the delusion of Communism, believe there should be an equal distribution of the wealth of the country among the masses.

As in Pittsburg, so elsewhere, have the strikers received the sympathy of a very large proportion of the people, irrespective of their occupations, or the rights and wrongs in question. This sympathy took tangible shape in Baltimore, Pittsburg, and Reading, and there the authorities were made, at least for a time, submissive to the strikers and the rabble who supported them. Not only moral aid was given in these places, but material assistance with arms and the implements of warfare. This sympathy, in very many cases of good citizens, was born of only "good-will" towards the workingman, they believing that his rights had been trampled upon, and that the destitution in so many homes was caused by the cruelties and injustice long practiced by the capitalists and monopolists of the country; and that *somehow*, and in *some way*, this strike, with their coöperation, would remove the great evil—low wages—and that "full and plenty" would

come to all. Reason is one thing, and sympathy is another. The former is rarely exercised by an idle, hungry, and excited crowd. In Egyptian darkness, unless checked, they rush on wildly to their own destruction. This encouragement has borne its legitimate fruit, and many of the sympathizers now stand appalled as they witness the wreck of their best interests and the degradation of their chosen city of habitation.

Rebellion against *just* and *constitutional* authority never won a *substantial* victory in the world's history. Two wrongs never created a right, any more than two rights could produce a wrong. These remarks bring us to the vital questions at issue. Both the common and written law as embodied in our statutes and great National Charter, as well as the practice of "equitable dealings" among mankind throughout the world, proclaim and recognize the doctrine of PRIVATE RIGHTS and PUBLIC RIGHTS. One of these Private Rights was evaded and trampled upon when the strikers took possession without permit of what was not their property, but that which was solely the property of the railroad corporation. One of these Public Rights was ignored and trespassed upon when a national highway was put in subjection by the strikers, in defiance of constituted authority—City, State, and National. A second Private Right was violated when the strikers checked the traveller on his peaceful mission, whether of pleasure or business. Says the highwaymen, "thus far and no farther, unless you pay me my price." It is the same doctrine in spirit, no matter how modified by its dress and surroundings. A Public Right was intruded upon when supplies for the public were seized by the revolvers, and the people were made to suffer in consequence.

We are willing to concede the statement that most of these overt acts were committed by those outside of the strikers' organizations; that in the main the men who were incensed at the recent reduction of wages were opposed to violence, so far as acts of arson and plunder were indulged in; but this concession does not remove from the strikers the grave responsibilities attending the revolution. Their acts were the living influences and examples which kindled the baser passions and drew into the rebellion the most vicious elements in society. Their example very naturally aroused the mob spirit, and gave the pretext to fire and plunder. The "out of money" and "out of work" class requires but little

argument to draw it into the flood of destruction. Truth is not strained when we state that "necessity knows no law," and the larger number belonging to this class, augmented the mob element to fearful proportions. "Come and let us reason together," as a command, would have but little effect after the battle was once fairly opened. No time then for calm and considerate discussion of the causes and remedies for the present distressed condition of things.

And what has all this revolt accomplished? Has it enhanced the price of labor, opened more avenues of employment, lessened the cost of living, increased respect for the employé, or in any way mitigated the existing evils? Assuredly not! But on the other hand it has irrevocably added to the burthens of the laborer's life. It has checked public confidence, which was gradually returning to its natural channels; it has alarmed property holders in the security of their property; it has weakened the faith of capitalists in making adventures in various forms of business enterprise; it has interrupted monetary and mercantile exchanges; it has, in a word, seriously impaired the general health of the numerous currents which give vitality to manufactures, trade and commerce.

The *crops* to be gathered from this insurrection are worse than Dead Sea apples. The staple articles of subsistence—flour and beef—have already advanced in price. The flow of capital towards manufacturing and mining interests is impeded, and the amount of money usually distributed to the mechanic and laborer is lessened. Where before the strike many received a half loaf, now only a quarter, or none at all. Earnings in the coal regions of Scranton and Wilkesbarre were but a week ago possible and real; now, flooded mines have, and are still cutting off all hope in those sections. The wholesome circulation of wages before the strike among grocers, butchers, clothiers, shoe dealers and other business men will now be contracted, and *harder times the sure result*. It needs no prophet or seer to tell the result. The natural laws of supply and demand inexorably make their own chiselings on life's checker-board.

Having shown the causes and logical sequence of strikes, we are asked, "Is there no remedy for this struggle between the employer and employé?" We answer, yes! but never by defying authority and acts of coercion.

The interests of capital and labor are mutual; each has its rights, its domain, and its dominion. The laborer is entitled to elect his own occupation, and decide for whom he shall work, the price of his services, and the number of hours that shall constitute a day's labor. The capitalist can lawfully claim as his right the power to elect the number and kind of employé, to designate the time they shall work, and the amount of compensation he can afford to give. No contract is valid as between employer and employed, unless it embodies mutual assent of both parties. In law there are at least five primary elements or conditions, indispensable to every contract. 1. There must be two or more parties to make a contract. 2. There must be a subject matter for a contract. 3. A consideration expressed or implied. 4. A mutual assent of both parties. 5. A time, expressed or implied, when the contract is to commence and when it is to terminate. After an acknowledgment of these conditions, either orally or in writing, conformance thereto

is made imperative by both the Common and the Written law. An application of these conditions to the question at issue in the present strike, will make it perfectly clear to the dulllest mind. If due notice was given by the railroad companies to their employé that on and after a certain date, a reduction of wages would be made, and the employé not consenting thereto, one condition at once is not met, mutual assent, and the employé and employer are no longer bound. This must be understood on the idea that the former contract became extinct by termination of the period for which it was made. To illustrate. If A be engaged by the year at a certain stipulated annual salary, the contract will continue in full force for the year, and he be entitled to that specified rate, whatever it may be, until the close of the year. No reduction can be made without the consent of A prior to the end of that period. If A be discharged, he is entitled to damages for the unexpired term. The same principle applies if A should be employed by the *month*, the *week* or the *day*. The right to discharge as well as the right to employ is guaranteed by all our laws upon the subject. An equal *right to work or not to work* is reserved to the owner of the capital embodied in his services.

The mutual interest existing between capital and labor demand that there should be complete harmony and confidence, for the injury of the one is detrimental to the welfare of the other. The capital held by the mechanic, artisan, and labor population in this country is as real, though composed of talent, education and experience in the various callings, as if it were coined into metal, with this difference, that one is available at all places, and at all times, while the other—labor—is to some extent a creature of circumstances. Labor is ideal, until made real by production. It is ideal, in the sense that it is incorporeal, until made corporeal by its creative power. It is a misnomer to speak of the strike as a war between capital and labor. It would be just as consistent to say between capital and capital. This fact is recognized by the General Government and the several States in their encouragement to emigration—regarding as they do each emigrant or new settler as so much capital added to the State. Political economists name specifically this value from \$1,000 upwards or downwards, according to certain supplies or demands for labor, or the producing power.

Looking at capital and labor from all possible standpoints, war between them is little less than suicide. The well-being of both are promoted by mutual concessions, the injury of both by harboring distrust and jealousy. The golden rule, "Do unto others as you would that others should do unto you," if put into practice more frequently would prevent most of the contention among men.

The remedy, if any can be obtained, for the improvement of the condition of the working classes, is only by pacific measures. Laws compelling a greater degree of justice on the part of corporations, monopolies and others of the employing power, faithfully enforced, no doubt would give some relief, but after all no permanent succor will come until private and public confidence is restored. This restoration is our only basis for hope and the future. Supply and demand, production and consumption, will go on as of old, regulating the rates of wages, and the prices of the ornaments and the necessities of life. (Continued in next issue.)

**The Russo-Turkish War.**—Since we last met the readers of the MONTHLY, nothing of a startling character has transpired abroad. The substance of the reports which reach the United States rather show in the aggregate success to the Turkish arms. The movements of the Russian forces are kept so quiet that we can little more than conjecture their plans and possibilities. Russian official news only comes when the movement is completed. Despatches from the Turkish side, regarding events in Europe, have been either wholly false or so exaggerated as to be practically worthless. Whether there has been any serious fighting south of the Balkans is still uncertain. What is certain is that a force has crossed, which seems to have been thus far able to hold its own against the Turks. The objective point is probably the Shipka Pass, which, if the Russians gain, will give them a safe route over the Balkans as they now have across the Danube. The capture of Nikopolis secures the vital point of safety for Russian communications and places the Danube under their control from Nikopolis to Sistova. They have two bridges at Sinnitza and are about to place another between Turnu Magurelli and Nikopolis. Military critics are much divided as to whether they will attempt to mask the quadrilateral and push a large force into the plain of Adrianople or first sweep the Turks from Bulgaria. The latter theory finds the most supporters, but those who believe in the intervention of England and Austria hold the opinion that political reasons will compel Russia to push on to Adrianople or even Constantinople, despite military risks, in order to compel the Turks to yield quickly. An absence of despatches or any information from Rustchuk for some days would indicate that the fortress is closely invested. The Turkish headquarters is still at Schumla. The Russian Dobrukscha corps is moving steadily in the direction of Silistria and Varna, and thus far without opposition. In Asia Minor the situation remains unchanged. The main forces confront each other east of Kars. Both sides are reported to be hurrying forward reinforcements for a decisive struggle. Dervish Pasha has not been able to effect anything against General Oklobjia's command since the latter yielded its positions before Batoum. General Komaroff holds Ardahan, with four thousand men and ninety guns. He is said to be provisioned for nine months. General Turgukassoff after rescuing the garrison of Bayazid again retired behind the Russian frontier, but seems able to keep the Turkish right wing at bay. The latter finds great difficulty in bringing up provisions and ammunition. Thus the armies of the centre, which comprise the main force of each combatant, cannot expect a diversion from either flank and must depend on the strength of their own battalions in the conflict, which it is believed the Russians will not postpone long. The announcement that the Russians had crossed the Balkans created a panic throughout Roumelia and in Constantinople and led to the resignation of Safvet Pasha, the dismissal of Redif Pasha and Abdul Kerim. Other ministerial changes are said to impend. Whether these changes indicate weakness or a desperate determination on the part of the Porte is not yet apparent. The Russian progress has also created some political excitement in England. Those who advocate intervention in an anti-Russian sense were urgent for an immediate declaration of the ministerial policy. Lord Derby's speech in favor of a

continued neutral course has caused much discontent among this class, but generally is very well received.

There has been no occasion for an official declaration from Austria since the Balkans were crossed, but the best informed writers in Vienna for the foreign press declare there will be no change in Austria's attitude on that account. Intentions to send an army corps to Gallipoli whenever Constantinople is seriously threatened have been sometimes attributed to the British government, both by its supporters and opponents.

**The Treasure of Islam.**—Mr Delaplaine, the charge-d'affaires of the United States at Vienna, furnishes to the Department of State the following interesting information concerning a certain remarkable war resource of Turkey, the so-called "Treasure of Islam." The Sheik ul Islam has recently sent a delegation of doctors of the law to the Cherif of Mecca, a direct descendant of the Prophet, for the purpose of demanding funds to be applied to the defence of the Islam faith. It is customary on these solemn occasions for the Cherif to assemble the college of the elders, charged with the guard of the Prophet's tomb, which will decide upon the appropriate sum to be furnished to the Sultan from the Treasure of Islam, in order to aid him in the war against Russia. This treasure is formed from those annual offerings of the pilgrims which are accumulated in the Kasbah of Mecca. These sepulchres, which serve as offertory chests, are placed within the court of the mosque. Each pilgrim daily casts into one of these a coin as offering, which constitutes the alms prescribed by the Koran as one of the essential elements of the merit of the pilgrimage which every Mussulman should make at least once in his lifetime to the tomb of the Prophet. Accordingly every year about one hundred thousand pilgrims come to Mecca who sojourn there a month, consequently a sum of at least 3,000,000 of francs are annually received in these offertory chests. Every pilgrim deposits, in fact, an offering, varying in amount according to his means, but which, on the average, may be estimated as equivalent to five francs at least for every day considering that there are rich Mussulmans whose offerings attain even the amount of 100,000 francs during their pilgrimage. The result is that the Cherif of Mecca receives, on the average, the value of 15,000,000 of francs in annual offerings. One of the offertory chests was opened during the period of the Russo-Turkish war in 1828. Several large sums were withdrawn, but it was afterwards closed. A second chest was opened in 1854, during the Crimean War, but the third has not been opened since 1415, during a period of now 462 years. Inasmuch as the annual concourse of pilgrims has rarely fallen below one hundred thousand, it is conjectured that, with most liberal allowances, the accumulation of money in the last-named offertory chest cannot be less than 250,000,000, and it is fully believed that the total amount of the Treasure of Islam may exceed 600,000,000 francs, and even attain a much higher sum.

**The Convention of Cotton Dealers.**—Those who are interested in the great staple products of the United States will not pass over lightly the action of influential representatives assembled recently at Liverpool.

Nine American delegates, and representatives from Havre,

Amsterdam, Hamburg, other Continental markets, and influential representatives of the Liverpool trade were present at the sitting of the Cotton Convention in Liverpool. Mr. W. B. Forwood was elected President and Mr. R. Holt Vice-President. The President welcomed the delegates to the most important gathering ever held in convention with the trade. He referred to the altered condition of the cotton industry in consequence of the abolition of slavery and the establishment of cable communication with the United States. Mr. Simpson, of New Orleans, the President of the American delegation, read a paper on "The shipment of cotton from New Orleans," claiming that the utmost care was taken to secure shipment in good condition. Mr. Campbell, of New York, read a paper on "The Cotton Trade of New York," and claimed that his exchange had taken steps in regard to business in "futures," whereby losses to those outside from fluctuations were almost nil. Mr. Proskauer, of Mobile, Mr. Bright, of Galveston, and Mr. Muir of Savannah, read reports as to the conduct of the trade at their respective ports. The following resolutions were then passed:

That in consequence of the serious losses to the merchants of this country by damage to cotton, particularly from Mobile and Galveston, a more efficient inspection before shipment should be provided, and no cotton should be shipped beyond the port of Mobile, or outside the bar at Galveston, except from covered lighters; that when exceptional allowances for damp are being made at the scales, no cotton shall be shipped until authorized by the inspectors; that it is desirable that cotton should be bought and sold in America at net weight.

A resolution that all bales on which an allowance for damp has been made should be specially marked was rejected.

**Philologists and their Doings.**—To keep our readers fully informed of new ideas which are brought to the front, we record that at the session of the American Philological Association in Baltimore recently, papers were read on "Vocabularies of Children Under Two Years of Age," "Cockneyisms," "Virgil's Use of the Collective Noun," "Different forms of Assimilation," and other subjects. Professor F. A. March, of Lafayette College, Easton, Pennsylvania, Chairman of the Committee on Reform in English Spelling, presented a report. The report says: The attempt to prepare an English alphabet according to the principles that an ideal alphabet would seek to adopt for its characteristics forms which would suggest the sounds signified, brings out the following facts: There are eighteen Roman letters which commonly represent in English nearly the same elementary sounds which they represented in Latin. It seems best to follow the Latin, and other languages written in Roman letters, in the use of a single sign for a short vowel and its long form, distinguishing them when great exactness is required by a diacritical mark. The alphabet would then have thirty-two letters. It seems necessary, therefore, that there should be a transition period, and for this the following suggestions are made:

1. Transition characters may be used resembling, if possible, the Latin letters A (in fate), E (in meté), I (in fine), U (pure)

2. The diagrams now representing single consonants may be named and otherwise treated as single letters.

3. New letters can be introduced by using them only for the old which they resemble in form.

4. Long words will bear changes best, and vowels are more easily changed than consonants, which project more above and below the line. Dropping silent E is the easiest change.

The committee was continued, with instructions to communicate with associations of this character in England.

The following officers were elected for the ensuing year: President, Professor B. L. Gildersleeve, Johns Hopkins University; Vice-Presidents, Professor John S. Sewall, Bangor Theological Seminary, and Professor Crawford H. Toy, Greenville, South Carolina; Secretary and Curator, Professor Samuel Hart, Trinity College; Treasurer, Charles J. Buckingham, Poughkeepsie, New York; Executive Committee, Professors F. D. Allen, University of Cincinnati; W. W. Goodwin, Harvard College; F. A. March, Lafayette College, Easton, Pennsylvania; J. H. Trumbull, Hartford, Connecticut, and W. D. Whitney, Yale College. The next annual meeting takes place at Saratoga, New York, July 9, 1878.

Much credit is due to the leading spirits engaged in this reform; it can at best only be expected that the people will be gradually educated up to the necessity of the change, which in itself must be of slow growth.

**The Rush Library of Philadelphia.**—Among the many attractive buildings in the Quaker City, the new one erected by the executors of the late Dr. James Rush, on the block bounded by Broad, Thirteenth, Christian and Carpenter streets, for the use of the Ridgway branch of the Philadelphia Library, commands considerable public notice. It will be ready to open this month. It is improbable, however, that the question of accepting or declining the gift will be brought before a meeting of the stockholders of the library for a year to come. Although the property is worth about \$800,000, numerous objections are urged against accepting it. The Library Company is awaiting a legal decision as to whether the legacy shall be taxed or not. The taxes on the Rush property would amount to about \$15,000 a year—more than the company would be willing or able to pay. Several of the members offer as another objection that the new building is too far from the business centre of the city. Should the stockholders not accept the Rush Library, which contains a nucleus of about six thousand volumes, it will be conducted by the executors of the Rush estate. Several months must elapse before the tax question can be decided.

**Observations for our Government.**—Brevet Major-General William B. Hazen, commander of the Sixth Infantry, has been selected for the position of military attaché to the American Legation at Vienna for the purpose of observing the military operations between the Turks and the Russians. General Hazen is now stationed at Fort Buford, Dakota Territory, but will soon come East preparatory to sailing for Europe. General Hazen is thoroughly competent to discharge the responsible duties abroad, and our Government is slow to recognize the great value of war instruction from Turko-Russian sources.

## LITERATURE AND ART.

**Mental and Physical Vigor in Literature.**—The thought presented to our mind at this writing is of a twofold nature. Mental vigor in literature is so intimately associated with physical robustness, that in considering the one we involuntarily are led to look at the other. We do not desire, however, to convey the idea that intellectual power in the field of letters is inevitably a concomitant of physical strength and hardihood. It is our aim rather to show that health in literature flows more naturally from men and women whose whole nature, mental and physical, are blooming, so to speak, with the healthy currents of life. A sound body should certainly give more tone and spirit to the faculties of the mind than one under some of the many diseases to which the human system is subject. The relation between mind and matter is so close and the machinery so delicate, that very slight causes produce at times appalling results. In the natural order of things, we are compelled to admit that health of body in the literary profession is more easily spoken of than realized by its membership. The requirements are of such a character that a sedentary life is, in the main, an indispensable thing. True, walks and drives on land, and rowing and sailing, if you happen to be near water, may infuse more spirit to the blood and set the pulsations going more rapidly, but after all these must perforce come irregularly, and be in a measure forced. Back in the professional grooves—the house and chair—the author goes, as they represent the *home* of his literary labors. Health, though so essential to workers in this vineyard, we are obliged to confess, is most difficult of attainment. An exchange, in speaking on the subject, says:

"If one desires a literary life he desires a good thing, provided he can do its work. He should, however, heed the advice of an English medical writer. 'The first things,' he says, 'to which one entering the profession of literature must make up his mind, are to be respectable and healthy.'

Many men of genius have left behind them but fragments instead of completed work, because they would not live respectable lives. Burns ruined his usefulness by drink and idleness. Cowper, on the other hand, was so afflicted with a natural gloom as to be often tempted to suicide. His life

was, to quote his last words, 'unutterable misery.' Yet his writings exhibit but a faint trace of this melancholy tendency. Daily exercise, temperate meals, and a punctual observance of regular hours of study and rest, preserved his reason, and enabled him to do much good work.

Thompson, the author of 'The Seasons,' says the writer

already quoted, 'faded away from lazy and self-indulgent habits.' Dr. Samuel Johnson was scrofulous, hypochondriacal, corpulent, and averse to bodily exertion. He was passionately fond of eating and drinking, yet he restrained himself, walked a good deal, and worked steadily and patiently. Later in life he abstained entirely from wine, because he thought it injured his health. He rested his mind with sportive conversation, and even when his body broke down, the retention of his mental faculties rewarded him for the care he had taken to preserve his health.

Robert Southey, who made literature a healthy and successful profession, lived a very rational life amid the fresh air and quiet of a country home. He associated with congenial and loving spirits, took regular exercise, maintained a frugal table, worked industriously, and lived temperately and chastely. His mental powers abode with him in old age, and his memory is blessed.

The more delicate the machinery of the body of a literary man, the easier it is disarranged. The more sensitive his mind, the more readily may it be clouded. Therefore, if he would continue useful, he must take care of his body.

Muscular vigor gives boldness to the thoughts, as mental culture gives wisdom, or moral training imparts purity to the expression. A very large preponderance of the great re-

formers of the world possessed robust constitutions, and many of them were giants in muscular power. The power to endure shocks and buffetings, and the courage to face all opposing forces, and the strength to hurl the enemy of right from his usurped throne, are combinations of force which have ever distinguished great reformers. Martin Luther, an engraving of whose statue appears in this connection, could never have brought about the great Reformation had he not possessed such a grand physique—broad shoulders, full chest, and herculean strength marked every limb. It was no easy task to

STATUE OF MARTIN LUTHER, THE REFORMER.

batter down the walls of error and superstition in their own strongholds. This physical manhood became mighty when backed by culture and the kings of moral power. We see the Reformer boldly proclaiming the doctrines of the Reformation to those in power, and wielding an influence morally grand. There are noteworthy exceptions to this, but we believe history will bear us out in the main idea, that physical and mental power should both be imposing if they would achieve signal victories.

**Art-Study not the Prime Wisdom.**—Mr. Gladstone, in a speech at the School of Art, Greenwich, happily defined the place of physical science and æsthetic culture in relation to the higher duties of life. "Whatever I may think of the pursuits of industry and science, and of the triumphs and glories of art, I do not mention any one of these things as the great specific for alleviating the sorrows of human life and meeting the evils which deface the world. I believe in their reality, their efficacy, and their value; but I believe they are efficacious and valuable for the purposes for which they were ordained, and not for purposes for which they were not ordained. If I am asked what is the remedy for the deeper sorrows of the human heart—what a man should chiefly look to in his progress through life with which to sustain him under trials and confront his affliction—I must point to something very different, to something which in a well-known hymn is called 'the old, old story.' It is this 'old, old story,' told in a good book, with the teaching to be found there, which is the greatest and best gift ever given to mankind, a gift carrying with it and imposing upon all alike the most solemn trusts and responsibility, arousing the fullest recollections of the past and the brightest hopes of the future. If we were at this time to consider the main purpose for which we live, that is the topic on which we should have to dilate. But I am free to own that even those who have been most zealous for religion, and perhaps in consequence of their zeal for religion, have sometimes pushed that zeal to such a point that they have lapsed into not only the unnecessary, but I think the disturbing and injurious view of human nature in the dispen-

sation under which we live—that, provided men are well instructed in the principles of the holy faith they profess, nothing else is worth attention in this life. I believe that is not perhaps a fatal, but certainly a serious and dangerous error, because it disassociates religion from the general course of thought and of life, from the necessities of man's condition, and from the opportunities offered to him by the faculties he possesses for self-improvement. The human nature in which we are cast was not endowed and equipped with all its marvellous faculties for nothing. The glory of the Creator in the external and inanimate world is not to be seen in some one object only here and there, but in every object; and the glory of the Creator in man,

who is the crown of His creation, although it may be more clearly shown in certain faculties and capabilities of his nature than in others, yet is to be seen in them all; and it is the due, equable, proportionate, and effective development of that nature in all its capabilities which constitutes the true and full idea of the duty of man in the world in which he is sent to live. I venture upon this observation for myself lest, in speaking of the immense value which is to be attached to the subjects with which we are dealing just now, it should be supposed I was setting them up as having some exclusive claim of allegiance upon you."

**Art Talent and its Rewards.**—In the August number of the MONTHLY we devoted considerable space to the subject of REPRESENTATION as applied to art and

LUTHER PROCLAIMING THE REFORMATION.

nature, and endeavored to analyse and measure the character and potency of taste and judgment in reference to art creations. The standards of excellence are so diverse that the artist's conceptions are frequently misinterpreted or at least misunderstood. It was our aim to show that the shafts of unfavorable and unjust criticism are too often hurled at the artist's production or the author's work. Locke, very truthfully says, "If ideas and words were distinctly weighed, and duly considered, they would afford us another sort of critique than what we have been hitherto acquainted with." The ability to criticise justly is more rare than is generally conceded. We find few who strictly are connoisseurs of art or literature. Incentives to achieve greater triumph in the higher depart-

ments of culture, however, are not only honor as a meed well earned, but a fair pecuniary reward for the talent and labor bestowed upon any given work. Youthful talent is frequently awakened from habits of supineness and even idolence by words of encouragement, and we would sincerely deprecate any course that would tend to smother the sparks of genius. Many of the æsthetic influences in the world grow out of the productions of youth. Such talent should be fostered. There is force in the remark of Watts: "When an author has many beauties consistent with virtue, piety and truth, let not little critics exalt themselves and shower down their ill nature." Both art and literature require for their healthy growth the services of the professional critic, and, at times, vigorous and severe judgment conduces to improve and elevate them as distinctive objects of human employment.

As a field demanding the best native and cultivated talent, should it not yield to the toiler a harvest in some degree commensurate to the value of the forces employed? This is a question easily answered in the affirmative; but if we ask, Does it yield satisfy or compensate equitably the artist or the author? we are forced to answer in the negative. Quite a large number of worthy workers are not only not able to accumulate money or property as a consideration of faithful industry in their respective occupations, but *unable* to meet the necessary current expenses of living. The annual exhibitions at the Academies of Design in New York, Philadelphia and other cities, tell, we are sorry to say, of unremunerative artist labor. The sales recently at auction, under the most favorable circumstances, of pictures at the New York Academy of Design, speak as inexorable acts. The exhibition was certainly one of the best known in its history. The public interest was fully alive to the great attractions, and patrons, in point of number, were all that could be desired. But of the six hundred and seventy pictures on view, nearly two-thirds of which number were for sale, only a few were purchased—sixty all told, very nearly all of these at a marked discount from the catalogue price. The disappointment to the artists, who depended upon the results of the sale for some remuneration, can be more easily imagined than described. Artists cannot live on fame alone; it may be food to the mind, but little consolation to the body. The need for bread is poorly met with the praises of critics and the admiration of the multitude. There are many causes for this lamentable state of things. One is the general distribution of cheap chromos and inferior paintings among the masses, at mere nominal prices. Imitations of the real are made substitutes, and while they do not fully cater to the tastes, they, for the time being, satiate, and thus detract from the tangible recognition of the artist and his work. The depressed condition of business at large, has aided in securing such results. In this connection, *Leslie's Weekly* says:

"There have been other influences at work which have prevented purchasers from availing themselves of the peculiar advantages offered them at the Academy, and which will check sales by the artists from their studios. These have arisen from the growing tendency of artists to resort to the auction-rooms as a means of disposing of their works. The result of this has been a natural expectation on the part of that portion of the public who are picture-buyers that there would be rare bargains after the close of the exhibition, and

that it was, therefore, poor policy to buy until the highest bidder should have a chance to take the prize. Indeed, so confident were the auctioneers of this arrangement, that one of them actually hired a hall in anticipation of his share of the spoils in the shape of commissions, and picture-buyers were advised by these gentlemen to await the certain result. And, within a few days of the close of the exhibition, a number of the principal artists found it necessary to publish a card disavowing any intention of selling their pictures by auction.

"Now, no more ruinous policy could well be devised for the artists than the system which some have adopted of painting a number of pictures to be sold under the hammer to the highest bidder. The effect is inevitably to beget a feverish and unsatisfactory feeling on the part of the artist who adopts this method of disposing of his works. He is continually looking forward to the chances of the auction, as the stock-speculator looks forward to the results of his ventures. Pictures by other than famous artists are of very uncertain value in an auction-room. They are not like sheetings or sugar, or boots and shoes, that bring within a fraction of their market price. The visitor to the painter's studio, who sees a picture that pleases him, hesitates to buy it at a fair price, if he knows that similar canvases are soon to be sold by order of the artist himself, at perhaps any sacrifice, and the tendency of the whole system is to throw the picture business into the hands of the auctioneers.

"It may be said that there is no other way by which a young and unknown artist can bring his pictures before the public; and that he must realize upon his work, for he must live. But the auction-room is not the place in which to build up a reputation as an artist, and whatever may be done in individual cases, under peculiar circumstances, to keep the wolf from the door, it is the regular dependence upon auction sales as an outlet for the artists' work that is so injurious to their interests. It would be well if some plan could be devised to bring the work of our artists more thoroughly and continuously to the notice of picture-buyers. The Academy Exhibition is of short duration, and it does not seem practicable to make it longer. One of the London water-color societies has adopted the plan of a continuous exhibition of pictures for sale, and it has proved quite successful. In London and Paris, the number of dealers upon whom the artist can depend as customers, even at moderate prices, is large compared with those in our principal cities. Any plan which will bring the buyer in direct contact with the artist is desirable, and the employment of a competent and trustworthy agent, who is familiar with the works of the different artists, is perhaps the best method for all concerned.

"The auction-room, of course, has its legitimate office. When private collections of pictures are obliged to be sold at the best price, they must come under the hammer. Then there are the worthless daubs, such as are hawked about the streets, from door to door, and sold at the best offer made. These naturally find their way to the auction-room, and, under strong gaslight, and with the aid of the glib tongue of the auctioneer who descants upon their merits, are bought by ignorant persons at what seem to them great bargains. But the pictures which are bought under the hammer ought to be confined to those which must be sold at any rate. The true

artist should shrink from adopting so objectionable a method of realizing from his work, and should look upon the auction-room as but one remove from the pawnbroker's. It would be well for art if the public held the same opinion."

The few artists who produce work simply for the love they have for the business, and not as a means of livelihood, can afford to wait till fair consideration is given for their talent and service. The great majority, however, of those who belong to the fraternity, must make their labor the means of subsistence. It is this fact which takes away many of the charms connected with the artist's profession, and in no small degree retards the advance of art.

**A Brief History of Montenegro and Bulgaria.** By GEORGE M. TOWLE. Boston: James R. Osgood & Co.

The Eastern question, in several of its bearings, is very graphically and clearly presented in this little book of some ninety pages of fine-toned paper, bound in tan-colored cloth, with neat imprint of title in black letter. Following the table of contents, we find a clear 12x16 inch MAP of Montenegro and Bulgaria. Until we read this little volume, we had but faint conceptions of the powers of the Montenegro inhabitants. We had admired their hospitality to the stranger, but did not give them credit for such eminent warlike qualities. The whole story is so well told that it seems more like a romance than a history true to life. The author in his introduction says: "The fullness of the admiration which the civilized world lavishes upon a people resolute to maintain and defend their independence, belongs to that little, obscure, out-of-the-way niche of Southeastern Europe which the Venetians set the example of calling 'Montenegro,' and its own inhabitants call 'Tsernagora.'" Within the past two years, we have seen this rugged and dauntless race once more asserting itself against overwhelming odds, holding a nation of fifteen millions at bay below its savage mountains, and, with its little army of twenty thousand, keeping in check the by no means despicable legions of the Osmanlis. Serbia, its bigger neighbor, was quickly and easily subdued, and readily made peace, though Russian volunteers filled their ranks, and Russian officers led the onset. Montenegro held out stalwartly against the Turks; like many a Vladika before him, the young prince Nikita stood with his petty army, at the entrance of his craggy passes, invincible."

**The French Humorists, from the Twelfth to the Nineteenth Century.** By WALTER BESANT, M.D. Boston: Roberts Brothers, Publishers.

The title of this 12mo, cloth bound book of 450 pages, too fully explains its character to require an extended notice. It may, however, interest the reading public to learn that the author's style is rather pleasing, while clear and effective. In the opening chapter he says: "The most elementary form of a joke is the discomfiture of an enemy; discomfiture, at first, meaning death. But there are other kinds of rivalries besides those which involve mortal combat. In these, discomfiture means defeat. Advancing farther, we arrive at our modern point of laughing chiefly at those little incidents in social life which mean temporary uneasiness, awkwardness, slight mental trouble. Perhaps as civilization gets on, mankind will learn so much sympathy as not even to laugh

at these. Laughter, however, is in its nature the expression of relief from anxiety, of surprise, or self-congratulation. It is in any form a sort of triumphant crow of victory, and as such will go on, let us hope, forever. Satire, on the other hand, of which humor is a branch, is the weapon of the weak. It is an acknowledgment of helplessness. In times of oppression, it is the boldest and most outspoken; it languishes when law becomes strong and men grow mild; it is lethargic in times of freedom." As we get more into the book, we find our interest increases, and that it is replete with anecdotes and incidents really entertaining. In speaking in one place of Reutebeuf, the Charlatan, the author tells us that "he dressed in the conventional robe which proclaimed his calling in the triple capacity of singer, quack and traveller." At another, we read that Reutebeuf, "in one of those heavy moods which sometimes fall upon all bards, had the bad taste to write about his own wife, even to complain of her age and ugliness." To exhibit this mood, we give the stanzas:

" Home and money I had none;  
Yet I married. Was it done  
Out of pure good-will—  
All to cheer and comfort those  
Who hate my luck and love my woes,  
And would wish me ill?

" Such a wife, too, I must choose;  
Poor and ragged as her spouse;  
Pale and thin of face.  
Neither fair nor young was she,  
Fifty years her age might be,  
Tall and scant of grace."

In his preface to this volume, the author states: "I have selected those whom I consider representative writers, many of them hitherto almost unknown to the English reader, though not to the student of French literature, out of every century from the twelfth downwards." The information that this well-printed volume furnishes enables the reader to see many of the brighter features and better elements in French life.

**Relating to Byron.**—We give the following, which will no doubt be of interest to those who hold in sacred keeping all that relates to the religious views of Lord Byron. It is taken from the papers left by a lady, Mrs. John Shepherd, at the time of her death, the letter having been addressed to her by the poet, in response to a very pointed epistle written to him. Byron says: "I am obliged to you for your good wishes, and more obliged by the extract from the papers of the beloved object whose qualities you have so well described in a few words. I can assure you, that all the fame which ever cheated humanity into higher notions of its own importance, would never weigh on my mind against the pure and pious interest which a virtuous woman may be pleased to take in my welfare. In this point of view, I would not exchange the prayer of the deceased in my behalf, for the united glory of Homer, Cæsar, and Napoleon, could such be accumulated upon a living head. Do me the justice to suppose, that 'video meliora proboque,' however the 'deteriora sequor,' may have been applied to my conduct."

## SCIENCE AND MECHANICS.

**Science in its Relation to Nerve Power.**—That great system which has its capital and depot of supplies chiefly in the brain, generally known as the NERVE SYSTEM, has received of late years the attention of the greatest minds in the scientific world. The subject has not been confined, as of yore, to men who make chemistry and physics their principal study; it has gone out into broader and more diversified realms of thought. Philosophers, as well as students and teachers of some one or more single science, have dedicated to it their best powers. Theories have been demonstrated by actual experiment and practice, and these have not been confined to one sex and one temperament. The nerves—that wonderful complex human machinery, in life, in sleep, and in death—have enlisted in their behalf the combined wisdom of two continents. Electricity, in its many forms, has been brought to aid in the investigation, and animals as well as men have been the subjects operated upon. The investigation still goes on, and thus far much real substantial progress has been made. It is a subject that concerns all, and hence anything really valuable relating to nerve power will no doubt be appreciated by the general reader. The *Philadelphia Post* says: "Nervousness is one of the prices we have for civilization; the nervous savage is a being unheard of. For this disorder, which is partly of mental and partly of bodily nature, relief is sought in various ways, and among these we may place the employment of narcotics. The temporary relief afforded by these drugs is very apt to lead those who suffer from nervous sensations to put too much trust in and resort too frequently to them. In the long run, they prove most destructive to health. Their use has of late become so frequent as to threaten society with a serious evil. It has been boldly contended that chloral is to be found in the work-boxes and baskets of nearly every lady in the west end of the metropolis, to calm her nerves. No doubt this is an exaggeration, but it is a fact that New York chloral punch had become an institution scarcely a year after the introduction of chloral in medical practice, and now it turns out that Germany—'sober, orderly, paternally-ruled Germany'—has such a thing as morphine disease spreading among its population. The symptoms are not unlike those of opium eating. Experience suggests that persons suffering from the disease should at once be deprived of the drug. Their wilfulness and liability to relapse, however, are so great that it is said that only about twenty-five per cent. have been seen to recover in a large series of cases.

"There is a close connection between a healthy brain and a quiet, unirritated auditory nerve. It is not impossible that the noise in which we live, and which fools delight in as signs of cosmopolitan life, is responsible for much of the paralysis, neuralgia and general nervous irritability, characteristics of modern times. It is no laughable matter, but a serious one, and useless noises ought to be abated as nuisances. Let it be remembered that of all our five senses, two only are intellectual, the instruments of art culture, seeing and hear-

ing. If anything, hearing is the most highly and purely intellectual, for articulate speech, reason and rhythmic poetry and music depend upon this function. The sensitiveness of an organ is in proportion to its delicacy, and exquisite torture can be caused by the ear. The eye we can protect, for we can close it at will, but the ear is an ever open portal, and throws us upon the mercy of mankind.

"It is not without a shade of melancholy that we notice in almost every daily journal the record of a faltering in the ranks of business men. This successful merchant or manufacturer has impaired his health by over-work, which means too much nervous excitement, and he starts for Europe in the hope of building up his health on a broken foundation. Another professional man is aroused from his dream of ambition with the frightful conviction that phthisis has fastened its deadly grasp upon his vitals, and the grim images of weakness and decay henceforward fill his vision. There has been an alarming increase of disease within a few years, having its origin in the causes we have named, and the effect of it should be to produce greater moderation. What if the profits are less? They can be continued longer and life made happier. There is no necessity for this waste of life—it is a sheer delusion, the effect of a foolish ambition. Better accept the heritage of poverty or a moderate success than the infallible necessity of an early disease.

"The best possible thing for a man to do when he feels too weak to carry anything through, is to go to bed and sleep as long as he can. This is the only recuperation of brain power, the only actual recuperation of brain force, because during sleep the brain is in a state of rest, in a condition to receive and appropriate particles of nutriment from the blood, which take the place of those which have been consumed by previous labor, since the very act of thinking burns up solid particles, as every turn of the wheel or screw of the steamer is the result of consumption by fire of the fuel in the furnace. The supply of consumed brain substance can only be had from the nutritive particles in the blood, which were obtained from the food eaten previously, and the brain is so constructed that it can best receive and appropriate to itself those nutritive particles during a state of rest, of quiet and stillness of sleep. Mere stimulants supply nothing in themselves; they goad the brain and force it to a greater consumption of its substance until it is so exhausted that there is not power enough left to receive a supply.

"In what does nerve food consist? In what do we find it? Is it meat? no; white bread? no; potatoes? no. If it is not found in these staples, in what is it to be found? I answer, in the exterior of the great kernel, in the skin of the potato and in milk; partially also in eggs and fish. I answer, the chief food staples, in the dietetic system are almost entirely deficient in brain and nerve building material. In view of these facts, is it a result to be wondered at that the starving nervous tissue in the overworked masses attempts to satisfy an intolerable sense of craving, of physical hunger, by the use of stimulating poisons that temporarily supply the

place of brain and nerve food? I answer, the cause of intemperance is based upon a fundamental error in the present dietetic system. Let it always be borne in mind that stimulating brain poisons—alcohol, opium and tobacco—temporarily supply the place of brain and nerve food. What is the remedy for intemperance? I answer, nerve food—building material to supply the waste of the nervous tissue in the masses. I answer, further, a reform in the present popular system of dietetics by reducing the proportion of fat and muscle forming elements, and increasing the nerve and brain-building material in a proper ratio. Let the supply in each case meet the demand and no more."

**Portable Electric Light.**—An ingenious little electric-light apparatus (says the *Mining Journal*) has been invented by Mr. Facio, of Paris, and is applicable to watches, walking-sticks, and such like. The watch, for instance, to which it is applied, is united by a chain to a link-bar, which may be placed in a button-hole, another chain communicates with a pile which may be carried in the waistcoat pocket; to the link-bar another chain is attached in communication with a receptacle or box containing wick, and a "Geissler" tube, which will transmit the spark produced by the electricity. Thus the time can be easily seen in the dark. The apparatus is composed of other conducting chains coming from the pile, and of a receiver which may be perfectly independent, the receiver being provided with a wick or bobbin, and the receiver may be made like a locket or other article, if desired; communication between pile and locket or other article may be produced by means of a button or other suitable appliance placed in any convenient position. The chains may be formed or composed of two wires and surrounded by insulating material, which latter may be covered with some precious metal or other material, as fancy or taste may dictate. The lighting material may be carried by the watch itself, or the light-generating apparatus may be provided with a case to hold the watch, or other object to be lighted up, in such manner that the glass which covers the aforesaid case will receive the action of the lighting tube containing the "Geissler" tube, and the case itself will be independent of the object to be lighted.

**Felling Trees by Electricity.**—A few years ago, a Dr. Robinson, of New York City, took out a patent through the agency of the *Scientific American*, for felling trees by means of a platinum wire, in place of the axe or saw, using an electric battery for the severing power, by keeping the wire at a white heat and drawing it back and forth, and keeping it taut to the tree as it penetrated the trunk. According to the *Lumberman*, an experiment with the same invention has recently been tried in the East Indies, from which our contemporary quotes from a local paper, published in that country. The paper states that the patentees of the process are Mr. H. H. S. Parkinson and Mr. W. H. Martin, both of Bombay; and the experiment was superintended by Dr. Lyons. The plan is simple. Two ends of the copper wires of a galvanic battery are connected with platinum wire, which of course instantly becomes red hot, and while in that state it is gently sawed across the trunk of the tree to be felled. When arrangements were made for the experiment,

it was never for a moment doubted that the enterprising merchants of Bombay were possessed of all its made thicknesses of platinum wire, but it turned out that the thickness of the thickest that could be got was only that of crochet cotton. It was at once seen that a wire of such thinness would be consumed before the tree was half severed from its trunk. However, the attempt was made. The burning wire performed its task very well so long as it lasted, but, as anticipated, the wire continually broke, and at length there was none left. There can be little doubt that with a stronger battery—the one used was only a twelve-chambered one—and a thicker wire, the experiment would have been entirely successful. As it was, the tree was sawed one-fifth through. It is calculated that, under proper conditions, a tree, which at present takes two hours to fell, will come to the ground by this process in fifteen minutes. It is almost needless to add that there is no waste of wood and no sawdust.

**A New Mineral Element.**—The scientist Hermann has announced, in the German *Journal of Chemistry*, the discovery of a new metal in material found at Hadidam, Ct. It is obtained from tantalite, of which it forms a little over six per cent., the rest being metallic acids of tantalum, niobium, and ilmenium. Hermann calls it neptunium. He has so small a quantity of the material at his disposal, that he has been unable to reduce the oxide to a metallic state. With soda it colors microcosmic salt golden yellow. It is the first element discovered for many years by mineral analysis, although in the past seventeen years, five metals—cesium, rubidium, thallium, indium, and gallium—have been discovered by spectrum analysis. The atomic weight of niobium is 118.2, giving neptunic acid the formula  $Np_4 O_7$ .

**Wonders of Modern Science.**—The perfect accuracy with which scientists are enabled to deduce the most minute particulars in their several departments, appears almost miraculous if we view it in the light of the early ages. Take for example the electro-magnetic telegraph, the greatest invention of the age. Is it not a marvelous degree of accuracy which enables an operator to exactly locate a fracture in a submarine cable nearly three thousand miles long? Our venerable "clerk of the weather" has become so thoroughly familiar with those most wayward elements of nature that he can accurately predict their movements. He can sit in Washington and foretell what the weather will be to-morrow in Florida or New York, as well as if several hundred miles did not intervene between him and the place named. And so in all departments of modern science, what is required is the knowledge of certain signs. From these the scientists deduce accurate conclusion regardless of distance. A few fossils sent to the expert geologist enable him to accurately determine the rock-formation from which they were taken. He can describe it to you as perfectly as if a cliff of it were lying on his table. So also the chemists can determine the constitution of the sun as accurately as if that luminary were not ninety-five million miles from his laboratory. The sun sends certain signs over the "inhabited space," and the chemist classifies them by passing them through the spectroscope.

## GOSSIP AND NOTE BOOK.

**Wayside Thoughts.**—How many of the readers of the MONTHLY, in the light of the past, have from the eminence furnished by experience, gazed afar off into the future, with a view of solving some one or more of the problems of human life? Human Destiny, what is it? and how is it reached? is one of those undemonstrated things of the future. Human felicity, what is it, and how best gained? is another mystery not fully solved. Labor and unceasing vigilance are the lowest prices at which man, in this world, can obtain happiness and safety. The primeval curse, "In the sweat of thy face shalt thou eat bread," includes within its scope not only the bodily, but the mental and moral powers of man. And reason and philosophy not less than revelation, clearly demonstrate that all nature, both within us and without, is so formed and constituted as to enforce this destiny.

Not only does this uncultivated earth bring forth thorns and thistles rather than fruit, but its tempting fruits, unless discriminated, may poison us. And the air we breathe, the fire that warms us, and the innumerable other objects which are essential to our existence or enjoyment, must be for the most part laboriously sought, and must all be cautiously distinguished, and appropriated, and used, if we would secure the benefits and escape the mischiefs which in some form, each has the power to occasion.

And if we seek for happiness in the exercise of the mental and moral powers, the same toil and danger await us. The temple of science stands at the summit of an almost inaccessible mountain. "Truth lies at the bottom of a well." Moral rectitude is a critical medium, the two extremes of which are vices. And even the path to heaven, as we are instructed from the sacred desk, is narrow and difficult, with a broad road leading from it to perdition; so that earth and heaven are legibly inscribed by the finger of the Creator with the sublunary doom of man—*toil and watchfulness*.

And yet, such is the intrinsic constitution of human nature, that this apparently severe destiny is the efficient cause of its highest dignity and happiness. Perils and impediments in our path prompt us to vigilant and energetic action. Our chief happiness consists in successful effort—in acquiring the desirable objects around us, not in their supine enjoyment—in eluding or grappling with and overcoming danger, not in a quiet, lifeless exemption from it.

**Dey Vants ebery dings in von Rose.**—A German selling flowers found the ladies desired to have in a rose more than commonly is found in these beautiful plants. A little annoyed at their demands, he finally said: "I have so much drouble mit de ladies ven dey come to buy mine roses. Dey vants him doubles, dey vants him fragrand, dey vants him nice golour, dey vant ebery dings in von rose. I hope I am not vat you calls von uncillant man, but I have somedimes to say to dat ladies, 'Madame, I never often see de ladies dat vas beautiful, dat vas rich, dat vas good-temper, dat vas youngs, dat vas clever, dat vas perfection, in one ladies. I see her much not!'"

**A Small Flower Garden.**—A writer in the *Western Farm Journal* recommends for a small flower garden the following list, as they do not require treatment, are good sturdy varieties, will stand neglect, yet do well: Asters, balsams, dianthus, petunias, phlox, calliopsis, verbenas, sweet peas, mignonette, cinneas, marigolds, and portulacas. The same writer again says: "The plants I have named will afford a profusion of flowers from June to October. Phlox will be the first to blossom, and then petunias will come on, and both of these flowers continue to increase in beauty until hard frosts come. Asters will be in perfection in August and September. Calliopsis begins to blossom in July, and nearly all the others come on early in that month. If old flowers are removed and not allowed to go to seed, you will have a much greater profusion of bloom. If you do not remove faded flowers, but allow them to perfect seed, you will soon see that your plants are losing a large share of their former glory. You can't expect a plant to ripen seed and blossom profusely at the same time."

**Double Casement.**—When John Kemble lived in Great Russell street, Bloomsbury (the house was taken down when the western wing of the British Museum was built), he had one of his windows made double, so as to keep out the noise. Upon this James Smith wrote:

"Rheumatic pains make Kemble halt,  
Nay, fretting in amazement,  
To counteract the dire assault,  
Erects a double casement.  
Ah! who from fell disease can run?  
With added ills he's troubled;  
For when the glazier's task is done,  
He finds his panes are doubled."

**Parlor Ornamentation.**—What can be more appropriate than the now prevailing fashion of ornamenting the interior of private residences with artificial flowers? Parlors, reception rooms, boudoirs and dining-rooms are made brilliant with bright garlands of flowers. Parian marble and decorated China vases upon the mantel shelves contain bouquets in imitation of the rarest blossoms of the conservatory. On the window niches and the four corners of the room handsome *jardinieres* are placed upon rosewood and black walnut stands. These are filled with sawdust and covered with dried moss, and from this "soil" pyramids, crowns, anchors, crosses and wreaths of flowers are built up in the most graceful manner. Proud jessamines, graceful lilies, ethereal blue bells, pert daisies, bright buttercups, royal heliotropes, meek violets and the sweet little arbutus, mingle in lovely confusion with the rose leaves and trailing wild vines, falling gracefully over the *jardinieres*, and sweeping the carpet with their emerald leaves. These are expensive luxuries, but nevertheless whatever makes our homes attractive should be adhered to at the sacrifice of extravagant clothing.

**A Beautiful Passage.**—The following is from the "Reveries of a Bachelor," by Ik Marvel: "A poor man without some sort of religion is at best but a poor reprobate, the football of destiny, with no tie linking him with infinity and the wondrous eternity which is even worse—a flame without heart, a rainbow without color, a flower without perfume. A man may, in some sort, tie his hope and honor to this shifting ground, to his business or the world; but a woman without that anchor called faith is a drift and a wreck. A man may have some moral responsibility out of relation to mankind, but a woman in her comparatively isolated sphere, where affection and not purpose is the controlling motive, can find no basis in any other system of right action but that of faith. A man may craze his thoughts to truthfulness in such poor harborage as fame and reputation may stretch before him, but a woman—where can she put her hopes in storms, if not in Heaven, and the sweet truthfulness, that abiding love, that enduring hope, mellowing every page and scene in life, lighting them with radiance when the world's storms break like an army with cannon? Who has enjoyed the love of a Christian mother but will echo the thought with energy and hallow it with tears?"

**Mr. Hook and his Friends.**—Theodore Hook was delighting a few friends one summer's evening at Fulham by an extempore comic song, when, in the middle of it, the servant entered with. "Please, sir, here's Mr. Winter, the tax-gatherer; he says he has called for taxes." Hook would not be interrupted, but went on at the pianoforte as if nothing had happened, with the following stanza:

"Here comes Mr. Winter, collector of taxes,  
I'd advise you to pay him whatever he axes;  
Excuses won't do, he stands no sort of flummery,  
Though Winter his name is, his process is *summery*."

**A Happy Thought.**—God knows what keys in the human soul to touch in order to draw out its sweeter and most perfect harmonies. They may be the strains of sadness and sorrow; they may be the loftier notes of joy and gladness. God knows where the melodies of nature are, and what discipline will call them forth. Some with plaintive tongue must walk among the lowly of life's weary way; others in loftier paths, and hymn of nothing but joy as they tread the mountain tops of life, but they all unite without discord or jar as the ascending anthem of loving and believing hearts finds its way into the chorus of the redeemed in heaven.

**How to get It.**—"Now, John, suppose there's a load of hay on one side of the river and a donkey on the other; how can the donkey get to the hay without getting wet?" "I give it up." "Well, that is just what the other donkey did," said John's friend.

**Getting Along.**—A farmer the other day wrote to a New York merchant, asking how the farmer's son was getting along and where he slept at night. The merchant replied "He sleeps in the store in the day-time. I don't know where he sleeps at night."

**Mr. Ruskin Practices what he Preaches.**—He says that his father left him \$600,000, besides a great deal of real estate and many valuable pictures. His mother also left him \$185,000. He gave \$85,000 to his poor relations, sold the pictures, bought Brantwood, assisted a young relation in business at a cost of \$75,000, spent another \$75,000 on harness and stables, and has given \$70,000 to St. George's Company, besides having spent \$350,000 variously. He is at present worth \$270,000, and announces that he intends to give his valuable Marylebone property to St. George's Company, his Herne Hill estate to his cousin, and the \$60,000 which will remain to him he will invest, and live and die upon its interest.

**Learned when a Child.**—Carlyle says: "The older I grow—and I now stand upon the brink of eternity—the more comes back to me the sentence in the Catechism which I learned when a child, and the fuller and deeper its meaning becomes: "What is the great end of man?" "To glorify God and to enjoy Him forever."

**What did Simon Say?**—A Sunday-school teacher in Albion asked her class the question, "What did Simon say?" "Thumbs up!" lisped one young lady.

**Khivan Proverbs.**—He who steadies himself between two ships will certainly be drowned.

Shame is worse than death.

He who weeps from his heart will provoke tears even from the blind.

A lean horse and a hero in a strange country each look amiss.

When you go to law against the Emperor, God himself should be the judge.

**One Step.**—To what length may the widow go when she desires a new parent for her children? She may go one step farther.

**Going to Sleep on his Watch.**—"Papa," said a little boy to his parent, "are sailors very small men?" "No, my dear; what leads you to suppose that they are so small?" answered the father. "Because I read the other day of a sailor going to sleep on his watch," replied the young idea, smartly.

A boy in Iowa recently found a pocket-book with a large sum of money in it and returned it to the owner, who gave him a five cent piece. The boy looked at the coin an instant and then, handing it reluctantly back, sighed and said, "I am very sorry, but I can't change it."

**The Pull-back an Objection.**—"I shouldn't like to be an oarsman," said Jones. "Why not?" asked Green. "Because an oarsman has so many pull backs," replied Jones; and then the two youths shook hands, and went out to buy something.

**The Best Resorts.**—The best summer resort for ladies—Rockaway. The best for boys—Long Branch. The most bracing—Milk-punch.

## CIVIC AND SCENIC NEW ENGLAND.

By ORAMEL S. SENTER.

### IV. SPRINGFIELD AS IT WAS AND IS.

THE Valley of the Connecticut River is noted not only for its charming scenery, but for the great number of its beautiful towns. These dot and adorn this stream of flowing crystal like pearls threaded with a cord of silver. And then, there are hundreds of villages and hamlets that are gems of their kind; and most attractive and pleasing of all are the numberless finely cultivated farms, in the centre of which, or at some feasible, and it may be sightly point, stands the stately mansion adorned with grand old shade trees of elm, sycamore and maple; or instead of this noble relic of other days, may be seen the cozy cottage, exquisitely neat in style, ornamented with shrubbery and flowers without, and fitted up by the hand of cultured taste within, till it is a paragon of comfort and refined enjoyment. From Saybrook to Connecticut Lake, there is not a mile, except perhaps at one point, that does not abound in fertile farms and pleasant sites for dwellings; and every turn in the fair river presents some landscape of mild and charming loveliness, or some grand scene of picturesque and sublime beauty.

The people of this favored spot are moral, temperate, industrious and frugal; and, as might be expected, poverty and crime are alike almost unknown among them. Intelligent, stable, and characterized by a manly independence, they

VOL. IX.—16

THE NEW COURT-HOUSE.

move on in the quiet, even tenor of their ways, seeking chiefly their own happiness and that of their families; but when called to act for the community or the public, they do its business as faithfully as they would their own. Not ignorant of public affairs, nor unmindful of their country's welfare, they yet give little heed to administrations and policies, except in their bearing upon the general

good; for whoever is President and whatever party triumphs, makes but slight difference to them personally, for the heavens will still be propitious, and at the right time open their windows and let gently down the copious shower, and distill upon their crops day by day the gentle and fertilizing dew; and the earth, which is their grand bank of deposit and discount, that never breaks unless rent by an earthquake—least likely of all places here—in due time is sure to yield an abundant increase. Year by year the grass springs upon their hillsides, the rich luxuriant grain waves in the valleys, and in

the fullness of the season the golden harvest is gathered home. Field and fold yield generously, fruits of various kinds bless the sight, and when the grand festal day of New England (Thanksgiving) comes, both the villager and the husbandman, the mechanic and the tiller of the soil, may sit down to tables groaning with the good things of earth, and each head of his happy household may say, with reverent voice and grateful heart: "We thank Thee, Divine Giver, that whatever others in Thy providential dealings may lack, Thou hast withheld from us, and from this favored land, no good thing!"

This Valley is not only productive and beautiful, but is blessed with an abundance—almost profu-

sion—of schools, churches, libraries and other institutions calculated to refine and elevate the people. In one of its most attractive portions, lying under the shadow of Mount Holyoke, within a territory of some ten miles in extent, there are two Colleges of the highest order—Amherst and Smith's at Northampton—one for young men, the other for young women; one of the three Insane

Asylums of Massachusetts, a school for deaf mutes, on an improved system, with the finest buildings and best facilities, both of the latter being at Northampton; Mount Holyoke Female Seminary, founded by Mary Lyon, and one of the oldest and most favorably known in the country, and something like a dozen first-class academies, including the fine classic school, "Williston Academy," at East Hampton, founded by the millionaire whose name it worthily bears. In what other part of the country, among the rural districts, shall we find the equal of this? And yet in the

THE FIRST BAPTIST CHURCH.

Connecticut Valley, scores of places can be found almost as highly favored, and hundreds more, where, if they have not so many literary institutions, they have an abundance of the good things of life with every needed privilege. This, then, if not the ideal land of which philosophers have dreamed and poets sung, realized, where peace and plenty reign and the primal virtues, temperance, industry, integrity and justice, pure and impartial, flourish—it is the nearest approach to it that we have ever known.

But, dropping all figure of speech or flights of imagination, there is no doubt that, staid and undemonstrative as the people of this fair and favored spot are, the influence of their intelligence and

moral worth is felt throughout the land, and from this peaceful Valley healthful streams flow forth to bless and beautify the whole earth.

Among the many delightful towns of this fairest portion of New England, if not of the Union, we might name Middletown, Wethersfield and Hartford, in Connecticut; Springfield, Northampton, Greenfield and Deerfield, in Massachusetts; Brattleboro, Windsor and Newbury, in Vt.; and St. Johnsbury, Vermont, which is on a principal affluent of the Connecticut River and on the western slope of the same Valley, might properly be included.

But the most attractive of them all, and one of the most beautiful places in the country, is Springfield, Massachusetts. We know not which most to admire, its almost unequalled location, its broad and well-shaded streets, its fine public and private edifices, the variety and value of its industrial and trading enterprises, or

SPRINGFIELD, FROM LONG HILL, LOOKING NORTH.

that happy combination of all that is desirable in its social and business interests. It has long been the shire town of Hampden County, which was formerly under the name of Hampshire, having been divided into three counties, Hampden, Hampshire and Franklin. It is one of the oldest towns in the State, having been settled in 1635, the first in Western Massachusetts, and the first in the Valley north of Windsor, Connecticut. In the early Indian wars it was once or twice sacked and burned. In fact this whole Valley, now so peaceful and prosperous, with none to disturb its inhabitants or make them

very emblem of peace, plenty and undisturbed repose. If such is the effect of recalling the impression which the narrative of these things made on the mind in early life, what must have been the reality to those who witnessed and especially those who endured them? And what must have been the untold suffering of those who lived in constant fear of sudden massacre, and worse still, of captivity, torture, and finally the most cruel death; thus dying daily, as it were, in imagination and the fear and dread of impending danger? As we gaze at those fertile and charming fields waving with luxuriant grain and laden with the

fruitage of the seasons; as we behold the flocks grazing undisturbed upon the hillsides and the peaceful farmhouse close by, affording shelter and security to its inmates, where the smoke once ascended over the remains of its slaughtered occupants; and as we pass by those mighty waterfalls which man has harnessed to his machinery, and listen to the click of the shuttles or the hum of countless spindles; and behold in these emblems

HAYNES HOTEL.

afraid, was the scene of many a shocking massacre by the bloodthirsty savages and their almost equally savage allies, the French of Canada. Religious bigotry and hatred did not lessen the fiery zeal and cruelty of these early allies of the Indian tribes of the North—the Algonquin and St. Francis nations. Deerfield, Hadley, Northfield and many other towns were partially or wholly destroyed, and some of them were repeatedly made desolate by the ruthless foe.

We seldom pass the stream and the ledge where Captain Lothrop and the eighty young men, the flower of Essex County, were slaughtered, without thinking of their hapless and untimely fate; and we never hear the names of these places that were the scenes of the numerous Indian atrocities, without a thrill of horror at the thought of the cruelties that were once perpetrated here, staining with the blood of men and of innocent women and children these fair fields that are now the

and instruments of peaceful industry, thrift, prosperity and happiness—the change seems hardly less than miraculous. It is only by considering these things that we can realize what the plenty, the comforts, the peaceful, happy homes we possess, and the glorious institutions we inherit, cost our forefathers of Colonial and Revolutionary times.

One of the strange evolutions of time and the revelations of historic eras, a thing that speaks not so much of poetic justice as of the wonderful changes that take place—is the fact that throughout New England, the descendants of those marauders, the French of Canada, who joined the Indians in excursions to rob, burn and destroy the English settlements, are now domiciled undisturbed in many of the very towns that their forefathers helped lay waste. Such are the overturnings of time and the lessons of history! These Canadian French flocked into New England

during the late war, at the period of high prices and scarcity of labor, and having gained a firm foothold, will not soon be dislodged.

At a very early date, almost cotemporary with the Revolution, Springfield was made the location of a United States armory, and down to our own day it has been the principal place for the manufacture of arms by the Government. This brought money into the place and gave it a sort of national

neighbors, and its inhabitants were a stable, intelligent and eminently self-satisfied people. They thought Springfield as near perfection as it could well be. Why should they not? Was not its location one of the finest in the land? Had it not the county business, and numerous learned and eminent professional men among its citizens? Had it not trade and more or less of commerce? Was it not the largest and most important town

FREE CITY LIBRARY.

fame and prestige. It was also surrounded by a fine farming country, which naturally poured its riches into the lap of Springfield. She had artisans and merchants and professional men, and her local trade and influence were considerable. Lumber and the lumber trade came to her from up the river, and groceries and mercantile traffic from below; for boats were accustomed to worry through to this place, though navigation was never good above Hartford.

With these moderate advantages, and some others that might be named, it was a slow, but solid, and for that day, a prosperous Connecticut river town. Relatively it stood high among its

in the great Valley north of Hartford? But the pride of Springfield was its aristocracy—its noted men and ancient families, and fine gentlemen, all of the olden time. There were the Pynchons, the Dwights, the Edwardes, the Chapins, the Blissess, the Burts, the Warriners, and others that might be named, and some of them were even millionaires. Had not Springfield reason to be proud and self-satisfied? She was. Her people were wealthy, aristocratic and contented. Nor indeed did they care for rapid growth or more business. Why should they wish to cumber and deface their beautiful town with manufactories and fill their streets with greasy operatives and

dirty mechanics? No, not at all. It would degrade the place and destroy forever its select society.

But Springfield "saw another sight," and witnessed the dawn of a new era, when railroads made their advent. When the Boston and Albany Railroad was built through here, in 1838, she had business forced upon her, as some men have greatness thrust upon them, willing or unwilling. From that time we date her growth in population and wealth, and with it the decline of her local aristocracy—honorable and admirable of its kind—and that staidness, in which she was a representative town of the Valley, took its departure never to return.

Even after the advent of railroads, for some years her growth was not equal to that of many of the neighboring and interior towns, like New Haven, Hartford, Worcester, etc., for her rich men still invested their capital abroad, and the people waited for others to come and build railroads and manufactories for them.

Now, all this is to a great extent changed, and Springfield is noted for the amount and variety of its manufactures, its extensive trade, its fine public and private edifices, and for the enterprise and wealth of its business men. One of its citizens, worth ten or fifteen millions, and a prominent public man, commenced life a stage-driver; though we are sorry that he did not have it so stated in the Congressional Directory, or that the writer of the biographical sketch should have the bad taste to conceal this fact, so creditable to the gentleman referred to, and so aptly and beautifully illustrating the happy working of our free institutions.

Few places excel this in the number and value of its manufactures. We give a list of these, the most full and accurate that could be obtained, though we are aware that it is far from being complete. Among others are the following: One of railroad cars; two for sporting arms; one for revolvers; one for steam engines, boilers, etc.; two for gold chains; one of gold leaf; one of gold rings; three of cutlery; two of card-boards and glazed paper; one of blankets; one of cartridges; two of desks and counters; three of elevators; one of corrugated iron; one of filters; several of furniture; three of hand stamps; four of hardware; one of gas generating machines; one of gilt moulding; several of harness, saddlery and trunks; one of levels; two of mattresses; one of sewing-

machine needles; one of paint; three of paper boxes; one of collar paper; three of paper collars; two of rubber goods; one of sieves; two of show-cases; one of skates; two of slippers; one of spectacles and thimbles; two of steam pumps; one of matches; one of woollen goods; five of bricks; one of boots and shoes; two cotton mills; two brass foundries; one of fancy stationery and writing paper; five book publishing establishments; one of games, and games and toys for children; one of rules, dividers, etc. There are a number of heavy paper manufacturers living and storing their goods here, whose manufactories are at Agawam, Chester and other places outside of Springfield. We have given this list of its manufactures because their number is so great and they embrace such an interesting variety, and no general description would convey the idea with the force of a specific statement. It will thus be seen, that, imperfect as the catalogue is, it numbers nearly fifty kinds of goods and products, some of which are of rare and novel kinds. Over five thousand men are employed in the different manufactories, giving this city substantial prosperity, even in these exceptionally hard times, that is in marked contrast with most other places. Among the most extensive of these, is the establishment of Wesson & Co., manufacturers of pistols, employing from six hundred to one thousand hands; and that of Wasson & Co., car manufacturers, who have a still larger number of workmen, and whose fame in this line is of world-wide notoriety.

Go where we will, we see their make of cars; and a Springfield man may travel around the globe, so to speak, and still ride very possibly in cars that were made in his own city, with a proud consciousness that increases his self-respect and gives him a higher regard for the place of his residence.

We should like to speak particularly of the more interesting or curious manufactures of this place, but can mention only one; we refer to that, or rather *those* of Milton Bradly & Company, in whose inventions and productions we became much interested on our recent trip to Springfield. In visiting our summer resorts and observing the different games, and especially when inspecting some of the many ingenious and even intellectual amusements for children in our shops, we have often wondered who could get up all these, and provide so abun-

dantly for the entertainment and instruction of "the little folks." To Mr. Bradly they and their fortunate fathers and mothers are largely indebted for the invention and improvement of their games. Mr. Bradly uses the most improved machinery, and employs at times as many as a hundred hands in this interesting and important business; for, as some one has well observed, "Give me the writing of a nation's songs and I will control her politics;" so most emphatically may it be said, "Give one the making of the children's games and the control of their amusements, and he will determine

mention that Mr. Bradly has taken the lead in introducing and improving the methods of "Kindergarten," having gotten up and published several editions of a standard work upon this subject, and manufactured the apparatus and materials which this system or mode of instruction calls for.

We remember well when it was maintained that Springfield could not successfully rival other large and wealthy towns, already controlling the patronage of the country, in the very lines of goods which she now either leads in, or bravely comes up for her full share of patronage. All this shows

HAMPDEN HOUSE.

the character of the rising generation." To a great extent at least this is true, and a most interesting and responsible work it is! But Mr. Bradly, of a courteous and genial spirit and inventive turn of mind, and an enthusiast in his calling, is just the man for the business, and the articles which he gets up supply the land with the best class of games and ingenious devices to amuse and instruct and make happy "the dear children." A draftsman and engraver, etc., by profession, Mr. Bradly is the "factotum" man, and life and soul of his establishment. Practical as well as inventive, he has been as successful in securing the prosperity of his own business as in exciting the interest and promoting the happiness of thousands and tens of thousands of his little protégés. We ought to

that the trite old proverb, "A faint heart never wins a fair lady" might be slightly modified, to read with equal force, "A faithless man never wins a fortune, unless he steals it; and the man who lacks enterprise will fail to gain the best prizes in the business world."

Among the various arts and trades, such as engraving, electrotyping, lithographing, dentistry, and many others that might be named, her artisans claim to do as good work as can be obtained in the country, and the engravings of this article are not bad evidence of this in their line.

We wish we had the data at hand to give the amount in dollars of the yearly products of her various and prolific industries. They would, unquestionably, count up many millions.

Among the various manufactures of Springfield, it may interest the reader to know that the postal cards, now so popular and extensively used, are manufactured here—or were, and we suppose are still—by Messrs. Morgan & Co.; while the Government bank-note paper is made at Glen Mills, in Delaware County, Pennsylvania.

In one respect this city ranks low, and yet high. Her public debt, all told, amounts to only about one million of dollars, a mere trifle in a city of her wealth and resources. Happy would it be for other cities had they acted upon as honorable principles and wise forethought!

Perhaps we ought not to have mentioned this interesting and very uncommon fact, lest there should be an immense hegira of the victims of reckless waste, misrule, and robbery from other cities to this financial Mecca.

As a still further evidence of the wealth and prosperity of the place and the saving habits of the people, we will cite one item. In the different "Savings" institutions the amount several years ago was eight million five hundred thousand dollars, now probably fully nine million dollars, while the other banks have about three millions of capital.

The valuation—which in New England is put at about two-thirds the worth of the property—is given at thirty-eight million three hundred and thirty-six thousand seven hundred and seventy-eight dollars.

Springfield has been somewhat noted as the home of prominent public and literary men. Of the latter, none is probably so well known and widely esteemed as Dr. J. G. Holland, author of "Timothy Titcomb," "Gold Foil," "Bitter-Sweet," and various other works, and who at the present time is the popular editor of *Scribner's Monthly*, and also *St. Nicholas*, a magazine for the "Little Folks."

In the newspaper line, Springfield is favorably known. The *Springfield Republican* has attained a wide circulation, and a national reputation unusual for a journal outside of the large cities. Its popularity and success have been due in large measure to the pen of Dr. Holland, who was for many years connected with its editorial staff, although Mr. Samuel W. Bowles, the senior editor and proprietor, wields a terse and vigorous pen. He has also figured to some extent as an author.

By the way, we are often reminded of the fact

that many persons are in doubt when they see J. G. Holland's name with a "Dr." appended to it, whether it means "M.D." or "D.D." Well, we can assure them that Dr. Holland was in early life a real doctor of medicine, not one who hurls at people divine anathemas. For a short time he dealt out real pills, bitter of course, but probably sugar-coated; or, though bitter to the taste, sweet in their healing effects, either of which facts might have suggested the title to his work christened with the paradoxical name of "Bittersweet." It is said the Doctor did not like the business of dispensing medicine, so he took to dealing out doses of literature to the people, which they received gladly and swallowed with nods of approval. In return, they have given him fortune and fame.

Professor Parsons, late of Cambridge Law School, once wittily remarked, respecting William Cullen Bryant, who left the law in disgust to become an editor, that "The profession lost a very *poor* lawyer, and the public gained a very *good* editor and poet." This applies to Dr. Holland only in part; for it is said by persons from the field of his short professional experience, that he would have made a skillful physician had he continued in the practice. But this honorable and useful profession did not accord with his tastes, nor with the aspirations of that genius which has placed him in the front rank of the popular writers of America.

We have referred to the *Springfield Republican* and its remarkable success in the journalistic field. First it was a weekly and then a daily paper, or rather both weekly and daily, and succeeded in each stage of its growth; though as a daily its early progress was slow, and its success for some time was looked upon by the public as doubtful. When established on a firm basis, people believed that it could succeed, because it had succeeded; but it was thought that another daily could not possibly exist and prosper in Springfield. Several attempts were made to establish one, but were only partially successful, till the *Daily Union* was started. Mr. Bowles of the *Republican* had become too much of a "reformer" to suit the conservative men of the great Republican party, when the patronage of such, and that of many others, was transferred to the "new paper," which issued a weekly as well as a daily edition, and gradually attained a firm foothold and

a vigorous growth. It was started in 1864, but did not come under the able management of the present publisher, Mr. Clark W. Bryan, till 1872. than that several churches can be sustained. Especially they do not doubt the permanent prosperity of the *Daily Union*. Messrs. Bryan &

INSTITUTION FOR SAVINGS.

Mr. Bryan is a graduate from the business department of *The Republican*, and we presume that that institution lost one of the "main spokes of the wheel" when he stepped over to the other office. The *Union* is a large, well edited and prosperous paper, and no one doubts now that two dailies can succeed in Springfield, any more

Co. also carry on a somewhat extensive business in book-binding and publishing.

One specimen of their work we noticed in a very full and finely gotten up directory of Springfield, which we thought alike creditable to the city that will sustain so large and expensive a work of this kind, and to the firm who got it up. Their place

of business, which is a large brick structure, looking very much as represented in the engraving, is ever the scene of great activity, mental and physical, of brain work and hand-craft, and is the very type of solid prosperity and well-earned success.

Springfield has several book publishing firms of extensive business and national reputation. Among these, none is more widely or favorably known than that of the brothers G. & C. Merriam. They are known not only to men of bookcraft, in the making and selling, but every scholar and almost every child throughout the land is as familiar with the name of the publishers of Webster's Dictionaries as with household words. Those acquainted with the business locations of Springfield, will recall their old place of business at the corner of State and Main streets, now bearing other names on the sign and reading strangely to those who were conversant with this city twenty years ago. There are many pleasant memories connected with this corner bookstore, and one very singular incident, which occurred at the period referred to. We think it worth relating, as illustrating animal psychology if nothing more.

A horse became frightened near "Armory Hill," and ran furiously down State street, clearing himself from the carriage, and making in his course a wide path among the frightened occupants of the street. The animal was in such a complete frenzy of fear as to be apparently blind to every object and obstacle, and on reaching Main street, instead of turning up or down this broad thoroughfare, it struck madly across the way, at a slight angle, dashed into the bookstore of the Merriams, through the show-case window, and passing out the back side, struck against the rear of another building, with solid brick walls, and fell down dead. As the horse came pell-mell through the store, crashing glass and scattering books, the sight was so strange and unaccountable that the frightened clerks and customers disappeared up stairs or wherever they could betake themselves, as suddenly as if a meteor or an exploded steam-engine had shot through the establishment. No wonder they rushed from the counters and ceased for the moment to dispense books and stationery, for this unexpected visitor had opened to their wondering eyes the most *striking passage* which they had ever seen among the literature of the day. But the most remarkable fact remains to be told. The

concussion of the horse against the wall was such as not only to crush his breast, but the force of the blow was so great as to break in two a solid sandstone window sill. This fact suggests that possibly the horse, in running down a steep hill (as State street then was) almost with the speed of the wind, had got under such momentum that he could not turn on reaching Main street, but only veer, as he did, at a partial angle. And yet it is reasonable to suppose that he would have made a more successful attempt had he not been blind with fright. We will offset this incident with Murray's story of "A Mad Horse," though this is true, while the apochryphal historian of the Adirondacks now acknowledges that his famous narrative was a fiction.

One of the old landmarks noticeable and pleasant to former residents or visitors at Springfield, is the First Congregational Church. It is a plain wood structure, but has a fine location on Hampden Square, around which cluster the City Hall, Court-house, and other prominent public buildings. Yet we presume that in a few years it will have to yield to the ravages of time or the behests of fashionable religion, and give place to some more costly and imposing structure. Its former pastor, Rev. Samuel Osgood, D.D., who preached here his fiftieth anniversary sermon, and some time thereafter, was a man of tall, large figure, and strong mind, blunt, sincere, and somewhat eccentric. At one time he had acquired a great penchant for attending auctions—not to buy goods, but to watch the proceedings. Perhaps he thought it a good school in which to study character and draw therefrom material for his sermons; or, as a favorable place to unbend and relieve his mind after the strain and tension of preaching and pastoral labors; but most likely, it was one of those foibles, if not decided faults, to which clergymen as well as others are liable. This practice became the subject of remark, and an offence to some of the weaker or stronger brethren, and their pastor was told of his failing. He promised to reform in the matter complained of, kept his word faithfully, and henceforth the tall form of the venerable preacher was no more seen to cast a shadow across the threshold of the auction room. At another time he was reminded that his sermons were too long for modern tastes, and especially to hold the young and draw strangers. He thanked the brother kindly for the suggestion, and hence-

forth his discourses were remarkably short for a man of his years.

Another incident illustrates both his eccentricity and his bluntness. A gentleman came to church

HIGH SCHOOL.

one Sabbath, tormented with a pair of squeaking boots, which, by the way, we think, rather worse than a crying baby. The unfortunate victim of this trap set for his unwary feet by some wicked son of Crispin, had his pew in the gallery, and at the farther end; or for some reason had started to take his seat there. To add to his embarrassment, the services had commenced, and the venerable preacher was reading the first hymn. As the man moved slowly and painfully along the aisle, the sweat, we presume, oozing through every pore, and agony wringing his soul, while the tell-tale boots announced every step of his progress with the soul-torturing and ominous "squeak!" "squeak!" when he had got about half way to his destination, the blunt and sorely tried preacher could stand it no longer, but stopping short in the midst of his hymn, and pointing his finger to the man, he called out, in a loud and authoritative tone of voice (all who ever heard the doctor will remember how strong the heavy bass tones of that voice were), "Sit down, sir! Sit down!" The unfortunate man settled down into the seat nearest at hand, looking as though he would sink through the floor, or wished heartily that it might open and swallow him up. We presume he did not go straightway out and drown himself, or burn the offending boots, but we have no doubt he was led to meditate upon the bluntness of the parson and the trials that sometimes attend church-going.

As we have already more than intimated,

Springfield has many elegant private residences and an unusual number of public edifices of more than ordinary architectural merits. Among the latter we might name the City Hall, of brick; the Court-house, of granite; the public or free Library, and the High School buildings, both of brick, beautifully ornamented with light sandstone; and several of the churches of sandstone (called here "free stone"), or of this material combined with brick—that are of large dimensions, fine proportions and a high order of architectural structure and finish. Notably among these is the church of Rev. Mr. Buckingham's people (Congregational) on Maple street; the Second Baptist and the Unitarian, on State street; the Episcopal on Chestnut street, and several others of much merit in architectural design and material, which we cannot now recall by street and name. The first and last have admirable locations, having elevated sites on two of the finest streets of the city. Outside of the churches, the Court-house and High School buildings have the most architectural merit; although the Third National Bank,

MASONIC HALL.

especially its front, situated on Main street, and of iron, is considered by the citizens of Springfield as the most imposing specimen of architecture in the place. It very strikingly resembles the Stewart

Home for sewing girls, at Thirty-fourth street and Fourth avenue, New York City. The picture of the High School building does not do it justice. Pictures generally either flatter or depreciate the objects they are supposed to represent.

We have alluded to the exceptionally fine situation of Springfield. A word of explanation respecting the special topography of its site, may serve to make its attractions in this respect more apparent. The Connecticut River spreads out to a great width opposite to the city and below it, having narrowed above, at Hadly Falls, and again contracting its limits at Windsor Locks below. Along by the city, its direction is southeast, but near the south end, it sweeps gradually and gracefully—grandly we may say—towards the west, making the great curve which is seen to good advantage in the picture giving a birds-eye view of Springfield. The apex of the curve to this magnificent sweep of water is on the east or left side and towards the city. On both sides, the river is bordered by fine meadows and table lands, rising on the side of the city by steps or terraces to a crowning summit of table land, on the most beautiful and commanding point of which the United States Armory is situated. This affords the finest sites for the streets and houses, which, being made to conform with the natural shape of the ground, rise one above another in an attractive and sightly order, giving the fortunate dwellers here delightful views of their city and the surrounding country. The prospect from the Armory, or rather Arsenal building, is one of surpassing loveliness. Not many of our older towns are built upon plans thus wisely formed from hints given by Nature.

Springfield is most favorably located for communication by railways with all parts of the country, not so much from their number, as from their peculiar and favorable location; or rather, its position in reference to these. It is midway between Boston and Albany; nearly midway, on the best route, to the White Mountains, Canada East, etc.; and the favorite route to Boston and other portions of New England, both summer and winter, especially the latter, is by way of "The Valley City." But the company that gave Springfield the first start, and imparted to her the new life, and most of all helped to make her what she is to-day, was the Boston and Albany Railroad, for many years called the Western Railroad, so

named from the grand object which it had in view, namely, opening up communication between Massachusetts and the Great West.

In our references to the Springfield of the past, we briefly alluded to its local trade, which was considerable even in those early days. This has in fact been a leading feature of its business in every period of its history.

But while the retail trade of her merchants has been large, it was not until recently that they had, or really expected much *wholesale* business. But by judicious and persevering efforts, her more enterprising dealers have within the last few years built up a large trade with Western Massachusetts, Connecticut, and Southern Vermont, in the wholesale line, thus wisely emulating the enterprise of the manufacturers, and spurring them on to new efforts in their lines, if they would not have their laurels eclipsed in the race for success. In thus competing successfully with the traders of New York and Boston, they deserve great credit, as well as the profits which we trust they have reaped. Once, such an effort would have been thought preposterous, and to broach the idea would have brought ridicule upon its authors. But why should they not succeed in this bold style of enterprise in thus presuming to compete with the large cities, as well as the newspapers and manufacturers of their city?

In the matter of hotels, this place has a reputation of many years standing—long antecedent, in fact, to the advent of railroads. The United States Hotel, afterwards rebuilt and called Warriner's Union House, was known throughout the continent, being noted for its home comforts and fine cookery, especially the latter, in the good old days when it was done by the first-class American housewives, instead of being entrusted to "Biddy," or anything but a good cook. Mrs. Warriner was the queen of the household, who presided in the realm of the kitchen, as well as in the parlor, and, like thousands of her countrywomen of that day, was more proud of her rule and triumphs here, than ever Victoria was of the throne and sceptre of Great Britain.

Afterwards, the Massasoit House was established and became a worthy competitor for the public favor, and finally eclipsed the other house, after the reign of Mrs. Warriner had waned through age, and finally ceased. At this transition period of the houses, when one was waxing, and just before

the other was beginning to wane, an amusing incident occurred, illustrative of both hotel life and human nature. A Southern gentleman, who had tried Mrs. Warriner's home comforts and was greatly delighted with them—especially the table fare—recommended one of his friends about to come North, by all means to stop at the United States, as the hotel was then called. On arriving in Springfield, he requested the coachman to take him to the United States Hotel. He accordingly took him there. When the door of the coach was opened for him to alight, the gentleman remained in his seat. After waiting awhile, the driver, surprised at his conduct, said, "Mister! are you not a going to get out?" "I thought I directed you to take me to the United States Hotel," said the gentleman, equally surprised and impatient with the driver. "So you did, and so I have done, sir—will you be good enough to step out?" The astonished passenger put his head out of the coach, surveyed the premises—then a plain wood structure—and, with a mingled look of disappointment and contempt, addressing the coachman, said, "If *this* is the United States, drive me to the Massasoit." This occurrence was a standing joke in Springfield for years. We remark, however, that the gentleman should have shown more good sense and regard for the opinion and recommendation of his friend. Had he tried Mrs. Warriner's fair linen and fine cookery, the house would have looked all right. But so the world judges from first impressions and outside appearances!

The Massasoit has still a high reputation, after trying the public favor for over thirty years.

Often have we heard gentlemen remark, in different parts of the country, that this house has no superior in the United States. Its rival at the present time, and one of the two best houses in Springfield, is the Haynes Hotel, situated on Main street,

TRINITY METHODIST EPISCOPAL CHURCH.

near State. It is the largest hotel in the city and has a good reputation, though we cannot speak of its fare from personal experience, nor that of the Massasoit, within the last few years.

In the olden time, each prominent citizen thought to know every business man in the place, and almost every person. Judge Morris, the elder,

once remarked that "the time had been not long before, when he knew every man in Springfield." He said this to give force to the proverb which he repeated, and which once prevailed all through the Connecticut Valley, "You know we must summer and winter a man before we can have confidence in him."

though character had gone out of the world, or dropped out of our estimate of men and things. It has, so to speak, been demonetized; or, so badly alloyed as to become uncurrent. In this item we suspect our fathers had the advantage of us; and doubtless some of the business men of Springfield as it is, who have suffered from the specula-

tion, insolvency, and fraudulent tricks of their debtors, would not object to a return of the sound character and business faith that prevailed in good old days of Springfield as it was, when every man knew whom he could trust.

In territorial limits Springfield was many times larger than at present, being some twelve miles square, and containing, if we mistake not, what is now embraced in the townships of Agawam, West Springfield, Holyoke, Chicopee, and Long Meadow, in addition to its present territory. Chicopee was the last to be set off. The population of its former limits is at this time not less than sixty thousand.

The old township was first called Agawam, but at an early date was changed to that which it now bears. Whether the name of Spring-

"DAILY UNION" BUILDING.

It was substantially the idea expressed by Chatham on a memorable occasion, when he said: "Pardon me, gentlemen, confidence is a plant of slow growth." But with our New England ancestors—particularly the staid people of this valley—their confidence once gained was not easily forfeited; and *character* went for much in all transactions. It was a man's accumulated fortune, his life-estate, so to speak. Now it would seem as

field was derived from the town by that name in England, or from the abundance of springs that were found within its limits, is not quite clear. We believe, however, that the weight of opinion favors the latter supposition. It certainly does no violence to facts to suppose this, for there was a great number of springs on the site of the present city, sufficient to form brooks of considerable size, and to be quite an obstacle to building along some of

the streets, particularly under the first and last terraces as you ascend the hill. These facts would give the name a natural and reasonable origin. Many would doubtless prefer the old name of "Agawam," as more classical if not more euphonious, since it comes, not from the language of our civilized ancestors, but from the nomenclature of a race of savages whom we honor by driving off or slaying and retaining their names—which is like killing the bird and keeping his nest or stuffed skin. We think that the passion for Indian names, is taste with a vengeance—certainly with *savageness*.

The climate of this region is remarkably mild and equable for New England, with pure air in summer and but few harsh winds in winter. Oft and again snow is seen upon the distant hills, while it is sunny and snowless in the basin in which Springfield is located. This basin or valley is some twenty-five miles in width by fifty in length, with only one slight break at Mount Holyoke, and far enough from the ocean to escape its harsh winds; and is so sheltered by the surrounding hills and mountains as to escape in a measure, the strong, cold winds of the land. The difference is so marked and so much in its favor, that persons come from the sea coast to enjoy its more favorable climate.

Springfield has one of the best markets in the country, and why should it not, surrounded as it is by the finest farming region in the East? In fact her truck patch is the whole Connecticut Valley; and she is planted right in the midst of a continuous farm, four hundred miles in length, by from five to fifteen in width, highly cultivated and rich as a garden. Much of her choicest beef

and mutton is supplied from her Valley and the hillside farms that border upon it; and most of the vegetables, except the very earliest, which are brought from the South, come from the immediate vicinity and of course are much more fresh, palatable and wholesome, than those that are transported a great distance and deteriorated by keeping, as is necessarily the case with most other markets of the country. The finest melons—crisp, sweet and juicy—are raised here that are grown in any part of the country. And it is a well-known fact, that this Valley, especially in the lower half of it, can beat the world in the quality of the noxious weed that it raises. It is used chiefly for wrappers and is noted for

the fineness and toughness of its fibre. Before the quality of this tobacco was known and approved by the public, it was sold in New York under the name of "Finest Havana Leaf." As we passed through the Valley, up and back, the other day, we saw hundreds and thousands of acres of this plant, rank and luxuriant in the highest degree, and beautiful too, were it not for the waste and nuisance that is in it. It has a tropical rankness and beauty, especially

when seen in large fields. But then, we could not help thinking—and we may as well give the reader the benefits of our moralizing—of the millions of money that it annually wastes, and the thousands of acres of the choicest lands that it occupies and draws the life and marrow from, that had better be devoted to raising bread for starving children—and all for what? Why to furnish a useless, injurious and very *costly* weed.

Among the features of interest in Springfield, the United States Armory has ever occupied a

STATE STREET BAPTIST CHURCH

leading place. Its location on the crowning summit of a beautiful plateau several hundred feet above the Connecticut River, leaves nothing to be desired in this respect; its facilities for manufacturing arms are ample, and its machinery of the most approved kinds, most of it invented here, and much of it having been copied in Europe. The rules and discipline are excellent, whether under civil or military supervision; the quality of the work is equal to that turned out at the manufactory of any nation in the world; the grounds, containing over seventy acres, are beautifully ornamented, and these with all the buildings are kept in the best possible condition. The turning of the gun-stocks is an exceedingly ingenious process, an American invention, and once regarded with a great degree of interest. It is said that when Kossuth was in this country, and visited the armory at Springfield, he regarded this device with more interest than any other among all the processes. No doubt the great Hungarian thought that the products of this machine, with all the other means at the command of the Americans, if they could once be placed at his disposal, would enable him to achieve—what he so much desired—the independence of his country. The same process has been applied to the turning of wagon-spokes and various other articles of daily use.

There is one rule which we presume is still in force at the Armory, that we will mention. The United States Government very properly desires great perfection in the arms, both in the materials, the body of the work and the finish; to secure this requires the strictest caution on the part of the inspectors, and skill, care and responsibility on the part of the workmen. Hence, when a defect, or the slightest flaw is detected, at whatever stage of the processes, the loss is made to fall upon the one who should have first discovered it, though it lead back to the man who forged the barrel or other part; and the careless or unfortunate workman must not only lose his own labor, but the price of all that has been added to it by the work of others.

Of the arms thus carefully made, and embodying the latest improvements, two hundred and seventy-five thousand are kept constantly stored by the Government for emergencies. They are most artistically erected in cases or bodies in upright position, pointing with almost mathematical exactness to the zenith and nadir, or centre of the

earth. Thus standing, and glittering in the light like pointed tubes, the sight struck the poet Longfellow, as resembling a huge organ. Yes! they are a vast organ of life or death, according as they are used and accomplish results; but we hope the day may not be distant in the good time coming, when they will no longer be needed. Till then we must trust in the Lord, and "keep our powder dry."

From one-fourth to one-half million of dollars are annually disbursed here through the United States Armory, largely to the advantage of Springfield. During the late war it amounted to over twelve millions of arms in all, and many millions of dollars annually, the benefits of which are still felt here; for instead of encouraging the enterprising citizens in apathy and idleness, it served to stimulate them to undertake new and important enterprises, many of which are in active and successful operation to-day. The population rapidly run up from fifteen to twenty-seven thousand, and by the State census of 1875 was found to have reached over thirty-one thousand; since which time, under the great stress of business, it has just about held its own, and but for its wise and fortunate variety of arts and industries could not have done this.

The most important of the Arsenal buildings is the Armory, so called, in which the arms are stored, in the neat and tasty manner which we have described. On the top of this building there is a broad tower of semi-feudal style. The location of this building is very fine, and the scene from it is one of great extent and unsurpassed loveliness. It affords a magnificent birds-eye view of Springfield and the surrounding country, and none who visit the Valley should miss seeing it.

Finally, it may be said of Springfield, in view of its fine location, its facilities for business, its numerous and valuable industries, its excellent intellectual, social, and religious privileges, that few places offer greater inducements to the business man, or more attractions as a place of residence. A more busy or delightful place is not to be found in the length and breadth of the Connecticut Valley, the region of beautiful towns, cosy, charming homes, and fine, picturesque views; and taking into account its location and make-up, it would be no easy task to find its superior in any part of the country.

## THE ANCIENT SLEEPY HOLLOW CHURCH IN TARRYTOWN, ON THE HUDSON, NEW YORK.

BY REV. WILLIAM HALL.

THIS antique-looking edifice, very accurate pictures of which as it now stands are given in connection with this article, is the oldest house of worship in the State of New York yet spared by time and change. It has from the first belonged to and been used by a congregation of the Protestant Reformed Dutch Church. Over the doorway is inserted a tablet telling its origin, and bearing the inscription: "Erected and built by Frederic Philipse and Catherine Van Cortlant his wife, in 1699."

In honor of these distinguished persons and their family, on whose Manor estate it was built, this sacred structure was called the Philipsburg Church, and the religious society worshipping in it was incorporated or registered under the same title.

To an Historical Discourse, preached in 1866 by the Rev. Abel T. Stewart, a former pastor in Tarrytown, with a copy of which we have recently been favored by a respected lady having a tender regard for this venerable landmark, we are indebted both for the picture and the chief facts here presented.

With regard to its exact age and other particulars, Mr. Stewart has given the following interesting account as the result of his opportunity of inquiry among older parishioners: There is a tradition concerning the erection of this house which may show that it was begun as early at least as 1694, when the church was organized. As related by one of the most excellent of our now departed members, it is that Mr. Philipse, aided especially by his wife Catherine, began to build the church edifice two or three years before he finished it; that he laid the foundation, and then began to repair the dam at the mill; that when the dam was built a freshet came one night and washed it away; that he then erected a new and better dam, and the waters washed it all away again; that while he and his family were in great distress about their loss, his old slave Harry had a dream, and for several nights the dream was repeated, to the following purpose: That God was displeased because Master Philipse had stopped building the church to build his dam, and that it

would never stand until the church was built; that he must go on and build the church and then the dam, and it would stand. Harry told this dream to his master and mistress, and they were both so much impressed by it that they built the church and then the dam; and it stood.

The edifice, however small and unpretending in architecture, was built with great care and exceeded in some of its materials the ability of the country at the time of its erection. The small yellow brick, a few of which are still retained in the sides of the present entrance, were brought from Holland, and gracefully set above the original door in the south side and around the windows. The windows, that were originally Gothic, have been enlarged and made square. The panes of glass that were of very small size, have been changed for larger ones; and the heavy crowbars of iron that precluded entrance, even when the sashes were raised, have been removed. The door has been transferred to the west end, facing the street. The pulpit was in form a regular octagon, and the sounding-board a regular hexagon. Both were small, for the most part of mahogany, and brought also from the Fatherland. They have been taken away and scattered, so that scarcely a vestige of them can be found. The ancient gallery on the north side, where the choir once stood, is taken down, and that on the west side is widened and extended from side to side. Originally the seats were benches, with the exception of a long and elevated one on each side of the pulpit, covered with a rich curtain for the special use of the Philipse family. It is said that Lord Philipse occupied the one and his wife Catharine the other.

At the close of the Revolution the minds of the people had undergone a great change, and in repairing the edifice they rudely tore down the rich awning, pulled out the iron supporters from the wall, and made the thrones, as they were called, convenient pews for the wealthy elders and deacons. They also changed the naked benches into pews for the congregation, and said they would have no lords and kings, but that all

the worshippers should be on a level. The character VF cut upon the vane mounted on the east end of the building, are the initials of the founder, Vredryck Flypse. The bell that still rings out so shrill, was cast according to order in Holland, in 1685, and bears besides its date, the inscription, "*Si Deus pro nobis, quis contra nos?*" It is with-

Flypse, and the other of Catharina Van Courtlant. The bowl is eight inches and a half in diameter, and is also inscribed with the name of Fredryck Flypse. This bowl, with one of the beakers, the table and a damask cloth of specified dimensions, were given by will of Mrs. Philipse, in 1730, to her son-in-law, "in trust to and for the congregation of the Dutch church erected at Philipsburg, by her husband, deceased, according to the Synod of Dort."

In the ancient record-book of the church, written in Dutch, this eminent lady is spoken of as "the Right Hon. pious, very wise and provident Lady Catharine Philips, widow of Lord Frederic Philips, who did here very praiseworthy advance the cause of religion." In manifold labors for good, among others, relieving her husband from the care of building the church edifice, and procuring ministers from a distance at her own expense, Mrs. Philipse is well reported of as having been "no ordinary disciple of Christ, who, when she had filled up her day in usefulness and ripened for heaven, fell asleep in Jesus, and was buried in a vault under the floor of the edifice she had so nobly erected," the whole weight of which now resting, as far as possible, on the entrance to her tomb.

Of the nine ministers of this church who since its erection have stately officiated within its walls the first was the Rev. Guillaume

Bartholf, viz., from 1697 to about the year 1716, who gathered many souls into the kingdom.

The next whose name appears on record was the Rev. Johannes Ritzema. He was educated in Holland, and was one of the pastors of the Reformed Dutch Church in the city of New York, from 1744 to 1784, when he was declared Emeritus. His name appears frequently on the minutes of the Coetus, the Conferentie, the Convention and the General Synod; and, says Mr. Stewart, he seems to have been honored more any than of his contemporaries in the church with offices of position and trust. This learned and excellent man

FRONT VIEW OF SLEEPY HOLLOW CHURCH, TARRYTOWN, NEW YORK.

out doubt the oldest now known, cast for the use of a Protestant church, in America.

Mr. Stewart also tells us that the communion table and service were ordered at the same time. The table when drawn out for the guests, who in successive groups sat around it, filled all the open space in front of the pulpit. It is of massive oak, inlaid with ebony. The service, consisting of one plate, two beakers and baptismal bowl, are of silver, and of the finest make and character. The plate is unusually large and heavy. The beakers, or cups, are about seven inches high and richly engraved. The one bears the name of Fredryck

labored also much in the contiguous churches of Harlem, the Manor of Fordham, and the Manor of Cortlant, more or less, as in that of Philipsburg, until the commencement of the Revolutionary war. Mr. Ritzema, the only clergyman of the name ever known in America, died and was buried in Kinderhook, New York, in 1788, at the advanced age of seventy-eight.

He left many to inherit his blood, who now represent him in various lines of family descent, but we are sure none more worthily than the Rev. Robert Russell Booth, D.D., the well-known and greatly esteemed pastor of the University Place Presbyterian church, in the city of New York. He preaches in English in the same old city where good Dominie Ritzema, his ancestor, preached in Dutch, and his earnest and eloquent voice has also been occasionally heard in the ancient Philipsburg church, where that faithful "*Verbi divini minister*" officiated in its primitive days.

The various and beautiful associations of this hallowed and time-honored edifice with both the romance and the history of the past, combine with the memories of the sleepers thereabout, justly to commend it to a continued conserving care for the future. Its site is on the northern edge of the "Hollow," rendered so famous by one of the bewitching stories of that American classic, "*The Sketch-Book*."

In the same vicinity is also the scene of the capture of Major André, and close at hand, the loved home of our world-famed Washington Irving, his "*Sunny Side*," *alias* "*Wolfert's Roost*," where the wholesome sunshine of his genius so long shone forth, and which was originally owned and occupied by Wolfert Ecker, one of the original elders of the Sleepy Hollow Church. But its local characteristics let now that charmed pen describe:

"The sequestered situation of this church seems always to have made it a favorite haunt of troubled spirits. It stands on a knoll, surrounded by locust trees and lofty elms, from among which its decent whitewashed walls shine modestly forth like Christian purity, beaming through the shades of retirement. A gentle slope descends from it

to a silver sheet of water, bordered by high trees between which peeps may be caught at the blue hills of the Hudson. To look upon its grass-grown yard, where the sunbeams seem to sleep so quietly, one would think that there, indeed, the dead might rest in peace. On one side of the church extends a wide, woody dell, along which raves a large brook<sup>1</sup> among broken rocks and trunks of fallen trees. Over a deep black part of the stream, not far from the church, was formerly a wooden bridge, the road that led to it and the bridge itself being thickly shaded by overhanging

REAR VIEW OF SLEEPY HOLLOW CHURCH, TARRYTOWN, NEW YORK.

trees which cast a gloom about it even in the daytime, but occasioned a fearful darkness at night."

The illustrious name of Irving will ever be entwined with the record of the ancient house of God here depicted. And let the following exquisite verses complete the pleasing association on the historic page:

"Pocantico still rolls his stream  
Beneath the bridge of Irving's dream,  
As when he heard the tramp and scream  
Of Ichabod, that fearful night  
When Brown Bones gave him such a fright."  
"The rivals sleep, and with them he whose wand,  
Hath made their names so famous in the land;  
By the old church they sleep,  
Beyond death's stream,  
No more to laugh and weep,  
No more to dream.  
With thousands in God's Acre they repose,  
Where the hushed wind in gentlest whisper blows."

<sup>1</sup> Called now Mill River, or Pocantico by the Indians.

## THE WRITINGS OF GEORGE ELIOT—THEIR MERIT AND INFLUENCE.

BY J. R. HASKINS.

## IN TWO PARTS.—PART I.

WHENEVER a work from the pen of George Eliot is announced, an epoch in the domain of literature is attained; and when we consider that this rare distinction has been earned and reaped by a woman, the *Io triumphe!* that rings from the ranks of the strong-minded faction need not surprise us. Indisputably, she has legitimately won her laurels; and if in choosing her *nom de plume* she designed it as a gauntlet of defiance, she certainly has not failed in her claim of conquest; for Mrs. Lewes ranks to-day above every one of her male competitors, in the same line of literature, on either side of the Atlantic, evincing greater depth, wider erudition, and keener analysis; soaring even at times to heights where only superior intellects can follow. Indeed, those who seek the usual sensational interest of a kaleidoscopic story alone, will have but little appreciation for her more elevated and suggestive works. Lacking the freshness and delicacy of the touch that characterizes her sister-peer, George Sand, who lingers ever more in the valley among the birds and flowers, her more sombre rival climbs the mountain summit, grasping all its tone and grandeur, never fearing to stand even upon the crater's edge.

From her first powerful work, "Adam Bede," to "Middlemarch," she has steadily acquired force as well as popularity; but her supreme power bloomed in "Romola," and shone even more brilliantly in her one dramatic poem, the "Spanish Gypsy;" and we think she was fully justified in her disappointment, that this child of her deepest love and most earnest travail has never attained the position or reaped the reward it merited.

The productions of this author have revived in our day the vivid interest and warm reception that were bestowed upon the novels of Fielding, Richardson and Smollett in the last century. It will, however, be but an equivocal compliment to the former to make any comparison as to style or choice of subjects; just as it will be difficult to find any readers now raving frantically over the woes of Clarissa, bewailing the long-tried virtue of Pamela, or embracing in the disgusting vul-

garity of Humphrey Clinker the pure and sparkling humor of Thackeray, Dickens or Lever.

It is not so much the mere surface foam of George Eliot's writings that possess such a magnetic attraction; beyond this, there lies the latent power, the anatomical skill, that bares the heart and forces to the surface the secrets that are destined to bless or curse a life. Like Goethe, or our own Hawthorne, she has undoubtedly learned to "live in other lives," and thus solved the mystery that controls their hidden springs. Her characters are moulded as plastic matter in the hands of the artist, and they are shaped into beauty and warmed into realism with the art of an accomplished sculptor. She throws the whole weight of responsibility, not upon circumstances, or the accidents of position; but by a waive of her magic wand, she evokes the passions, the caprices, the latent treachery, or the smouldering malice; and in antithesis to these passions, arise the heroic struggle for conquest, the patient endurance, unswerving vigilance, and fidelity at the post of duty; and as each moves to the accomplishment of fate's decrees, they invoke in the contest, either the flaming sword of Michael, or the green laurels that crown the barbed point of Ithuriel's spear.

Although in point of style she is not so musical as Ruskin, or as luminous as Macaulay, yet it is rich and picturesque, though verging at times, like Johnson, upon the ponderous and verbose. Carlyle's warning to *effete* litterateurs can call no blush of presumption to the cheek of George Eliot: "To speak or to write, Nature did not peremptorily order thee. Believe it not; be slow to believe it." Her harvest points to the genuine source of its richness. True, the tree has been planted and flourishes, but the fruit is not all yet garnered; to some it may bring nourishment and refreshment, but to others, who can say that it may not, for all its tempting bloom, "set the children's teeth on edge?"

In her most recent production, "Daniel Deronda," there is marked evidence of the deep study and protracted toil that it is said she bestows upon her work; laboring on an average six hours a day,

yet rarely accomplishing more than from three to four hundred words. This is a corroboration of Henri Taine's theory, who, in his "Art Life in Greece," says that even after *fifteen years* of hard study, only the novice is created, and constant diligence, united with experience, must follow before any successful results can be realized. As a panacea, however, to this discouraging *dictum*, Pliny (according to Boyle) deprecates the misery that some authors inflict upon themselves by constant trimming and pruning; "Instead of perfecting the word thereby, giving it more nerve and strength, they only weaken and dispirit it." This is a digression which, however, we trust will be excused, as proffered consolation to those novices, who write *ad libitum*, and who dread the fetters that constant revision entails.

Recalling the various emanations from the brain of George Eliot, we claim for "Romola" the birthright, as being indisputably the voice of genius. It is rich in dramatic effect, and vibrates with the warm pulses of that higher life of which in part it is the exponent. The eyes of the interior spirit opened and expanded under a ray of heavenly light, and in realizing the book, we wonder how she could so readily and deftly have leveled her mind to the cold materialities and realism of her subsequent productions. The time and scene chosen were auspicious. Florence the beautiful—the synonym, the queen-regnant throughout the world, of all that was great in name and noble in deeds; struggling in the grip of the traitor, or the avarice of the *condottieri*, under the white heat of political factions—anon the ball of confusion, or the servant of order and fervent patriotism; glorified by her saints, dismembered by her sinners; battling with ignorance, bigotry and oppression, with weapons tempered by Religion, gilded by Art, and strengthened by Philosophy. Truly, the author has grasped the classic spirit of the age. The fillet of Pagan Greece and the cross of the Latin race blend in the shifting colors of her web, and she has woven them deftly into a panorama that is gorgeous in tone and effect. The characters, too, are endowed with a personality as vivid and enduring as their own plastic art, and are developed from their most simple and natural phases, through their widest intellectual scope and sharpest psychological struggles. The heroine at first disappoints us, as she stands so picturesque amid the antiquities of her

blind old father. A maiden in that era void of religious training, or of faith in the supernatural, is rather an anomaly; for the gayest, and even the most depraved, in that day, held to some part of Christian belief as an amulet for some exigent moment of life. But this lovely type ("Romola") of a heathen vestal, eventually looms into a glorious womanhood under the pressure of the heart's despair, and finds at last its true harmony, its supernal strength, alone under the triple crown of faith, love and duty.

The leading inspiration of this book was undoubtedly the grand character of the celebrated Dominican Monk, Savonarola, and we must confess that she limns him in every striking point, with the finish of an artist and the truth of a conscientious historian. His works, his heaven-inspired zeal, his self-abnegation, his great tender-heartedness, his abhorrence of shams and subterfuge, his purity of life and disinterested patriotism, are all vividly portrayed. In those apocalyptic visions which illumined his own soul, and as he believed directed his course, we see a repetition of those supernatural endowments that had anteriorly been vouchsafed alike to the heathen oracle, the Cumæn Sibyl, and the Pagan poet. Why then should they not be accepted as flame from the mount when enunciated by the lips of one so pure of life, and so exalted in motive? "But the light shineth in darkness, and the darkness did not comprehend it." His angelic reverence, which glowed like an unquenchable flame with the love of God and his creatures, symbolized, as it were, that cruel material fire, which was ultimately kindled by a blind fatuity, as the sole earthly reward of all his labor and sacrifices in behalf of the temporal as well as the spiritual needs of his countrymen. But the justice of time rarely fails, and thus the reversal of ages now crowns him with the aureole of the martyr, and stamps his name among the most memorably renowned in that glorious epoch of Florentine history. George Eliot has grasped with a firm hand the general traits and genius of this exceptional man. The nimbus of his sorrow and suffering, of his glory, seem to have o'ershadowed her, and his grandeur in the supreme moments of his career, has tinted her picture with colors as glowing as were his virtues and endurance. Yet the sublime faith, the supernal love that lay at the root of this heroic life, fail in their truest lesson

to reach her soul. "Power rose against him, not because of his sins, but because of his greatness—not because he sought to deceive the world, but because he sought to make it noble. And through that greatness of his, he endured a double agony; not only the reviling and the torture, and the death-throe, but the agony of sinking from glorious achievement, where he could only say: 'I count as nothing; darkness encompasses me; yet the light I saw was the true light.'" ("Romola," page 247.)

Presuming that her most recent work, "Daniel Deronda," is familiar to our readers, we intend only to analyze in part the main characters, as a demonstration of the philosophy of a book that may be ever potent in its influence. There is apparent a strong evidence of sympathy between the philosophical principles of George Eliot and the cultus of Herbert Spencer, Huxley and Tyndal. To the influence of these modern pessimists must be largely attributed the pantheistic spirit that pervades, more or less, the majority of her works. The dangerous tendencies of these philosophers have already produced bitter fruit. The subordination of the supernatural and spiritual elements to the material, excludes the highest incentive, even as it embraces the lowest results. Such writers ignore the natural depravity that is ever restless and seething under the pressure of fixed and indestructible laws. Even by their own creed they demonstrate the truth, often asserted and widely proved, that "in the depth of human nature there lies an imperishable instinct of Paganism, which reveals itself in every age, and is not extinct in our own, which ever willingly returns to Pagan philosophy, to Pagan law, to Pagan art, because it finds therein its dreams realized and its instincts satisfied."<sup>1</sup>

The character of the heroine in "Daniel Deronda" has elicited too wide an interest and speculation to be passed over in silence. Indeed, in Gwendolin centre the main incidents of the story, even as she serves as the *plastique* upon whom the author bestows, like Pygmalion, a beauty and charm that under her chisel "lives and moves." Trained as she had been in a godless school, worldly and egotistic in its fullest and most direful sense, it is not surprising that, imitat-

ing the old Roman emperors, she should deem herself a fitting recipient of god-like honor.

Bright and soothing as were those vicarious flashes of tenderness that beamed for her mother alone, yet they fail to redeem her clouded perceptions and that innate void of womanly sensibility that was manifested in every other relation. Her high spirit, her statuesque beauty, we must admire; but, like all sirens, she lacks the qualities that distinguish the pure in heart; although as she reaps the penalty of her perverted principles and violated conscience; as the Furies, in lieu of the Graces, greet her upon the threshold of her bridal home, we are moved to pity, and can freely give her our most sympathetic commiseration. Marriage, unsanctified by love, has no terrors for her. Throughout the interior strife that precedes her decision of this vital point, weight is given to every minor consideration, save the solemn and elevated sentiments that give unction and sanctity to the bond. Love as an element to life's perfect fulfillment, she unnaturally ignores.

When brought into direct contact with such a man as Henleigh Grandcourt, we can partially understand the fascination that one so cold and self-sustained might exercise over a temperament like Gwendolin's. Such men possess a magnetic power, and distil a glamor, which suggests the idea of latent force and possible heroic achievements. Women are apt to be dazzled and won more frequently by quiet and undemonstrative men than by the more ardent and importunate. There is a certain blinding iridescence about such love-making that wins and binds, as did the guile of the serpent in Eden; ay, and like that, too, when the spell is broken, often proves the charmer hideous and the fruit deadly.

As a type, no doubt, Grandcourt may be matched among Englishmen; but according to general experience, his character is both unnatural and incongruous. That a man in the prime of thirty-seven years could be so neutral in principle, so void of all vital energy, so passionless, yet so persistent and obstinate, save when under the incentive of opposition, does not tally with the promise and deeds of his earlier years. No withering blight had fallen to divert or crush the hopes and aims of his youth. Once having loved—true it was not the hallowed affection that can give generously and endure bravely through all time and change—still without some fearful shock

<sup>1</sup> History of Civilization in the Fifth Century. A. F. Osanam. Volume I

to uproot the whole tenor of an emotional life, a man could never become so imperturbably cold, so utterly beyond the reach of all emotion, so barren of joy, so dumb under pressure of natural feeling, in a word, so reduced to the mere remnant of a human being, a wound-up automaton, that petrifies you with its glassy eye, until one is fairly driven into madness.

Neither do these transitions comport with the gentle courtesy, the delicate consideration, or the refined tenderness of his courtship; all of which is metamorphosed before the bridal flowers are withered, into the manner of a bristling hedgehog and the tyranny of a Blue Beard. Men may be vulgar tyrants, may grow utterly callous and dead to all refinement of sentiment, and utterly *blasé* as to all enjoyment; but these changes approach insidiously, and not without the pleas of some extenuating circumstance. This course of the husband naturally served to develop the germ of that Median spirit, which was gestating in the rebellious, dominant temperament of Gwendolin, yet ever kept in abeyance by the dynamic force of her tyrant.

But exceptional if not unnatural as these two characters appear, we cannot be blind to the intricate psychological analysis, the dramatic power, and the complex motives and plot that are so artistically woven into their lives, without admitting the genius of such a creation.

Adam Bede, Felix Holt, and the other heroes of George Eliot, are all hewn from the same block of granite. Daniel Deronda also belongs to this invulnerable brotherhood, only that upon him she has bestowed finer finish, higher polish, and her most artistic idealizations. For him the rough lines, the jagged edges are all toned down to perfect symmetry. He is endowed with the elegance and accomplishments of a Crichton, the bravery and self-sacrifice of Sydney, and the purity and chivalrous spirit of the knightly Gallahad. He carries a charm wherever he goes, and bestows gifts and blessings like "Merlin, the wizard." Devoid of the pride and arrogance that might naturally have resulted from his education and social surroundings, his heart is ever open to the needs of others, and he descends as gracefully to the plane of the Jewish shopkeeper as to the rôle of knight-errant. The mystical affinity that drew him to Mordecai was naturally born of the poetical and introverted phase of his organization. Few,

thus constituted and endowed, could have resisted the spiritual discernments, the solemn eloquence and fervid rhapsodies of this modern Jeremiah, who is ever lamenting in kindred eloquence and the pathos of a dying Seer the woes of his people, and the pending doom of a degenerate race. He is certainly a grand character; a Moses *redivivus*, gazing with tear-dimmed eyes and an ever aching heart from the mount of vision, upon that far distant land of his love, whose beauties and time-hallowed holiness can never bring a benison to him. Touched with the richness of this spiritual life, his sister Mirah says to him: "You are a spring in the drought, and I am an acorn cup; the waters of heaven fill me, but the least little shake leaves me empty." And he, in striving to direct her life and console her sorrows, says, "whether happiness may come or not, one should try to prepare oneself to do without it." Every one must feel the truth and beauty of these two quotations.

If the author of this work is under the influence of any defined religious sentiments, they certainly must be closely allied to Judaism. Yet we have never heard that she was of the house of Israel by birth, although judging from her admiration of that people and their tenets, as evinced in this book, one might suppose this to be the case. The Disraelis, *pere et fils*, have never lauded more eloquently the virtues or deprecated more sorrowfully the degeneration of this once God-chosen people. Whether she belongs to it or not, the Semitic race is evidently the one of her closest predilection—otherwise, whence the *animus* of that glowing tribute bestowed upon the subject?<sup>1</sup>

These views seem corroborated by the facile manner in which she carries Deronda with a bound over all holy associations, to kneel at the tabernacle of his forefathers—even settling his predilections in that groove long before he had any positive assurance that his lineage sprang from the house of Israel. That a man who had been educated solely under Christian auspices, his mind imbued with the glorious results and promises of the new gospel—who believed the life and doctrine of the God-man, and through him the complete fulfillment and realization of the prophetic voices of the old law—that such a scholar could hear without emotion, and receive without any

<sup>1</sup> Since writing this we have heard that her husband, Mr. Lewes, is an Israelite.

shock of horror, the assurance that he was an alien to this house, wherein were garnered his most cherished affections—that he was pre-ordained to defile the sanctuary of his life, the tabernacle of his immortal hopes, profane and apostatize the adorable and all-saving name of Jesus-Saviour! such a suggestion could surely never find entrance into the most vivid imagination of a self-poised, thoroughly grounded Christian, save as an anomaly to be held up to public condemnation. But such is not the inference. Deronda in weighing the chance truth of Mordecai's intuitions, accepts passively, without any shock to old associations, the future consequences of his birthright in both its social and religious aspects, never realizing that duty to one need not necessarily involve sacrifice to the other. Love of race, we know, is inherent, yet a true Christian would have felt that he could serve his people far more efficaciously, like Saul of Tarsus, by striving to reclaim them from the errors that had wrought their ruin, rather than by fostering an antagonism to the all-saving truth of the new dispensation.

Any consideration of the character of Daniel Deronda would be imperfect, without embracing, as a pendant, his peculiar relation to Gwendolen.

Forced and anomalous as in the beginning seems the subtle influence of a strange man, in awakening and directing the dormant conscience of so imperious a girl, yet so dexterously are the complex circumstances woven in this web of entanglement for both lives, that the probable yields to the possible, and only the sympathy of the audience for this helpless, lonely woman remains. "In the wonderful mixtures of our nature, there is a feeling distinct from that exclusive passionate love of which some men and some women are capable; which yet is not the same with friendship, nor with a merely benevolent regard, whether admiring or compassionate." (Daniel Deronda). All men are moved in their noblest instincts by the trust and reliance of one who is weak or suffering. Hence, when Deronda found himself in the position of sole confidant, and possible saviour of her life in its tempest of

remorse and fear, his chivalrous heart led him to the rescue. Love in its sensuous essence had not taken form, but in its highest human aspect it was moulding her thoughts and actions. To many, especially those cold self-sustained natures that never need support, this position of enforced confidant, into which Gwendolen drew Deronda, will seem as it is unwomanly and indelicate. But when all the circumstances of her position and natural reticence are weighed, we find as the plot develops, these qualities forced from her usual calm, self-sustained basis, by the tension of pain and conflict that environed her. In Deronda she was sure of a sincere candor, a deep wisdom, and high moral rectitude that placed him above all others. He was an ideal oracle, a sort of tutelary divinity, whose voice could never be dumb to her pain.

Gwendolin undoubtedly had invoked the terrible retribution that culminated in the death of her husband, for like an augury of evil the crime of *Clytemnestra* had entered her heart and held it with an iron vice until the moment for repentance, or rather atonement, had passed.

Absorbed as were all Deronda's feelings in the new life that had been awakened by the recent revelations of his mother, he could not be dumb or passive to the cry of anguish that went out to him alone, "My desolation does begin to make a better life," neither could he refuse, even to the concealment of his own sensations of horror, to soothe and sustain this desolate, conscience-stricken woman. Gwendolen's deep remorse, and her desperate struggles for the attainment of a higher and better life, after the death of Grandcourt, are somewhat analogous to the aspirations of Dorothea Brookes, the heroine of *Middlemarch*. In the latter, however, there really existed a stratum of the spiritual element, which, in the strife the stoic philosophers of old was ever seeking, like the dove from the ark, a safe resting-place. But in Gwendolen only the Pagan phase of conscience is apparent—hence both failed for want of a guide to truth, and the search terminates only in abstractions that may bring a lull, a quasi sense of peace, but never a perfect fruition.

## THE AMAZONS OF MEXICO.

(FROM THE PEN OF A TOLTEC HISTORIAN.)

TRANSLATED BY ELIZABETH OAKES SMITH.

## CHAPTER III.

THERE shall be lovely houses built for those who desire the marriage state. They shall be the color of a rose. Every woman shall feel it her privilege to help adorn these houses, her privilege to render the wife joyous in her wifehood and motherdom. Songs at the bridal thanksgiving, at the birth of a child, and helpfulness in every way shall combine to render the marriage state one of honor as well as happiness. The pretty lullaby of the contented mother will be listened to with delight, and the honors of the marriage state contribute to the prosperity and general well-being of the community. There will be no sound of discord issuing from the marriage bower, no brawls, no discontent, no distress; but on the contrary a perpetual peace and joy. There will be no wailing of neglected and suffering children, but nothing save the careless, loving tones, and happy laugh of infancy.

Once in the year a great festival shall be held outside the walls of the city, which shall last for one month. This shall not only be a festival, but a fair also, at which the community shall exhibit for sale or exchange all surplus commodities raised by the taste or industry of the women. At these festivals the people of the surrounding nations shall be expected to appear, with the flower of their youth no less than with the wisdom of the Elders. These shall compete with the maidens and matrons in music, poetry, and in all those exercises pertaining to health and skill, such as running races, dancing, leaping, etc. Prizes shall be awarded for superior excellence in the finer arts, and elegance, combined with dexterity in exercises of various kinds. Suitable officers shall preserve order and decorum. The women shall be at liberty to avail themselves of improvements of various kinds brought by the other sex to these festivals, by means of purchase or exchange.

At these festivals the most beautiful of both sexes and the most accomplished of each will be brought together. Lovers of either sex are permitted to make known their preferences to the

Elders. This preference will naturally be for the best of either sex, and no opposition can exist. Before the close of the festivals these lovers shall signify their wishes, their names shall be registered, and this shall be considered the betrothal. At the next ensuing annual festival these lovers shall be married, if still of the same mind, and for one month occupy together the marriage bower, at the end of which period the young husbands shall all depart and see their wives no more till the next annual festival. In the intermediate time they will not be permitted to dower about the walls of the city, nor expend their time with songs and lutes in honor of their lovers, but shall all the year do manly service in the community to which they belong; such as training their boys, studying the motions of the heavenly bodies, building roads, and cultivating the earth. Should they be irresistibly led to lay a bouquet at the feet of their ladies, the sentinel on guard may receive such offering on the point of her spear, and have it conveyed as desired; but these demonstrations shall not be encouraged in either sex, as tending to dreaminess and discontent.

It may not unlikely occur that the same youth or maiden will be the choice of more than one; in such case the claims of all shall be withdrawn, and the parties may take their chance by drawing. Those who are willing to risk themselves in this way may do so, or they may compete in music, poetry, or even a dance or foot-race. Men if they choose may do battle with each other outside the walls for the love of a beautiful girl, but this will be rather tolerated than approved by the women. A woman soldier may also be permitted to fight for her husband, and shall be escorted outside the walls, where she may do battle with her maiden rival or even with the other sex, whom if she disarm she is supposed to have won. (These concessions were made at the earnest entreaty of the soldiers.)

[In this connection are various comments by a modern hand, in which the women are handled

without gloves. Amongst other things it is said a man is a fool to marry a woman who fights before marriage, she being sure to do enough of it after, etc.]

Lovers having been a year betrothed, and at the expiration of that term being still desirous to adhere to the same, may at the yearly festival signify their wishes, and join the honored and exalted band of those who enter the marriage covenant. On the day appointed they shall be escorted to the great Temple in the midst of the City by a band of younger maidens and younger men from the district from whence the bridegrooms have come. In no case shall the attendant youth outnumber the candidates for marriage. Each couple shall be united by a wreath of flowers, which shall pass over the shoulders of each, symbolizing union and the lightness of the yoke imposed. Arriving at the temple they shall place their hands upon the altar, and the Priestess shall call upon the Supreme God to bless them, and render their union fruitful and joyous. Then each bridegroom shall loose a dove which he had concealed under his robe, from his breast, and the bride shall lay a white lily upon the altar. After this ceremony the married pair shall be privileged to dwell in the houses called the Marriage Bowers together for one month, after which the husband shall go back to his own city till the next yearly festival, when he will return. During his absence the wife shall not merge herself in one of the groups, but shall be honored as belonging to the holy marriage bond, and dwell in her own bower. She may choose her friend and companion to dwell with her, and the one so selected will esteem it an honor.

Boy babies are expected to grow into men; therefore, mothers shall not be permitted to dawdle and fondle children overmuch. Their naturally engaging and pretty ways shall not be too much the subject of comment or caresses, as tending to imbecility of mind and sensuality of character, which result in national weakness or corruption; on the contrary, from the first children shall be laid upon their backs, and allowed to kick and struggle to help themselves. Outcries of rage shall be disregarded, but every natural want religiously attended to. The use of the limbs, the right carriage of the body, and the rudiments of self-control will thus have been early established. As the yearly festivals come around, the boys,

something more than a year old, will be given to the care of the fathers, who, by their annual visit to their wives will have learned to feel redoubled tenderness for the mother, and will receive with joy and gratitude the beautiful offspring of their mutual loves. The child, not having been treated with foolish indulgence, will not cling to the mother, but with a manly instinct hold out his strong young arms for the companionship of the father, who leads him forth with a look of triumph. Thus will men find their own communities enhanced in health and manliness by these tender but self-reliant wives.

As the married pair are united by their own desire, uninfluenced by any extraneous motive, such as wealth, position, or helpfulness of any kind, as neither party by marriage obtains any possession of the other by which his or her personal freedom is curtailed, there will be no divorce. Should either party die, the survivor shall be allowed to marry again, though the state of widowhood will be considered the more honorable. Should the wife at any time prefer a state of life independent of the marriage relation, it shall be her right to do so, in which case she shall send to her husband the flower, which contains a dove at its heart, which symbolizes holiness, and he shall no more molest her, and she shall go forth from the marriage bower and join herself to one of the groups, taking her daughters with her. Should a husband absent himself from his wife in a manner indicating that he desires not to return, such wife so deserted shall not marry again, but shall go forth with her daughters from her bower, and devote herself to such pursuits as shall best promote her own happiness and the good of the community. Such recreant husband shall not be allowed to appear again at the annual festival, nor shall he be in any way molested. He will have proved himself unfit for the sacred enjoyments of marriage, and shall be suffered to depart in peace.

While the wise matrons were resting their forces, preparatory to their journeyings to the South, and were forming suitable regulations to insure the well-being of the community, they were aware that a constant inspection of them was kept up by the people of Palenqué. Sometimes a group of merchants appeared for the purchase of the exquisite cloth made from the cotton tree, in the manufacture of which the women greatly excelled. Others purchased fringes of gold and

robes colored from rare shades of the indigo plant and the small insect cochineal. Magnificent garments constructed from feathers of rare birds they were expert in making. Rich confections of the palm and cocoa, tortillas from the corn plant, sago and guava—jellies from various fruits also. They were skillful in preparing tablets of cotton cloth, rendered impervious to water by the aid of the gum of a tree, upon which records were written. Beautiful vases of terra cotta, minute trinkets from vegetable ivory, flowers of feathers and wax, adorned their tents and decorated their persons. Gold was wrought into exquisite workmanship—chains and rings in which were set emeralds and opals and pearls. All these evidences of taste and skill found a ready sale to the people of Palenqué. Groups of young men made their appearance, and danced their national dances in the hope of inducing the young maidens to come forth and join them. Then followed stately soldiers, exhibiting their feats of arms, at which the women soldiers, as by one impulse, detached a company to compete with them, and the women were found fully equal in courage, dexterity and rapidity of motion. At this the men applauded with enthusiasm. Wise men came to argue upon great subjects of polity, morals and religion. The views of Malinka and her people were so unlike all their own preconceived opinions, that a desperation seized them, and they retired, some with derision, some with disgust, and others impressed with profound doubt. Women sometimes came to see and hear, but a settled sneer gathered upon their faces, and they declared the whole camp ought to be destroyed, the women slaughtered, and their bones left to whiten the plain. This enraged the men of Penqué, who were secretly inflamed with a great admiration of the beauty and wisdom of this wonderful multitude, who contrasted so strongly with the idle, luxurious women of Palenqué. Meetings were held in which their opinions were discussed. Men were seen separating their boys from their girls, and training the former with great care, and superintending their education as they had never done before. Some might be seen putting them to bed, others bathing and dressing them, while at the same time they instilled moral ideas into their minds. Men began to direct their households as they had never done before, at which the women jeered, but were well pleased to get rid of care and labor. The men were bent upon

seeing how the thing would work. More than one impassioned speaker declared he "believed in the whole movement, and it would be a mercy if they also could get rid of the women, who were a plague and a torment; bent upon having their own will, and when this was denied them, ready to upset everything before them. He believed it would be better to have all their wives and sweethearts shut up in cities by themselves, where they would torment the men but for a brief space once in a year. If they can take care of themselves, let them do it. If they like this way of living, let them live it. We have spoonied too much, and they despise us. They'll quarrel and break up in good time; or if they keep on, as the Elders believe, so much the better. I, for one, wish the women of Palenqué would follow suit."

It was noticeable that the speakers in this way had wives of the irrepressible, soldier-kind.

From all that Malinka and the people could learn, there was great ferment in the City of Palenqué. The men, seeing a style of women preëminent in beauty, grace and accomplishment, disdaining bondage, devoted to high art as well as all industries, self-reliant, needing no support, bearing all their own burdens, thinking and acting for themselves, religious, orderly, tender and devoted, were half beside themselves at the view. This raised contention with their own women; and never was the city so discontented. Sometimes these latter, but for the men, would have sallied forth and with force of arms have driven the whole army of women into the wilderness, so true it is that women are the worst enemies of each other, and the two sexes depending upon each other will be in a state of perpetual altercation; hence, Quetzalcoatl had directed that each should bear its own burdens, or else one will shirk the weight upon the other. They are only helpful in quarreling, and peace will come upon earth when they cease to lean upon each other. Let no woman live under the roof of the man who calls her wife, said Quetzalcoatl, lest she domineer over him and clamor for his goods, and be jealous of his person; and in like manner let not the husband remain long in the house of his wife, lest he in like manner destroy her goods and become weak and unmanly. Let them live as they live in the courts above.

The Elders of Palenqué seeing the tumult but on the increase day by day, at length called a solemn

council to determine what to do. They had hardly seated themselves when all the women of Palenqué as if by one impulse thronged around the council board, demanding that the men of the city should issue forth and rout this army of women with all their new-fangled notions, and declaring with one voice that they believed them no better than they should be. Here was a dilemma. It was never known what would have been the result of the solemn council then and there convened, for the women broke it up and compelled them to do something more than talk. They must quell an insurrection at home, and repel an invasion from abroad. No time was to be lost.

The Elders were aghast at this tumultuous assemblage, but one of them started up and seizing his wife in his arms rushed down the stairs leading to the subterraneous passages of the great palace. He was instantly followed by others, who grasping each his wife followed in the same direction, so that few except young girls were left above the ground. This done, the men returned and seated themselves at the board to continue the council; but so great was the crowd of young men clamorous to do something, but not knowing what to do, that the Elders found themselves in a fearful predicament. There were the migrating women, saucy, handsome, intelligent; there were the domineering, foolish women, screaming and fighting in the vaults below. [A modern hand has here given his testimony in the hope that every one of them split her throat and died on the spot. The translator has many doubts whether many of them ever came up again to the light, being wholly in the power of men unaccustomed in that age to think a woman had any rights a man was bound to respect, though now in our age the tables are turned, and all agree that a man has no rights a woman is bound to respect. I do not find any further mention of these women.]

The Elders grew determined in look as they took into their minds the whole merits of the case. They saw that once having deliberated upon the claims of these women to their independency that they had in fact indorsed them. They should have driven them from the vicinity of Palenqué, unless disposed to accede to their requirements, for it needed little penetration to foresee what might be the result with other women of less intelligence and hotter tempers. Such would either rush in the same direction, expend themselves in

malicious hostility to the women, or make court to men by denouncing them, the women, as loose and indisposed to the natural affections pertaining to humanity. The Elders saw that they had now no resource but yield. They had unwittingly lost the field.

Then these grave, thoughtful men went forth, followed by a multitude wishing to see what would be done, and took their way to the camp of the women. Malinka, the Lady Tula and other leading matrons, escorted by a band of soldiers, went forth to meet, and demanded why such a vast concourse approached. Now it is the nature of men to yield all or nothing, while women ask little at first but keep on gradually increasing their demands, till they get not only all they at first sought, but a great deal more, even to the entire overthrow of those that contend against them, and the lifting of themselves above the ruins. Thus the Elders and chief men of Palenqué having listened to the conditions of polity by which the women bound themselves, argued point after point with great moderation as well as ability. One of the men made remark:

"I fear it will not be well with the boys. I fear we shall lose a great many fine children for lack of skill to manage them."

"This need not be," responded Malinka. "You will have so much less to do than in the old state of things, that you cannot fail to learn the wise care of your own sex in infancy; and these, unexposed to what you call the weak fondness of the mother, will reward your care by greater improvement, and the growth of a nobler manhood. You will inculcate the beauty and reasonableness of manly chastity, and fidelity, and honor in the relations of the sexes, a kind of morality which you have been slow to learn."

The Elders groaned in spirit. "Poor little babies! I fear it will go hard with them, for men are but rude nurses;" at which the soldiers tittered audibly.

"Remember," answered Malinka, "you will only have to adapt your laws to your own well-being, leaving us to rule ourselves by laws of our own making; you will earn property for yourselves alone, and make wars as you like, and fight all your battles in your own way. It may be, without us to arm you and incite you, the world will learn peace, through a lack of the fighting element intensified by the action of both sexes upon each other."

"Let us fight it out now, and subdue these women, so dangerous to the world," cried a martial youth, provoked at the jaunty manner of the women soldiery. At this the latter sprang forward with their battle-axes and spears in a most electrifying manner.

"Nay," groaned the Elders, "There is that in human movements that compels them onward. Men of Palenqué, ye have had a taste of new thought; the sight of a new order of women. Should we destroy them, which would be only by great shedding of blood, ye would be less content than even now. Ye would look back with regret, and a vain questioning as to what might have been. Should any be spared, no compulsion would bring them back to servility. We must do as best we can."

Every ear was intent to listen, every neck was stretched to its utmost that the owner might see as well as hear. The speaker continued:

"I offer to the women of Cholula the great Palace of Palenqué, in which they may live by themselves and carry out their own polity of government."

There was great shouting by the young men of Palenqué at this offer. It was evident also that it was not displeasing to the maidens from Cholula, who, while bent upon preserving their freedom, did not wish to be too far isolated from the other sex. They saw that the new system not only preserved the former, but would render every married man a perpetual lover. But Malinka was disinclined thereto. She doubted if the new could well be grafted upon the old manners of a people, with a mass of women to annoy and vex them, who might corrupt the husbands, and in a thousand ways undermine them and work injury to the enfranchised women. At length she dissolved the assembly, referring a decision to the following day.

Long and seriously did the women deliberate upon the proposal of the Palenquéans. The young moon walked onward in her starry pathway, and the solemn Cross looked from its space in the heavens a perpetual symbol of the sharp divergencies of our mortal life. At length all but the sentinels on duty were buried in sleep. The weary eyes of Malinka at length closed, and Quetzalcoatl appeared radiant in smiles, but bearing the form of the beautiful husband whom the Priests of Cholula had laid on the stone of sacrifice.

"Remain in Palenqué," he said. "They are

a gentle and teachable people. Remain, and teach them a knowledge of the Supreme God; teach them to cultivate the earth, teach them the worship which is found in a pure life, teach them the arts of peace, that wars may be no more."

In the morning the face of Malinka was of a celestial brightness. The words of Quetzalcoatl were like balsam to a wound. The presence of the Beloved was around her, and a cold destiny no longer shut her out from a grateful sympathy. Calling her people together, she went forth to meet the men of Palenqué, who were dazzled by the beauty of her countenance and the majesty of her aspect. Standing in her trailing white robes, with the symbol of the serpent upon whose crest was the figure of a dove encircling her head, and her long hair floating over her shoulders, she looked no other than the bride of the beautiful Quetzalcoatl. She spoke:

"Men of Palenqué, we accept your generous gift of the great Palace of your city; but further, that no strife arise between us, let there be a high wall and towers to divide the city into equal parts; and we will separate from you except at the yearly festival, when the youth of both sexes shall be married and betrothed."

It was wonderful the alacrity with which that dividing-wall was built up; the burning sun and the midnight stars bore witness to the zeal that inspired the workers. At length half of the city was evacuated, and amid the clashing of music, and the waving of banners, and the shouts of innumerable happy voices, the women marched in and occupied. Malinka stood upon the wall above the great entrance gate and saw the beautiful company file by, while the men almost buried the walls in the flowers they scattered in their pathway.

When all had entered she revealed to them the words of Quetzalcoatl. The people listened in profound silence while she repeated the will of the beneficent god, that they should till the earth, plant trees, and cultivate the arts of peace, for the good god was angry with his children for killing each other like unconsidered beasts of the field. Long and earnestly she spoke, while more dazlingly beautiful grew her calm, lovely face. The sun had gone to rest, and the moon and stars shone upon her head, as all the people bowed their faces, overcome with awe, and promising obedience. When they again looked up Malinka was no more to be seen. Ages passed away, and the beautiful Priestess was no more seen upon the earth.

## BIRD-LIFE.

By S. D. SNEVETS.

ANY ONE who will watch carefully may soon perceive that not only pigeons in the court-yard, sparrows on the roof, crows and magpies in the wood, and many other birds, always live together in inseparable pairs; but also that swallows and various other small birds, when, in the autumn,

THE PIGEON OF PALESTINE.

they fly about in great swarms previous to migrating, always keep together affectionately in pairs. Starlings, crows, and various others, collect together in the evenings in large numbers on bushes, high trees, and church roofs for a night's rest; but in the morning the company resolves itself into pairs, and during the entire time of flight these pairs remain together. Several species are the exceptions to this rule, inasmuch as the two sexes form into separate companies to prosecute their migratory flight; this is the case with most of our summer warblers. The male start, and also probably return, some days earlier than the females; but whenever the two sexes have returned, they mate, and the pairs then formed are supposed to be of the same individuals as in previous years.

The fidelity and affectionate intimacy of married bird-life appears most conspicuously in pairs of the Grosbeak family and in small parrots. Here is perfect harmony of will and deed. The two sweethearts appear unwilling to leave one another's

company for a moment all their life; they do everything together—eating and drinking, bathing and dressing of feathers, sleeping and waking. Various degrees of affection and harmony are discernible on close observation. Among the small grosbeaks, pairs of which sit together, the intimate relation is never disturbed; even over the feeding-cup there is no quarreling. They stand highest in this respect among birds. Love-tokens are exchanged by pressing of beaks together—a veritable kissing, accompanied with loving gestures. They are also more sociable, and even at nesting-time more peaceable than other birds. In the case of other grosbeaks, when the male bird sits by the female in the nest, there are various demonstrations of affection, but also slight occasional disputes, especially about feeding-time. Next in order come the small parrots, which also appear

THE PIGEON OF SYRIA.

almost inseparable. The male bird feeds his companion with seeds from the crop. This goes on quite regularly during the hatching, and until the young are somewhat grown. During all this time the hen-bird, which broods alone, never leaves the nest but for a few minutes, and the cock shows

THE DOVE.

such affectionate care, that the whole day he seems to do nothing but take food and give it again. Yet even this loving union is marred from time to time, even during the hatching-time, with quarrels that even come to blows. Again, the male bird of a pair of chaffinches only occasionally sits on the eggs or young, but he watches the nest very carefully, singing to his mate the while, accompanies the hen in flight, and helps her in feeding the young.

The marriage unions of parrots present great differences. The long-tailed Australian parrots, beautiful in plumage, but mentally inferior, are not nearly so affectionate towards each other as the little short-tailed species. M. Russ, a careful observer, tells us that the male bird of the Australian Nymph Cockatoo generally remains by night with the female, and during the day sits much more than she does. Such parental care is rare. Many parrots, especially large species, are by no means peaceable in their sexual relations, and appear somewhat affectionate only at the time of nidification. Large parrots are commonly very excited at brooding-time, and ferocious towards other animals, and even men. All parrots show affection by giving food out of the crop.

A quite peculiar wedlock is observable in some of the finches and other birds. "In my aviary," says M. Russ, "I had a pair of saffron finches, at

whose behavior I was for some time quite astonished. The cock and the hen hunted and persecuted each other savagely for days and weeks together; it was not, as in the case of some other birds, mere sport and teasing, but a bitter strife; the end of which was that the male bird, which appeared to have the worst of it, made his escape altogether, and never returned. Yet these two birds nestled, and actually reared four young, though I could not perceive whether their hatred was laid aside, or at least abated, during the hatching." Similar phenomena, though not so pronounced, occur amongst finches, parrots, birds of prey, etc.

We have already said that the grosbeaks express affection for one another. The male frequently also performs a dance before the object of his regard; he hops about in a droll courtesying manner, with outspread tail and nodding head, warbling at the same time a melodious ditty. The larger grosbeaks give forth peculiar sounds accompanied with a hopping movement. These love-dances are frequently to be noticed in bird-life; among the best known and most skillful in this respect are those of the black-cock, the love-making of which is exceedingly interesting to watch.

The strong pugnacity developed among birds at

THE CUCKOO.

THE HAWK.

time of hatching is remarkable. Even the little gentle grosbeak will endeavor, by violent pecking, to drive away males of the same or closely related species from the neighborhood of his loved one. The larger finches are often roused by the same zeal to a blind fury, which, in the case of the chaffinch, is frequently taken advantage of by the bird-catchers. The fights observed in nature between birds have most generally for their cause the emotions of love.

We come to another expression of affection in bird-life—namely, song. It is to a great extent of a purely emulative character, and not seldom is the contention so strong and persistent, that one of the two rivals, through over-exertion falls lifeless to the ground. One may observe such rivalry in spring, in the woods and fields, between two neighbouring male finches, nightingales, and various other birds. And in the aviary it is to be observed not only among the excellent singers, such as the gray finches and red cardinals, but also in the comparatively silent grosbeaks.

But the singing of birds has of course also another aspect—it is the most potent means of wooing. And this is true not only as regards the sweet plaint of the nightingale, the melodious warbling of the finch, but also of the hoarse croaking of the crows, the ear-splitting screech of the jay, the murmur of the pigeons, and the like—doubtless the most bewitching tones they are able

to produce. "Hark! the lark at heaven's gate sings;" so says Shakspeare. And for what does the lark ascend and trill his cheerful lay in mid-air but to sing in a spirit of kindness to his mate nestling on the ground within hearing of his notes; or as a versifier has pictured this delicate attention:

The lark on high now mounts the sky,  
All hear his pipe a-ringing;  
His mate on nest whom he loves best,  
Sits listening to his singing.

It can hardly be doubted that the response awakened in the heart of female birds in these circumstances is quite as genuinely tender as the notes addressed to them. The very birds of the air might teach a lesson to man—to the wretches who, in the bosom of civilization, kick wives to death, and leave their children to die under the accumulated miseries of want and desolation!

The cuckoo shown in our illustrations is frequently spoken of by ornithologists as a bird of peculiar habits. We read also in Lev. 11: 16 of Kuk-koo; and again, Deut. 14: 15, it is recorded as one of the birds of which the flesh was unclean. We do not think it at all probable that the same kind of bird is mentioned in the sacred writings that we exhibit. It was more likely some of the

THE BEE-EATER OF PALESTINE.

lesser kind of sea-fowl. Duns imagines that the bird in question might be the flamingo, which

THE RAVEN.

frequents the shores of the Red and Dead Seas. But a few years since the cuckoo was quite common in the rural districts, especially in Ohio and several of the Western States.

The dove belongs to the natural family of birds called *Columbidae*, comprising pigeons, doves and turtles. There is a peculiar sacredness connected with the habits and history of this species of feathered life. We find the dove mentioned in Gen. 8: 6-12 as Noah's chosen instrument for making known to him the state of the mighty waters of the flood. There are many allusions to it regarding its beauty of plumage. It symbolized innocence, meekness, purity and splendor of righteousness. In the East, doves are frequently domesticated. Morier speaks of the pigeon-houses as "large round towers, rather broader at the bottom than the top, crowned by conical spiracles through which the pigeons descend. Their interior resembles a honeycomb pierced with a thousand holes, each of which forms a snug retreat for a nest." Turtle-doves are invariably smaller than pigeons; they have generally a patch of colored feathers on the neck. A kind of black pigeon and also the turtle-dove were, alone of birds, offered in sacrifice; full-grown tur-

tle-doves in pairs, but only the young of pigeons (Lev. 1: 14). These offerings were generally of the poorer classes, hence made by the Virgin (Luke 2: 24). It is related that the Assyrians and Babylonians bore a dove on their standards in memorial of Semiramis, nourished by doves when exposed after her birth. There is such a quiet modesty exhibited in the habits of this bird, and which corresponds so well with its plumage, that it would almost seem to have been placed upon the earth to teach to man lessons of simplicity in attire, and meekness of disposition.

A bird of remarkable beauty is shown in connection with this article, known as the Bee-Eater of Palestine. Its feathers are of variegated colors and of a fine quality, its beak long, sharp and dark, the under portion of its neck white, with a black ribbon of plumage around

it. This bird lives principally upon insects, and the bee, especially, is its favorite game.

The hawk shown in our engraving is only one of a great variety. In the United States this bird is well known, particularly by children who reside in rural districts. The mother-hen and her children of the barnyard dread this thief of the air, and on its approach they startle all around them by their cry of alarm. The original word (hawk)

THE SPARROW.

implies swift motion, which is practically shown in the manner with which they swoop down and

THE HOOPOE.

carry off the little ones. The hawk, though not migratory in this country, is so in parts of Asia and Southern Europe. It is referred to in Job 39: 26. Dr. Thomson mentions a striking illustration of the passage: "I have often seen them *returning* South during the latter part of September, but never saw them migrating Northward. I can only account for this by supposing that in going they straggle along in single pairs, and at no particular time, or else by some distant interior route, but that when their young are grown they come back Southward in flocks; but even then they do not fly in groups, as do cranes, geese and storks, but

THE SPARROW OF EGYPT.

keep passing for days in straggling lines, like scattered ranks of a routed army. Here and there, as far as the eye can reach, they come flying every one apart, but all *going steadily to the South.*"

More than ordinary interest clusters around the history of that most voracious of birds, the raven, as it is frequently referred to as illustrating God's kind providence. See Job 38: 41; Ps. 147: 9. The raven is first mentioned in Scripture as Noah's choice of birds to send out from the ark, and to which it did not return (Gen. 8: 7). Under the Mosaic law, the raven was considered unclean. We have no positive proof, however, that the raven of Palestine is identical with our common

THE AMERICAN SWALLOW.

species; and the expression of the Mosaic prohibition, "every raven after his kind," would seem to signify that a class more than an individual species was meant. Raven, we are also told, supplied with food the prophet Elijah when he journeyed by the brook Cherith (I Kings 17: 4-6). This statement has been questioned and a number of hypotheses have been devised to weaken its force; but as Keil correctly observes, "whoever acknowledges the loving God will confide in his omnipotence that he can cause his servants to be nourished even by ravens."

The sparrow is one of the most favored of birds, inasmuch as it is a frequent visitor, and indeed it might well be said, makes its home along with the busy, bustling life of ours. Indeed, it would appear that the common sparrow is one of the necessary adjuncts of civilization, as it may be found near almost every town, and even in the

populous cities. There are more varieties and kindred species of this bird. In the Holy Land,

THE JAPANESE CHATTERER.

it is said, more than one hundred varieties are to be found. The sparrow mentioned in Ps. 102: 7, is described as a solitary bird, and is thought to be a species of the thrush. An eminent writer says: "They are a tame, troublesome and impertinent generation, and nestle just where you don't want them. They are extremely pertinacious in asserting their right of possession, and have not the least reverence for any place or thing. David alludes to these characteristics of the sparrow, where he complains that they had appropriated even the altars of God for their nests. Concerning himself, he says: 'I watch, and am as a sparrow upon the house-top.' When one of them has lost its mate, a matter of every-day occurrence, he will sit on the house-top alone and lament by the hour his sad bereavement. These birds are snared and caught in great numbers; but, as they are small and not much relished for food, five sparrows may still be sold for two farthings." Yet, notwithstanding the multitudes, the American people love the sparrow and toss to it, with pleasure, crumbs from the table, hoping thus to secure its return.

The reader is too familiar with the swallow to require any extended remarks. With our illustration, it will suffice us to say that this bird belongs to the *Hirundinidae*, an insectivorous family, in which the powers of flight are highly developed, while the feet are poorly adapted for progress on terra-firma. This bird is of a migratory disposition, especially in sections of the country or in latitudes where the supply of insect-food, taken on the wing, fails in the autumn.

The Japanese Chatterer belongs to what is known in this country as the jay-bird family. It is peculiarly distinguished for its vivacity. There is in the carriage of the bird a certain sort of animation which tells of gayety and pride not unlike human love of display. Its name reveals its nativity (Japan) and also its colloquial powers.

The Java Mino in appearance strongly resembles the raven, differing mainly in the crown on its head and the length of its beak. In habits it is rather staid, and not unlike the inhabitants of the island which gives it its name.

The limit of this article will not permit us to speak at greater length. It would be both pleasing and profitable to enter more fully into the life of the feathered family. With this, our short excursion among the children of the air, we have been delighted, and foster the hope that at some

THE JAVA MINO.

other time we may be able to make a longer and more instructive visit to the home of the warblers.

THE MORRISTOWN GHOST.<sup>1</sup>

By J. M. BEACH.

NESTLED among the hills of New Jersey is a place rendered historic in the annals of the Revolution. It was twice selected as the winter quarters of the American army. After the victories of Trenton and Princeton, Washington took a circuitous route through Middlesex and Somerset Counties, and rested his army at Morristown for the winter. The location was happily chosen. Only thirty miles distant from New York, he was enabled to observe the movements of the British troops in that city. His communication with Congress was unbroken, his means of retreat in an emergency secure; and a productive surrounding agricultural region furnished abundant supplies for his wearied troops. With these facilities he was enabled to do more than act on the defensive, and took possession of the Raritan River and coast of Staten Island. Here he held correspondence with many distinguished leaders of the Revolutionary cause and with Congress, and issued many important General Orders. In his second winter at Morristown, Washington was joined by his wife, who found leisure from this point to maintain friendly correspondence with patriotic citizens in Philadelphia and elsewhere. Many historic buildings still remain in good preservation in this vicinity, an account of which, with engravings thereof, will be found in the MONTHLY for September, 1875. Among them are the residence of William Alexander ("Lord Stirling"), the Ford Mansion, the Faesch Mansion, and others.

It is not our purpose now to do more than allude to the Revolutionary incidents of this beautiful locality. As our title indicates, we propose to give briefly a history of a popular delusion which spread through this region, and involved in financial ruin many of its residents. A narrative of the affair was published in 1826, by "David Young, Philom," well known to Jerseymen as the

celebrated almanac maker of Hanover. We prefer, however, to go to the original source for information, and for the main facts here given we are indebted to the publication mentioned above. A fac-simile of this pamphlet has recently been issued by the Messrs. Vogt of Morristown. The author wrote anonymously, and the edition was bought up and suppressed soon after its appearance.

The chief actor in this *spiritual* delusion was Ransford Rogers of Connecticut. He possessed little education, although a school-teacher by profession; but combined tact and affability to such an extent as to convey the idea of great abilities. Having made the acquaintance of two gentlemen of Morristown, he removed to that place, where he took charge of a common English school. An opinion prevailed that a large amount of gold and silver was deposited in the earth at Schooley's Mountain,<sup>2</sup> and that it was guarded by hobgoblins and apparitions. Rogers professed his ability to dispel these custodians of the supposed treasure, pretending to great knowledge in chemistry and the means necessary to secure the coveted prize. He secured an assistant, and in September, 1788, commenced his incantations and perfected his plans for extracting treasure, not from Schooley's Mountain, but from the pockets of his credulous patrons. He assured them that an immense amount of money was deposited in the Mountain; that several persons had been murdered and buried with it, in order to prevent its recovery, and that these spirits must be raised and conversed with as a preliminary step to its reclamation. Rogers professed to hold intercourse with these spirits. In order to impress his dupes with a conviction of his miraculous power, at the evening meetings for consultation several substances were thrown into the air, breaking in such manner as to convey the idea of supernatural power.

At one of these meetings a spirit appeared, and harangued them. They were directed to meet on

<sup>1</sup> An Account of the Beginning, Transactions and Discovery of Ransford Rogers, who deceived many by pretended Hobgoblins and Apparitions, and thereby extorted Money from their pockets. In the County of Morris and State of New Jersey, in the Year 1788. Printed for every Purchaser—1792.

<sup>2</sup> A celebrated watering-place, about twelve miles from Morristown. The mountain rises eleven hundred feet above the level of the sea. A spring at its top is impregnated with oxide of iron, lime, soda and magnesia.

a certain night in a secluded field; "they must form certain angles and circles, and they must proceed in drawing their circles as Rogers directed, and then be careful to keep within the circles, or they would provoke the spirits to that degree they would finally extirpate them from the place!"

Now commenced a series of mummeries so absurd as to excite our wonder that sane men could be deceived thereby. We will let our author describe them:

"The night appointed for them to convene having arrived, they all with joy, fear and trembling, convened at the appointed house, about half a mile from the field. This field was environed on the north and west by a thick wood. The circles and angles being drawn the preceding day, they all proceeded from the house about ten o'clock in the evening, with peculiar silence and decorum, and entered the circles with the greatest solemnity, and being fully sensible they were surrounded by apparitions and hobgoblins.

"Upon one part of the circle were erected four posts, in order to spread a cloth and form a tent, where Rogers could preside, as governor of the ghastly procession. The number that entered these circles was about forty. This number was walking alternately during the whole procession. It is not to be wondered at, if the people were timorous in this place; for the candles illumining one part of the circle, caused a ghastly, melancholy, direful gloom, towards the woods, for it was a dark night. Every person must suppose that this was a suitable place for the pretended ghosts to make their appearance and establish their faith in hobgoblins, apparitions, witchcraft and the devil.

"After they had been rotating within the circle for a considerable time with great decorum, they were instantaneously shocked with the most impetuous explosion from the earth at a small distance from them. This substance was previously compounded and secreted in that place a few hours before. The flames rising at a considerable height, illuminated the circumambient atmosphere, and presented many dreadful objects, from the supposed haunted grove, which was instantaneously involved in obscurity.

"Immediately after the pretended ghosts made their appearance, with a hideous groan. They remained together, but conversed with Rogers, in the hearing of the company—this was in November, 1788. The spirits informed them that

they had possessions of vast treasure, and could not give them up unless they proceed regularly, and without variance; and as fortune had discriminated them to receive the treasure, they must deliver to the spirits, every man, twelve pounds, for the money could not be given up by the spirits until that sum was given them. They must also acknowledge Rogers as their conductor, and adhere to his precepts; and as they knew all things, they would detect the man that attempted to defraud his neighbor. These pretended ghosts had a machine over their mouths, that caused such a variation in their voices that they were not discovered by any of the company during the procession, which lasted until about three o'clock in the morning.

"Now the whole company confide in Rogers and look to him for protection to defend them from the raging spirits; and after several ceremonies Rogers dispelled the apparitions, and they all returned from the field wondering at the miraculous things that happened, being fully persuaded of the existence of hobgoblins and apparitions. By this time they could revere Rogers, and thought him something more than man."

The result of these frequent interviews was the delivery to Rogers of a large sum of money to enable him to allay the "spirits" and recover the buried treasure. A sort of emulation arose as to who should most promptly obey the demand for material aid, and a large amount of gold and silver was cheerfully contributed.

In March, 1789, the contributors became clamorous for a speedy raid upon the auriferous Mountain, but were advised by the spirits to place implicit confidence in their chief, and obey him in all things. Confidence in Rogers was unshaken, and he might have framed satisfactory excuses for indefinite delay in the matter had he been content with the large sum already received by him. In the succeeding fall, however, he was joined by two young men of his acquaintance in a scheme to effect another organization at some distance from Morristown. Restricting his operations to a smaller number of persons, he succeeded in extracting large sums of money from his new sphere of operations. His mode of procedure was nearly the same as in the preceding case, with the addition of a large amount of religious cant:

"After they had all convened, the first manoeuvre was, both the deceiver and the deceived

unite in prayer upon their bended knees; then parading according to their age proceed rotating the room, as many times as there were persons in number; then parading round a table, each one drawing a sheet of paper from a quire and Rogers folding them, delivered to each man one; then they proceeding in order, a small distance from the house, and drawing a circle about twelve feet in diameter, they all stepped within it, unfolding their papers, extending them with one arm, fell with their faces to the earth, continuing in prayer with their eyes closed, that the spirit might enter within the circle, and write their directions upon the papers; then Rogers giving the word 'Amen!' prayer ended, each one folded his paper, rose, and marched into the house; then unfolding their papers, the writing appeared upon one of them, to the great astonishment of most of the company. The contents of the writing was, 'O faithful man! What more need I exhibit unto you! I am the spirit of a just man, sent from Heaven to declare these things unto you; and I can have no rest until I have delivered great possessions into your hands; but look to God; there is greater treasures in Heaven for you! O faithless men! Press forward in faith, and the prize is yours!'

"Previous to this Rogers pulverized some bones and had given it to the commander, declaring that it was the dust of their bodies, and each man must have some of the powder in a paper sealed, as a token of the spirits' approbation, and that he was one of the company. This powder was to be kept secret, and no one touch it upon his peril. . . . One of the aged members that had one of these papers, supposed to contain some of the dust of the body of the spirit, as I before mentioned, was to be kept secret and no one to touch it. This man leaving it accidentally in his pocket in the house, his wife happened to find it, broke it open and perceiving the contents, feared to touch it supposing it to be withcraft: She went immediately to the priest for advice—he, not knowing its composition was unwilling to touch it for fear it might have some operation upon him.

"When her husband discovered what she had done, he was much terrified, declaring she had ruined him forever, in breaking open that paper. This made her more solicitous to know the contents; and she declaring not to divulge anything, he told her the whole proceedings; she insisted on it they were serving the devil, and thought it her duty to put an end to such proceedings."

Thus the whole scheme was exploded; Rogers was arrested and imprisoned. Subsequently he was released on bail and fled from the vicinity.<sup>1</sup>

It seems marvelous that intelligent and practical men should be imposed upon by such a shallow device. The amount bagged by Rogers was large, and was drawn from a well-to-do class. Gold and silver was the only currency recognized by the "spirits," and to obtain this many sacrifices were made. Tradition tells us that many farmers sold their live stock in order to obtain the requisite funds. Our author attempts to account for the growth of this delusion by attributing a wide-spread belief in witches to the people of Morris County. He says:

"I was once in Morristown, and happened to be in conversation with some gentlemen, who had, as it were, the faith of assurance in witchcraft. They informed me that there were several young women who were bewitched; and they had been harassed so much by witches for a long time, and all their experiments proved abortive, and the young women were so much debilitated they were fearful they would never recover their health. They related several occurrences, that I think too simple to mention; but one instance was, 'That an old lady was churning, and being much fatigued and unable to obtain butter, she at last concluded that the witches were in the churn, and immediately had recourse to experiments, which were that of heating several horse-shoes, and putting them into the churn alternately—she burnt the devil out and immediately obtained butter.'

"I perceived that the generality were apprehensive of witches raiding them, and the greatest evidence of a witch was, if a woman had any deformity, or had lived to that age to cause wrinkles in her face, she had the appellation of a witch. There was another occurrence that happened on Sunday. They informed me a man was driving his sheep from his grain, and by an accident as they were jumping over a fence, one of the sheep broke his leg. The man for some time before supposed that the same sheep was bewitched.

<sup>1</sup> Rogers must have carried off his ill-gotten gains, for the following were all the assets that could be found after his escape: 1 calf, value 12s.; 1 cow, value £3 13s. 3d.; 1 small chest; 1 pair of silver shoe buckles; 1 silver watch; 1 pair of silver rims of buckles; 6 silver teaspoons; 1 silver buckle; 1 pair of sleeve buttons; 1 silver tea tongs; 1 shirt; 1 pair of nankeen breeches; 1 vest; 1 pair thread stockings; 2 slips; 2 pillow cases; and 23s. 6d. in cash.

About the same time, an aged old lady returning from church, her horse unfortunately stumbled and fell to the ground and broke her leg. This was received as an indication that she was a witch: And in fact, if a horse had the colic, or any beast was in agony of pain and behaved uncommon, the general opinion was, that the creature was bewitched."

We must not, however, judge too harshly those who, in that day, believed in witchcraft. The country had scarcely recovered from the effects of the Salem delusion, and a fallacy which had led astray the learned and pious Cotton Mather might easily have found lodgment in less cultivated minds. Even in this day a belief in the supernatural pervades the community, and the delusions of the last century have been supplemented by equally absurd beliefs in this.

The writer has had much acquaintance with the people referred to, and is inclined to reject the theory here advanced. A more plausible hypoth-

esis may be deduced from the statement that at the field meetings "a sufficient quantity of liquor was prepared, which the spirits had ordered to be used very freely; then each one taking a hearty dram, they all united in fervent prayer, after which the meeting was concluded." Those familiar with the effects of New Jersey whisky will readily believe that it contributed in no small degree to the raising up of "spirits."

The little hamlet where Washington quartered his troops has grown into a city. The fields over which the soldiers walked barefooted, and in which Rogers practiced his incantations, are covered with commodious mansions, and the "Morristown Ghost," by the magical power of the locomotive, is succeeded by the Bulls and Bears of Wall street. No treasure has been taken from Schooley's Mountain except the treasure of health gathered by the thousands who have frequented the charming spot and inhaled its life-giving breezes.

## SCIENCE AND REVELATION.

By ROBERT SEARS.

It is most unfortunate that science and religion should ever have been made to assume a hostile front. This has been productive of incalculable mischief, which has operated in two different directions. In the first place, it has too frequently led the friends and advocates of religion to display an unwarrantable jealousy of the progress of science, and to frown upon those who were engaged in the ardent prosecution of it. It would appear as if the imagination had been indulged, that every new conquest achieved by science involved the loss of a domain to religion—that every new pillar erected in the temple of science had been stolen from the temple of religion. This sort of groundless alarm might have suited the time when ignorance was esteemed the mother of devotion; and when undoubtedly it was the interest of the priesthood of a corrupt superstition that men should know as little and think as little as possible. But surely all such jealousy is unworthy of those who have an equally well-grounded

conviction that the works of nature and the volume of revelation proceeded from the same source. If this be the case, then, while science and religion may each have their appropriate domain within which their *dicta* are absolute, it can never happen that these will be contradictory. God has not written one language in the Bible, and a contradictory language on the face of creation. Revelation and science may not always speak the same truths, but they will never speak opposite truths. The danger lies in a kind of twilight understanding of either. It is not only possible, but likely, that an imperfect knowledge of the Scriptures, on the one hand, and an imperfect knowledge of science on the other, may land us in irreconcilable difficulties, which can only be cleared away by a more complete understanding of both. But this, so far from leading us to be jealous of the advances of science, should lead us to encourage and stimulate them to the utmost. While it is not only justifiable, but right, that we should regard with

suspicion any conclusion of science which seems subversive of the truths of the Bible, it would be at once irrational and sinful to attempt to stop its progress. Perhaps the conclusion may be a wrong one, deduced from a superficial acquaintance with science, which, if farther prosecuted, would lead to its abandonment. Perhaps the contrariety between science and revelation is only apparent, and results from our hasty and erroneous interpretation of the Bible. Take, for example, the well-known case of Galileo. He became convinced as he prosecuted the study of astronomy, that it was not the sun which revolved round the earth, as was universally believed at that time, but that the earth revolved round the sun. Alarm was taken at this conclusion, as if it expressly contradicted the language of the Bible, which speaks of the sun as rising and going down, and Galileo was subjected to persecution as an infidel. What then was the result? The science of Galileo has been established beyond the power of contradiction; but the Bible has not therefore been found to speak the language of falsehood. His discovery has only led to a sounder interpretation of those texts which the science of astronomy was thought to contradict. And this must be the issue of all seeming contradictions between revelation and science. It may happen that science now, as in the days of Galileo, may subvert some of our views of Scripture language; but, if so, we ought

rather to rejoice that science has aided us to a sounder and more correct interpretation of the Bible than we had hitherto attained. Here, then, are two errors to be guarded against, which we shall take time merely to notice. The first is the tendency to bend the facts of science to meet our views of revelation. No attempt could be more mischievous than this. When we are engaged in examining the properties and relations of matter, let us receive the facts it gives us without equivocation and without reserve—let us listen to the voice we evoke, as if there was not another in the universe. When we set ourselves to study nature, let us become the faithful and humble interpreters of nature. The second error is, the tendency hastily to adapt the language of Scripture to the inferences of science. This tendency is no less mischievous than the other, and has led in some instances to an utter subversion of all religious truth. When we are engaged in the study of the Bible, let us deal by it as we would by science itself. Let us hear what it says without reserve, and listen to its voice as the voice of God. Our part is to act as its faithful and humble interpreters, and to subject it only to such questionary processes as we would adopt with any other record, the real meaning of which we were anxious to ascertain. By acting thus honestly both with science and religion, it will be found that they speak a language always harmonious, because always true.

### A CLASSIC MYSTERY.

BY ROBERT L. BANGS.

IN Greece, where foam-born Venus dwelt,  
Three Sisters held their fabled sway,  
At whose fair shrine brave heroes knelt—  
At least so Grecian legends say.

These maids were not like modern belles,  
Such as you see in fashion's halls,  
Sometimes the toast of modern swells,  
Sometimes adorning parlor walls.

They were the Graces—women fair,  
Much raved about, but never seen;  
Ideal conceptions—things of air,  
Like Venus, their immortal queen.

It was a wondrous stroke of wit,  
Or rather inspiration, say—

At least it was a brilliant hit—  
To choose the Graces just that way.

To woman rather than to man,  
The gods all heavenly graces lent;  
So only woman ever can  
All graces fitly represent.

O, ancient Greeks, in realms above,  
Or with infernal gods below,  
Get leave of absence from great Jove,  
And one deep secret let me know.

You made the Graces women fair:  
No doubt it was the thing to do;  
Why, under heaven, I pray declare,  
Make raging Furies women too?

## THE FAIR PATRIOT OF THE REVOLUTION.

BY DAVID MURDOCH.

CHAPTER XXXVI. THE ELDER ABIEL'S STORY  
CONTINUED.

"Newabina, considering the battle over, ran immediately to Castilberg, where the old king, Etau-o-quam, was lying ready for his son, and looking forward to the hunting-grounds of his fathers. He found him content. The fierce Mohawk, his only rival, had been beaten back; and now, contrary to his expressed wish of the previous day, he commanded that his regalia, regarded by him with so much pride, should be taken off from him, and his son put into the kingship, while his eyes were yet clear to behold him. Over forty years had he worn it. From the time he had received it in London from the Great Queen over the big waters, he had worn it on all festive occasions, whether in war or in peace. He made Newabina kneel at his couch; putting his withered hand across his brow thrice, he took the feathery crown and put it on the head of the elected king, giving him at the same time the silver-mounted tomahawk: the symbols of power to rule, and of power to execute. Bidding him walk three times before him through the tent, he called him once more near, when he muttered something like an invocation; then, laying himself back, he never spoke more. On the same evening, just as the sun was bidding the world adieu, the mountains and the sky resplendent with the radiance of his beams, they laid the old chief in his last bed at the foot of that hill. Any one will tell you, should you venture there, where the Indians' graves are made. From that Castilberg his grave is seen with this mountain stream placidly winding round it: the Hau-pee-naus lies to the south a little way; while the great river over which he reigned so long, still winds on with majestic flow. I have stood on that rising ground at sunset, looking to the mountains above, on which there lay palaces, castles, islands, and smooth blue lakes, of spiritual beauty; and have at times envied the men who imagined those glories to be the grounds and the streams to which Etau-o-quam had gone, the last king of the rivers.

"Newabina, dressed in the royal attire of his sire, came down among his people, who received

him with shouts, for they deemed that his crown was fairly won; but the chief, the moment he stood on the Hau-pee-naus and looked out upon the water, perceived that his new honor was not to be retained without a struggle. The crafty Mohawk had a plan from the first, which he intended to put in force, but which he kept to himself. In the meantime he was seen strengthening his camp on one of those small fields where the Mohicans had from time immemorial raised the fragrant tobacco weed. He affected no secrecy of his intention to remain and watch his chance for another onslaught; and though he saw his enemy on the east shore and on the west side reconnoitering his camp, he made no attempt at driving them away. As night came on, the death song for the fallen braves rang out over the waters, and was echoed from the shores, sometimes in low, plaintive tones, and at intervals with wild shrieks, which made the blood curdle in the veins of those of us who were listening upon Overpaugh's kekute; that, you see, as I said already, smoking there at this moment.

"But from that we went down to the high land that overlooks the river, where a band of us stood at night. The two islands seemed in the dark like two terrible creatures glaring upon each other with their thousand eyes; as if looking into the hearts they wished to penetrate. Yells of defiance went forth amidst the songs of lamentation, while from Castilberg was heard a more mournful sound, as the women shrieked over the grave of the departed sachem. We were becoming every hour more numerous, and had formed ourselves into a band of defence in case of any murderous attack from the Mohawks, should they prove victorious. Their blood up, any scalp would become valuable. We chose Du Bois as our captain, and were drilling under his command, while we were marking the movements of both parties below on the two islands.

"All night the spies of both sides were busy around. Fearlessly did they venture within the rival camps; crawling like snakes along the ground, after rising on the banks as otters lift their backs, letting the water drip from their sides; when, after having obtained all they wanted, creeping back,

they would dash into the stream with as loud a plunge as they could make, giving a laugh of triumph as they swam into the current; or of contempt at the negligence of their foes. One of these daring devils was caught on the shallows, and though he fought like a panther, now holding on as with a grip of steel, and then slipping out of their hands as an eel escapes, he was finally conquered, and condemned upon the spot to a cruel death. By some mutual sign of their own, the Mohawks were made aware of the fate of their brave spy; for, standing abreast on the banks of their own island, they saw the fire kindling that was intended for his torture. It was on a little knoll upon the verge of the creek, which could be seen from all the camps: from Castilberg, Happee-naus, Wantona, Ussaman, and our hill we saw the tragedy, and heard the shouts of cruel victory that rang around us from the Mohicans; while the companions of the wretched victim sang his death song aloud and clear, so that his spirit entered the halls of his fathers by the music that he had loved best all his life.

"This last occurrence inspirited the followers of Newabina so highly, that he resolved to attack the Mohawks instead of waiting for Hendrick on the next day. He kept his counsel to himself till the last moment, confiding only in his pale-faced friend Du Bois, who endeavored to dissuade him from it by every argument he could bring.

"The attack was what Hendrick anticipated. He kept his fires burning, tied his blankets to the trees, spreading them so as to surround his camp, and making the whole outside to have the appearance of a secure and comfortable sleeping ground. He seemed careless; letting the spies of his enemy come as near as they pleased, so that they might bear away reports of the state of things as they appeared from the outside. Newabina made a voyage himself to the islands, so as to make all sure, and came back satisfied that the Mohawks had gone to sleep.

"We all stood upon the hill, ignorant of what was to happen next; only that we were warned by Du Bois against disbanding for the night. We were all hunters, and ready to fight for our hearthstones, with as good heart as we ever hunted a hungry wolf. Quietly we sat on the hills saying little; the peddler in our midst talking as if he did all the work. He dilated on the causes and the consequence of this battle, with the same assurance as he would have discussed a yard of serge.

"These Mohawks are a wicked set, and will just do whatever Colonel Johnson tells them to. If he has bid them kill off the white folks here, be sure of their doing it."

"Why should Colonel Jansen do dat ting?" said one old farmer, of more benevolence than knowledge of the world.

"Just that he may rule the colonies," was the peddler's answer; "and Parson Wheelock says that all men should make laws for themselves. That kings were made for the people, and not the people for the kings. That's no treason. Johnson is the critter of King George, and Hendrick is the critter of Johnson."

"Ende vay is de Mohican de creature of?" said the old Boerman.

"Why," said the peddler, "everybody in Connecticut knows that the old Sachem was on the side of the people, and we expect that the young capt'n will cast his braves into the scales against the crew that want to rule the colonies. What do you say to that, Mister Du Bois?"

"The person addressed had disappeared from our company, and was in close counsel with Newabina. 'Hendrick has one eye open. He sees the otter in the rivers. The muskrat will dart upon him in the dark,' was the warning of the Dutchman.

"The Elk is afraid of the water after the sun is down," said the Indian to his careful counsellor, with some bitterness in his speech, and as if reproachfully.

"Du Bois felt hurt, and replied, 'I have no fear of doing what I promised; but the pale-face has his eyes without blood, and can see clear. Can the brave chief see now?' and with that he threw a bandana silk handkerchief over the red man's face. Taking it off, he said, 'we will meet on the island, as I said.'

"This referred to a diversion which some of the boldest of us intended to make in behalf of their neighbors, the Mohicans, at the upper end of the island, when the fight would be at the hottest, just sufficient to alarm the Mohawks, and give their enemies a better chance. 'I have seen,' said our captain to us, 'that a sudden start was better than a deliberate volley.'

"Hendrick did sleep with one eye open, for he knew all that was going on. His spies were intelligent and penetrated the design of their enemy in time to warn him of their approach. Crawling out of his camp, he and his braves lay among the

bushes outside, scarcely breathing, with their weapons ready. Newabina came on, quietly at every step, till within a few yards of the place, when they rushed, yelling their war whoop, striking through the screen upon the ground where they supposed the Mohawks lay. Not a sound met their ear, but a silence which stunned them more than if a thousand voices had responded, since they expected such a meeting. As with one consent they ceased themselves, looking round for an enemy, when all at once the hidden foes started up, firing and hurling their weapons so truly from the dark where they stood, upon those within the fence, whose faces were plainly seen in the light that blazed; so that every shot and stroke told fearfully, bringing down a Mohican.

"Hendrick saw that now was his time, and springing from his hiding-place, he hurled his heavy weapon of war in the direction of his foe, so that it sank into his left shoulder. A moment more and the Mohican confronted him. The tomahawk of Newabina whizzed through the air, but it was a random blow, and missed its aim. His eyes were filled with the light of the fire, and could not discern objects in the dark around them. It was the same with the whole of that devoted band. They were shot down like deer, that come to the waters in the night. When they came out they could not see where to run.

"The two chiefs stood facing each other. The Mohawk had a sound body but it was old and stiff. The Mohican had the advantage in years, but now he was disabled, so that they might be called equal. They measured each other with the look of fierce revenge. Knife in hand, they were about rushing at one another, when the party under Du Bois landed, causing great alarm to the Mohawks, who were wholly in the dark concerning the new enemies, their numbers, or their plans; only they felt certain it could be no friends of theirs. We had no other wish but to prevent further effusion of blood, and had loaded with blank cartridge; but our volley told sufficiently to produce the greatest confusion. The preserving of their boats was their first care; and these little Abraham immediately put out into the river, where he waited for the fugitives, who, leaping in their terror into the water, swam toward the fleet, upsetting some of the canoes in their haste. By this time the Mohicans were recovering from their fright having discovered their new

strength, and were returning in great force and spirit, when there was no foe to encounter. One after another of the Mohawks had retreated through the bushes, and all being aware of the place where their fleet was moored, had run in that direction. Some of them, however, missed their way, swimming to the different shores, and either made their escape by running homeward or hid in the brakes, till they found a chance. One poor wretch was taken a few miles on his way and brought back to suffer all the cruelty which a red man can inflict so skillfully. Though I saw it, I have no wish to describe it. An Indian is a fiend when he becomes an enemy.

"Hendrick, taken equally with surprise, hesitated to venture upon Newabina sufficiently long to allow his foe to spring forward on him, but he met his match in that large and strong warrior. They clasped one another so firmly that their weapons were harmless. Rolling over one another it was difficult to guess which would have proved victorious. One that knew them both would have decided for the Mohican, but since his wound he had lost blood, and was becoming all the time weaker. One turn more in this state and his right arm fell helpless by his side. His time had seemingly come, for his enemy was above him. The knife was at his neck, when Du Bois sprang forward and arrested the hand. Hendrick rose to his feet as if to meet a new foe, when Drake, with a comical air, called out, 'I arrest you in the name of King George for disturbing the peace of this Province.' The Mohawk scowled one of his black frowns; and seeing Newabina helpless, he turned and took to the canoe that waited for him, and left the field, in which he had gained few laurels, though he had succeeded in rendering his way to the kingship certain to himself and to his successors.

"The young king of the rivers was buried in the same robe in which his father had arrayed him. They took nothing off from him. He reigned but a single day; and that was the last of that noble race who wore a crown."

The Elder Abiel having finished his narrative, turned to see the preparations for the hunting of the fugitives, and perceived that all was ready. A small party were to remain keeping sentry over the prisoners already collected, himself with the rest. He sighed as he gazed back upon the plain below.

Brandt, well pleased with the history given of his ancestor, smiled as he said:

"Big Boerman's tongue straight as a hawk's bill; goes to many sides, but picks the real bird from the branch it was pointed to at the first."

Clifford saw that the Mohawk aimed at the islands and would continue in sight of them while he had hope of gaining a footing there. He felt satisfied with his little plot of having the history of Hendrick told over by a white man. The pride of Brandt was excited, and so was that of all the Mohawks present. At any moment they would have descended at once, sparing none in their effort at maintaining the name and the fame of their nation. Their chief brought the whole band around him, making one of those nervous speeches to them, pointing down to the river, which at the close was followed by a war song and a dance that made the blood of even the tamest white man there tingle with emotion. A word of Brandt's, and death to all.

The band of men formed round into a solid circle, having the chief in the centre, then untwined itself by two threads that went off at almost opposite points, turning gradually westward.

#### CHAPTER XXXVII. A HUMAN WHIRLPOOL.

TEUNIS rose that morning, and without bidding any one good-by, went directly in search of Clarence Clinton, whom he left to sleep in the bear's den. Surprised and alarmed at finding the cave empty, he made the best of his way to the point of meeting with the other two young men at the Kaaterskill Falls. His knowledge of the route soon brought him to the place of rendezvous, but he saw nothing of them. When he arrived at the falls where he had left Bertram and Gabriel, he had lost all hope of finding Clarence. Bertram was clear for going at once and claiming the protection of Brandt, and to this Teunis was acceding, when Gabriel, more cool by nature, and less interested in feeling, threw in objections which caused the other two to hesitate. As captain, elected by themselves, he had the right to command, and he was worthy of the place.

"You cannot," he said, "think calmly on this subject. Were Peggy Troumpier where any of your joes is, my mind would not be in a fit state for planning, whatever it might be for fighting in the right time."

Bertram as well as Gabriel, had been putting on their Indian garments, found by them when they awakened that morning. Some friend was watching over them in the dark, and this gave them all three fresh courage. Beside the tree where these were laid, lay a paper containing something which Bertram soon discovered to be in Latin, but which he would have preferred much more more if it had been in common English.

"This fairy, or brownie, as the Scotch would call their good friends, surely thought we must have dictionaries on trees when he left this for us. Here it is: '*Media autem die clamor factus est: Ecce sponsus venit: excite in occursem ejus.*' "And at midday there was a cry made 'behold the bridegroom cometh: go ye forth to meet him.'"

"Is that a correct translation, you Bible-reading men?" said Gabriel.

"All but one word, I should think," said Teunis, who perceived the meaning of all this; guessing from what he saw through the night where these things came from. "You have put the word *mid-day* in for *midnight*."

"Let me see," said the lieutenant: "it is mid-day here underlined, and is intended to be so. Let us note this. Let noon be our countersign and look out for the midday."

After hearing a full report from Teunis, they made up their minds to remain at the place where they were, as the most likely to serve their purpose. If the marauders succeeded in recapturing Margaret, they would bring their victim here, as the first place of gathering; so the three took positions where they would see, and be themselves hidden. The solitude, to minds like theirs under the most painful suspense, was as much as they could bear. The ever-running water below, and the constant fall from above, affecting the two senses, hearing and sight, with the same monotonous din; and the same succession of airy spirits coming constantly through the narrow passage, and then leaping over into the cloud formed by their predecessors, produced a strange loneliness in their watching. And yet as no man feels himself alone if a child be playing around him, so these men when they saw that playful stream tripping down to the brink, and then stepping off with ease, felt that they had communion with the spirit of the region. Thrown back into the recesses of their own nature, they fell into that dreamy reverie

which the soul of the thoughtful loves to cherish at times, and with profit.

"This is more than I bargained for," was the expression of Bertram, "when I left the good ship Vulture. I expected to see a wild country along the shores of the river, but not to see nature in her wildest dress. I wonder if that Elsie, whom you describe as possessed of such good sense, Mr. Teunis, would have romance enough in her soul to take Miss Clinton to see this precious gem of these mountains."

"Miss Clinton," said Gabriel, "by the time she got this length, would have something else to think of. If she be a woman like the rest of them, streams of water fell over her cheeks."

"You are likely speaking the truth, so far, my captain, but there are some souls which never lose their sense of the beautiful and the grand, and Margaret Clinton is one of that kind: were she on the way to eternal exile, that silvery gossamer would, at least for a moment, relieve her painful feelings."

"Maybe," said the plain matter-of-fact Gabriel. "First impressions are always the most effective, and I own that my lady Margaret is the very one to see wonders, where I would not see aught but common things. I have been here when I felt the influence of the scene more than at present."

"Still, captain, you cannot help admiring the grandeur of the whole amphitheatre, as your eye ranges round in search of some single object on which to rest till you fix it on that watery spirit which springs from the shelving platform into the capacious hall beneath. Indeed, when I look again, I can imagine so many winged spirits sent forth from the Father of Spirits, meeting again below, as in airy sport; first in that dark mysterious gulf, from which they recoil as from a place of punishment, to rise where the sunbeams light upon them, forming the whole into a glorious crown fit for the heads of seraphim."

"You forget the possibility of Miss Clinton being hidden in that place down there, which you would compare to the mouth of the pit."

"I have imagined that to be possible," said Bertram, "and I am sailor enough to descend into the hold, or into the sea itself, for pearls such as she."

"That language is too deep, and too high for a common Dutchman like you, captain. Perhaps Teunis, who I see is in a brown study, may

answer you according to that kind of folly; but I will tell you what I once saw here. It was in the winter. A fine hunting morning, the snow all crusted over, so that it could bear man or beast. A little flurry had fallen during the night; just enough for the fox to leave his mark behind him. We had a hard run, but we earthed him, near the foot of the hill over there. As the work for that day was over, and we were on the lookout for anything in which we might pass the time, we followed the advice of old Frederick Saxe, the bear-hunter, and went down to see the falls frozen. This produced much sport with the young folks, who were inclined to poke fun at the old hunter. But knowing him to be a man of original expressions, I led the way that we might see a wonder. We came up from that deep gully below there, and arrived suddenly upon the sight of an object before which we all stood for a few minutes speechless, quite at a loss to understand its nature. They had all but myself been here before, and exclaimed, 'what is that? It has grown since I was here in the summer.' It was a high tower reaching from the bottom, up to the tip of that rock you see jutting out there, pure white, intermingled with glittering crystals. The stillness of the grave was around us. Some one whispered in my ear, 'the year is dead and that is its monument, raised by the frost king.' Imagine just now that not a sound is reaching your ear—all that din stopped, and the murmuring altogether lulled, so that you could hear the beating of your heart against your ribs."

"You don't mean to say," was Bertram's interested interruption, "that the stream was all gone? That might be in the summer, but the winter's freezing does not dry up the whole."

"No," continued the other, "the water ran as before, up there; but was neither seen nor heard after it left the ledge."

"That's a very droll story you tell, Mr. Captain, and may be good enough for the marines; but an old salt as I am, has spun too many yarns to believe that the water would not fall in the winter as it does at this moment, making din enough to deafen the old or young bear-hunter."

"Wait till you hear the whole. Suppose that from the place we are sitting, over to the other side of that amphitheatre, as you call it, a round thick tower were built of glass, hollow in the centre, rising up and up, till it came to that shelf

from which the water now runs ; where would the drops go ?”

“Why, through the glass tower, of course,” was Bertram’s quick expression ; “but what has your comparison to do with your description ?”

“Everything, Mr. Lieutenant, for there would be no murmuring sound of water as there is now ; nor thundering roar as I have heard after a heavy storm when that stream, so small and so tame, sprung like an angry beast till it cleared the whole platform, and fell into the outer basin yonder, two hundred and twenty feet.”

“Yes, captain, but your enthusiasm has made you forget your glass tower, which, as you describe, must have been a large bottle, bottomless ; taking in the whole stream at the neck, and letting it run down its sides, so that it passed through below.”

“Just so, and better told than I could tell it. It was full eighty feet in diameter at the base, and one hundred and eighty feet high, pure as snow, till it rose to the neck, when it became clear as rock crystal with the whole stream entering and passing through it, plainly to the observer.”

“Certainly, that was a wonderful object, and equal to any of the peaks of frost that I have ever seen or heard of. Does it rise so every winter ?”

“No, sir ; old Fred said that he had hunted among the hills forty years, and had seen it only complete once before. A half bottle may be frequently seen, like what comes after a drunken frolic, but the perfect full-blown vessel, out of nature’s glass-house, comes but once in a lifetime.”

“I hope you had something warm to drink, captain, for cold water coming through a bottle of frost may be good in a hot summer day, but in the months of February and March it is another thing.”

“We had plenty of the hot stuff, sir ; and it was dearly paid for too, with broken heads and bones nearly cracked. A little more and I would not be here to tell the tale.”

“Let us hear that yarn with the rest, for after what you have told I am ready to believe anything.”

“As you please,” said Gabriel, with perfect *nonchalance*. “After we had freely drank of Santa Cruz rum, our brains began to swim, and some of us did not know whether we stood upon our heads or our heels. I was ready for anything, either to scale the tower from below, or slide down from above. They laughed” till my pride was

touched, and through recklessness I began to climb. The rough sides of the gigantic thing allowed me a footing, so that I did get upon one of the turrets, twenty feet from ground, where I stood looking round me. The sight had not lost anything from my strange position. All round under these rocks were huge pillars of ice, formed by the water which had searched through between the seams.”

“I have seen the like,” interrupted Bertram, “in salt mines and in deep caverns, where stalagmites, built in the course of ages, rise to the high roofs as if chiselled by the hand of art. Go on, captain ; I beg pardon.”

“No, sir, thank you, I wanted just such a description to help me through. At the same time I stood there, it appeared more like a crystal theatre of display, and I have since frequently wished that lights of a sufficient size and number could have been introduced for the sake of showing the effect of illumination in such a place.”

“Oh, you must read when you can,” said Bertram, who could not restrain his speech to the end of the description, “the account of the Empress of Russia’s ice palace. You will see that the thing you wish has been tried with full success, lately, and after you have got through with that, turn to the ‘Arabian Nights,’ and you will see the power of Aladdin’s lamp.”

“Well, sir, there I stood on the turret, admiring my own daring as much as the wonders around me, when Jim Crapsar, that imp of Satan, thoughtlessly cried out, ‘Three cheers for Gabe.’ The three cheers were never given ; one was enough. Such a commotion has never been listened to by me, though I have been where a few cannons were let off at my ear, as you know. It seemed as if that single cheer would never stop. Crack, crack, crack, went off the pillars, all round falling in pieces as big as a cannon, and others like the trunk of a tree ; as to the small lumps they were like a shower of grape-shot mixed with forty-pounders. It sounded and appeared more like the last day than any battle I have been in. A company of more terrified beings I have never looked at in actual danger, with no way of retreat. It was begun in sport, but it closed in real earnest. As for myself I was really in the safest place, being in the centre looking on the shower and its consequences. But to this day I feel the shaking of that mass beneath me. If the three cheers had been given, down the whole fabric would have

come, and I, below the fragments, would have been crushed."

"That indeed would have been a tale worth telling at a hunter's fireside forever after; buried in an avalanche, and swept away by the stream, when the spring flood came. Not quite the equal to the Alpine traveller who is lying now in just such a glen as this; nor will he be found till the last great fire thaws him out. Anything more, Gabriel, about that wonderful bottle? one glass more, if you please."

"We left in double quick time, for a look at the bottle from above. It lost nothing in effect, but it was of another character. I have looked down since, but mostly when the sun shone bright in June. The day I refer to in winter showed the different colors of the rainbow reflected. It was in reality, a frozen rainbow."

"Ha! better than before, captain! Do you not see one now, giving us the promise of a fortunate day?"

"When the sun shines out that will follow of course, and you may go there to that step, and have it round your head if you choose such an ornament. There are more wonders here amidst the Kaatsbergs, than the king knows of."

"True, Captain Gabriel, the king has not a bottle in all his cellar like that which you held in your arms; and that is one reason why his Majesty wishes to keep this fine country of yours among his other treasures."

Teunis, somewhat piqued at the merriment of the young Englishman, turned to him, saying: "The half of the wonders of this spot has not been told you. Come here in the heat of summer, and after a fall of rain, you will, if you look up from below, see an entire rainbow—a complete circle; and though you laugh, I will tell it, that I have seen my face as distinctly in the centre as I have ever seen it in the round looking-glass that Madam Dyce has in her biggest west room. What do you say to that, sir?"

"I say his Majesty has not such a mirror in Windsor Castle, and it is doubtful if he has it anywhere in his dominions but here. I do not question what you say you have seen; but I would require Sir Isaac Newton to explain the philosophy of it; and yet, when I remember the camera obscura, I dare not doubt, though I must laugh a little at both you colonists, holding up the beauties of your country."

"Well, laugh away, but I have stood hours look-

ing up into that wonderful glass, where sometimes I would see a single face, sometimes one other; then as the sun would shine out differently through clouds, there would be faces all around the circle, changing their position every moment like a mystic wheel revolving, till the head below grew so dizzy that I have believed them to be faces looking down upon me from the upper world, only they were not always of the most pleasant kind."

"Ah, this is the spot," said Gabriel, "I have heard of when I was a lad, where they went to speak to the vapory spook, and get their fortunes told; I wish I had come before now."

"Gabriel," continued Teunis, "this is no laughing matter; I have known some who laughed after they came, on the wrong side of their face."

"Hush! hush! low down," said Teunis, as he prostrated himself to the ground, "there are runners afoot, I hear their voices calling to one another in the woods, and around us."

The three young men fell to the earth with their head toward the gorge; nor did they lie long in that position till they discovered persons on the opposite side descending into the bottom of the gulf. There were several; some of these were in the garb of Indians, others were dressed in the common woolen cloth worn in that region, dyed with the juice of the butternut, resembling brick-dust, as much as anything known out of Jersey. They increased rapidly in numbers as the circle grew smaller, according to appointment.

"Those persons in front are not real Indians," said Teunis, "I know from their looking so much before them, as if they were curiously investigating a piece of art. I warrant the real Mohawk sees more than they do, out of the side of his face and from under his eyebrows."

"And I would take those in front to be entire strangers, they look so astonished," was the remark of Gabriel. "I did not expect to see any but the real hunters up here."

All this time Bertram was examining the different arrivals with his pocket glass, and had the range of the party in front. Something in the outline of one of them awakened a dormant feeling in his soul, which made him keep that figure close in view, till at last he cried out, "Clarence! by George, as I am a living man!" and he was about to rise and halloo, when the man on each side of him held him down, pointing to the numbers which were coming in from the same side on which they lay watching.

"Take the glass and see," as he put the instrument into the hand of the captain.

A long, earnest gaze, and Gabriel agreed that it resembled Clarence much in manner, but the dresses were all so much alike, it was impossible to distinguish them individually.

"But turn your attention to what chiefly concerns you both; do you see any females among them? Look into every knot of persons, and watch all new comers."

"Yes," said Teunis, "for if there be none with them, it is time we were off to the next rendezvous, the pool that I told you of, and which we must reach by noon. Behold at midday!"

"You think that the cry is to come in that quarter, then?" was the sly question of Gabriel, who, being less interested in his feelings was the more inclined to jest a little with his companions. "Let us take matters coolly for the present, and mark the motions of our friends below. See how they pour down like so many bloodhounds to the death. Their hunt has made them eager for more prey."

The wide hollow now seemed alive with the crowd. At that distance it was impossible to distinguish the parties, they were so much alike. Some sat on the rocks, others hung on the side by branches and roots of trees, while a few of the madcap race were chasing one another under the shelving platform, and attempting to climb up the sides of the steep rock to the danger of their necks. A main body was grouped into a circle, who stood as if waiting for orders. Apart from these, and in deep conversation, were about twenty individuals, whom Gabriel declared must be the commanders of the expedition, engaged in counsel. He continued:

"What a difference between that little spot at this moment and what it was when we rose this morning! Then God and nature reigned, now devils incarnate are before us."

"Yes," said Bertram, "could we only see your tower of ice there in the centre, and boiling lava round it, and these fiends lying rolling naked in the pit, tumbling from the cold tower into the hot furnace, and"—

"Please to stop, sir; that's more than my nerves can stand; it puts me in mind of our Dominic's description of the bottomless pit."

"Another, as great as your great man the Dominic, has helped me to that description. While you were telling me of those cheerings which shook

icicles on you in showers, I was reminded of how an Italian poet describes hell, where 'naked spirits lay down, or huddled sat;' trying to throw from them the flakes of fire which came like snow. The devils called out to other devils, thrusting the soul back into the boiling pitch; and looking up, Dante saw them walking on a mount of ice, their teeth chattering, and their eyes locked up with frozen tears."

"Enough of that horrible poet's words. Down, down lower with your heads; we are observed," was Gabriel's quick whisper, which his comrades obeyed by a sudden prostration of the face to the turf. "Rather quick to be successful, friends. There is a figure on the opposite side of the gulf, standing so erect, and so still behind a tree, that I am at a loss to know whether it be friend or foe. Teunis, you look now. The objects round here are all familiar to you."

Teunis did as he was commanded, when he saw the form and face of the Hermit, plainly gazing down into the pit, with the intenseness of one that watches from a tower, on the movements of an enemy. As he did not turn his eye away for an instant, Teunis whispered:

"Lift your heads slowly, and look. The hunters are preparing for a new start."

It was as he said; orders had been given for mustering. The whole body stood in two columns. At the word of command each moved off at a right angle from the other, straight as an arrow, up the opposite sides of the ravine, and as the one remaining at the head of several ranks stood still, till the one who had just left was at least ten rods distant, it took some time before the last two were gone. When these were out of sight, the three young men looked where their fellow watcher had stood, but he was gone also.

"The coast is clear now," said Gabriel, "and Teunis, you must be our guide. My advice is to pass straight through that circle, which these hunters are making. It must be three hours before they complete their search."

"Yes, and an hour more. Let us follow the stream as the safest and the nearest, though it be the roughest road in the world; and who knows but we may find the timid Fawn and her protector in some of the caves formed by the eddying waters."

They descended carefully, looking at every step around them, lest any spy might be left behind. For well they all knew that Brandt was a wily foe, not to be circumvented but by superior wiles.

## WOODED AND MARRIED.

## CHAPTER XXXV. A SHADOW ON THE WALL.

"WHERE is Miss Elliott this morning?" were Guy Chichester's words as he entered the breakfast-room.

Beatrix, who was pouring out the coffee, bent her head over the silver urn, and feigned not to hear the question, but she listened a little anxiously to Stewart's answer.

"No one has seen Miss Elliott, sir. Dorothy—that is, Phyllis—did say to Miles that her young lady must be ill or something, for she hasn't been near Miss Florence since last evening."

Mr. Chichester made no reply; he even checked Flossie when she seemed disposed to burst into some childish confidence.

"Go on with your breakfast, Flo," he said, a little irritably, as the child looked up eagerly; "Trichy, if you have done with Stewart I should like him to fetch me the '*Times*' from the station. Dison has forgotten to send it." And as soon as the servant was out of hearing, he continued, in a low voice, to his cousin, "Isn't it singular, Trichy, the child will have it that Miss Elliott never went to bed at all? She declares she came to her in the middle of the night with her bonnet and cloak on, and kissed her, and said she was going away. What could have put such nonsense into the child's head, I wonder?" But in spite of his impatient tone, Guy looked anxious and perturbed.

Beatrix changed color. "Of course she must have been dreaming, Guy. Children have such strange fancies. Most likely Miss Elliott is taking an early walk; she complained of headache when I arrived yesterday."

"She was perfectly well when I left her," returned Mr. Chichester, uneasily. "Miles told me she was not at dinner last night. I hope nothing unpleasant passed between you, Trichy?" he added, with one of his searching glances. Beatrix was paler than usual—even her cousin noticed her embarrassment. The servants' comments had already reached her ears: she knew from Phyllis that Miss Elliott's bed had not been slept in.

Beatrix drew herself up a little haughtily as Mr.  
VOL. IX.—19

Chichester spoke, but he did not repeat his question; during the rest of the meal he sat in thoughtful silence, and as soon as it was over he left the room and went straight to the library.

His hand was on the bell, when the gleam of something white on his writing-table attracted his eye, and he looked up eagerly: it was a note in Dym's handwriting.

As he opened it and the pearl hoop dropped at his feet, his face expressed bewilderment, almost alarm; but a grave, pitiful look came into his eyes as he read and reread the few blotted sentences, and once he sighed heavily. "Poor child! poor little wounded heart!" he muttered. "Cruel, cruel!" and then his face grew dark and stern again.

"Oh, my dear, my dear, how could you have done it?" she wrote. "If I could have loved you more I must have done it, now that I know all your noble goodness. To think that after her you could stoop to me; that you could put aside your own grief to try and comfort me, poor little humble me!"

"Oh, my darling, forgive me if I call you that once, I never shall again—think how I must love you when I tell you I am going away without even wishing you good-by, to save you from such a sacrifice. She has told me all: it was generous, it was like you, but why, why did you think such noble self-devotion was necessary? You have wronged me, dear, you have indeed, but you did not mean to be cruel.

"If I had left you I should have gone on loving you all my life. I am not ashamed of owning that now; why should I be? You have always been so grand, so noble, in my eyes; and then one day when you were old, and Florence had left you, and you wanted me, I would have come to you and been your faithful nurse and friend, and you would have been glad to see me—I know you would have been—and then this miserable mistake would not have occurred.

"But you must not be unhappy about it, or think I have acted impulsively in leaving you. I could not be your wife now, dear, could I? The

very thought humbles me. Tell your mother all; she will understand and be sorry for me; and ask my darling Flossie not to fret. And now God bless you. I know He will. He will not be angry with me for leaving you so, and you must not be.

"Your faithful and loving friend,

DYM."

Beatrix was still sitting at the deserted breakfast table when her cousin's step sounded in the passage, and a moment after he entered.

She knew what was coming, almost before he had turned the handle of the door. Some subtle instinct warned her that he meant to overwhelm her with his reproaches. Had she gone too far? had she in her sudden madness of jealousy miscalculated this girl's influence? could it be that he loved her, after all—that it was really his desire to make her his wife? Beatrix was by no means devoid of courage, nevertheless her heart died within her when she saw his face.

"Don't, Guy! Whatever has happened, you must not blame me," she said, almost cowering away beneath that dark wrathful look. Bold as she was, how was she to confront him in his sternness? would her pride carry her through such an ordeal? "Indeed, indeed, it was not my fault," she continued, pitifully.

"Read that," was his only answer, as he took the folded paper from his breast and laid it before her. "Do not sully your lips with falsehood, Beatrix," he continued, with a slight accent of scorn. "I know exactly what passed between you, as though I had heard your every word. Oh, Trichy, Trichy," his voice breaking with sudden emotion, "I could almost find it in my heart to hate you for this, that you—you, of all people, should have wrought me this deadly wrong."

"I did not say much—I did not indeed, Guy," she returned, humbly. His anger was dreadful to her. Would she not have died to win one word of love from his lips? and now he was filling her cup to the bitter brim with his righteous scorn. "It was only a word I let fall by accident; she provoked me, she often does, Guy—indeed, you do not know Miss Elliott as well as I do. You must not be angry because I think she is not worthy of you; she has deceived you, as she has deceived others, with her artful ways."

"Take care, Beatrix," he interrupted, menac-

ingly. His eyes flashed, and it was only by a strong effort that he controlled himself. "Take care," he repeated, more quietly; "you are speaking of my future wife. Another such word as that and I shall be constrained to bid you see my face no more."

"Your wife!" gasped Beatrix, and some deadly suppression of feeling turned her lips white. "But she has gone—Miss Elliott has gone."

"You have driven her away for a little space," he replied, in the same hard voice; "but I am still bound to her; whenever she will she may come back, and find her place ready for her, for I swear no other woman shall be my wife."

"Guy! Guy!" But Beatrix's agonized exclamation was unheeded; he had turned away from her with that terrible look still on his face, and in another moment she was alone.

Before the next hour had elapsed, Humphrey Nethcote had been summoned to the squire's library, and for a long time the two men were closeted together.

"You may telegraph your success. If I do not hear before to-morrow night, I shall follow you," were the squire's parting words. "Be prudent; do nothing to compromise her or me, and, above all, do not let her suspect that her movements are watched."

"Let me only know she is safe; that must do for the present. We must leave her free, Humphrey. The mischief is done, and cannot be undone without time and patience."

"Oh, oh, plenty of that needed for a snarl of the devil's making. Take my advice, squire, and get rid of that woman; she was never to my mind, nor to poor Honor's either."

"I must leave that to my mother," returned Guy, with a touch of haughtiness. "I am going up to her room now. Poor dear! she will fret more than any of us. Promise to be wary, Humphrey, for both our sakes," he continued, wringing Humphrey's hand; and then he went slowly and heavily back into his own room.

Humphrey gave a queer little satisfied grunt, when he was left alone, which accorded strangely with the perplexed look of pain his face had hitherto worn.

"It is an ill gait, but it may end better than we thought," he muttered, as he descended the hill; "that is, if it be not the death of her. Poor child! she little suspects the heartache she has

caused. The squire would rather have cut off his right hand than this had happened; he'll be blaming himself and thinking more of her in consequence. If she had had the wisdom of the serpent instead of the harmlessness of the dove, she could not have done better for herself than going away and leaving him to miss her." And the old pain tugged at Humphrey's heart-strings as he thought how dearly and truly Guy would learn to prize his treasure.

"Be you going to Lunnon, Farmer Nethecote?" was Dison's astonished greeting, as Humphrey made his appearance on the high windy platform.

"Oh, eh, we country-folk must be having our sight-seeing sometimes," returned Humphrey, absently. "Yours must be a dull kind of place, Dison; how many passengers do you book an hour, I wonder? And what makes you think I am going to London, Dison, when my ticket is for Harrogate?"

"Folks like you and t' squire aren't over-fond of putting up at Harrogate," returned Dison, with a grin. "Why, when I see t' squire's black bag I say, 'Lunnon, for sure.' Why, you've a bag yourself, Farmer Nethecote, and it ain't samples nor market-day."

"You are a sharp one, Dison," returned Humphrey, trying to speak jocularly, but with an uneasy flush on his honest face. "These Harrogate trains are as unpunctual as ever, I see; our ladies complain sadly when they are out on a shopping expedition and get home late for dinner."

Dison grunted unintelligibly by way of answer. Slowness of traffic was a sore subject with him.

"Miss Elliott will be back in plenty of time, I should think," he answered, crossly. "It is early birds as pick up the worms, as I thought to myself when I served her with her ticket. To think of one of the Ingleside ladies taking the first train! She was asking after my wife at the time, and I never heeded; she asked for a single instead of a double; she'll be finding out her mistake, I'll be bound, before she reaches Hampswaite."

"Oh, the best of us are absent sometimes," returned Humphrey, nervously, as he moved away a step from the garrulous station-master. Dison had been in the squire's service before his brother-in-law had entered it, and was well acquainted with all the doings at Ingleside.

As the train appeared in sight, he heaved a sigh of relief. "There's not a doubt but I am on her

track," he muttered, as he stepped into the second-class compartment. "After all, the squire's right, and she has gone back to the old place."

Little did Dym guess, as she took her weary journey from Harrogate to York, and from York to London, that her faithful friend Humphrey was following in her footsteps.

Guy's unerring instinct had not been at fault; sick and bewildered, almost numb from intensity of pain, yet never faltering in her purpose, Dym watched the flying mile-stones diminish between her and London, and while Humphrey was trying to beguile the longest hour he had ever known on the rampart at York, Dym was dragging herself slowly up the steps of the old house in Paradise Row.

"Richard, Richard, here is our young lady come back!" But Susan Maynard's joyous exclamation changed into one of alarm as Dym tottered into the dusty passage and almost fell into her arms. "Quick, husband, quick! she is going to faint! Oh, what ever has come to my darling, dearie that they have sent her back to us like this?"

"I am not going to faint; I am only so tired." But Dym's explanation was choked by a sudden sob; she cast a bewildered look round the little room, and then at the faces of kind Richard Maynard and his wife. "Where am I? Where is Will? What has happened to me?" cried the poor child, stretching out her hands to them. A moment afterwards she had thrown her arms round Susan's neck, and was crying out to them hysterically to keep her—to hide her somewhere for the dear love of heaven; her heart was broken, and no one wanted her; she would die soon and go to Will.

Oh, if she could only die! That was the one rebellious prayer that rose to her lips morning, noon, and night, during those first few weary days that followed her flight from Ingleside; and, indeed, the girl's sick despair filled her humble friends with dismay and pity.

She had had a great sorrow, and had left Ingleside forever; that was all she told them, but before many hours were over they were in possession of the truth.

"We will watch over her as though she were our own—as though she were little Dick himself," broke out Richard, huskily, as Humphrey, in an agitated voice, prayed them to be gentle with her,

and, as he wrung their hands at parting, Susan sobbed out, "Richard's not the man he was since our Dick has gone, but he'll keep his word; you may trust him, sir. Tell your squire we will guard her like our own daughter."

Dym, lying on her bed, or pacing the room restlessly, little thought of Humphrey's grave whispering under the stars. Once, as she approached the window and drew back the curtain, the sound of footsteps on the pavement below caused her to drop it hastily. The little group broke up somewhat hurriedly after that, and Dym came back and rested her head against the low window-sill. The starlight somewhat soothed her; it made her think of Will and the great cloud of witnesses.

"Oh, Will, are you sorry for me? Do you know how I suffer?" she would say, half aloud, over and over again.

Susan would have guessed the girl's secret even if Humphrey had not imparted it. Dym would start from her sleep with broken exclamations and snatches of words, the bursting forth of a long-pent-up agony. "He is doing this for his mother's and his child's sake, and because he knows you love him," Susan heard her say, one night, when the girl's restless moaning had called her from her bed. "Was it wrong to love you? is it wrong now? how can I help it? oh, my darling, my darling, when I must love you to my life's end!" And as Susan stooped over and soothed her, she broke into passionate weeping, and faltered out between her sobs "that she was very young still, and had no mother; only Will knew, her dear Will; and only he would believe her, that she never meant to harm them like this."

But even in her intolerable desolation, when the memory of all she had lost came upon her, and the prospect of her loveless life filled her with intense loathing, even then she never blamed Guy Chichester.

He had stooped to her out of his nobleness; his very goodness had prepared for her this humiliation; out of pity he had chosen her to be his wife—a wife uncrowned, unadorned by her husband's love. Dym's cheeks would flame with sudden hot pain as the remembrance of the last few weeks flashed before her. Good heavens, how happy she had been! the very sound of his voice in her ear, the touch of his hand on her hair, had filled her with silent ecstasy; his caresses had been few,

but she had never complained of their coldness; his silence had been more perfect to her than another man's words. Absorbed in her worship, she had feasted and been satisfied with a few crumbs of human kindness; but she could not stoop to his pity.

"I could have married you, Guy," she whispered; "I could marry you now; but I should scorn myself for doing it. If you had only wanted me a little, oh, ever so little, dear, I would never have left you; but to make me your wife out of pity" — And her head dropped forward on her breast as Beatrix's cruel words rose to her memory.

But there were times when her yearning would be too great for even her endurance, when she would feel as though she must go back just to look upon the walls of Ingleside and to satisfy herself that he and the child were well. If she could only see their faces for one moment, if she could hear his voice once more, and know that he was not angry with her, she could have borne her misery more bravely; but the utter silence that had fallen between them seemed to the unhappy girl almost like the silence of death.

"He knows where I am; he could seek me out, or send me one word—one word—to assure me of his forgiveness," she said, with the strange contradiction and argument of sorrow. "He is hurt or grieved, or perhaps my sudden flight has angered him; and yet it is not like him to be so hard when he knows—when he must know—how I love him." And the tears rolled down her pale cheeks and fell into her lap. Suffering—the sting and uncertainty of her trouble—was killing her; the dull numb pain at her heart never left her day or night; a feverish restlessness throbbed in her pulse; she grew white and weak, almost to illness; but not for this would she spare herself.

"I must go out and work; if I stay in here and brood over my troubles I shall go mad," she said, one evening, sliding a hot hand into Susan's and looking up into her face with heavy lustreless eyes; but Susan would not help her young lady.

"Work! you're just fretting yourself into sickness, that is what you are, dearie. Here's Richard says you're pining yourself into a shadow; and no wonder, when you eat nothing and can't sleep for sorrowful thoughts. Work! there is not a day's work in you left," continued Susan, indignantly.

Dym smiled faintly at her vehemence.

"If I stay here and think, of course I shall be ill," she persisted, gently. "Dear Susan, don't you see how bad it must be for me? I cannot take another situation, not just yet. I have money enough to last me for a long time. But tell me of some one Will used to know; let me try and help others who are as miserable as myself."

Did she remember who beside Will had worked at St. Luke's? Once Richard Maynard mentioned in her hearing the name of a laborer living in the adjoining street who had met with an accident.

"They say it will cripple him; it is that Bill Saunders that used to be the plague of Mr. Elliott's life. He was one of Latimer's lambs, as they called him. Mr. Latimer had rare work with him."

"Where does he live, Richard?" asked Dym, eagerly. A faint spot of color came into her cheeks; her hands moved restlessly. As soon as it grew dark she tied on her bonnet and hurried round to the sick man's dwelling. "They say I be crippled for life," groaned poor Bill, looking into the sympathizing face that bent over him; "and there be Nancy and the children, who is to put bread into their mouths?"

"I will take care of them; don't be afraid, Bill. If the doctor says your leg must come off, you must make up your mind to part with it like a man; God will take care of Nancy and the children, and I mean to be your friend." Dym spoke with a little flurry and haste; but Bill thought he had never heard so sweet a voice.

Susan gave a little cry of surprise when Dym glided softly back into the moonlight; the eager color had not yet faded out of her cheeks; she looked up in Susan's face with a smile sweet almost to sadness; her voice had a quaver in it of mingled sorrow and joy.

"He is in great pain, but I do not think he will die; we must pray that he will not, for his poor wife's sake. Look here, Susan." And Dym opened her mantle, and there nestled closely at her breast lay a little child.

"It was such a little creature," cried the girl, softly, "and the mother was so worn out with the others, and it fell asleep in my arms, and I thought I would carry it home and take care of it for a little while;" and, her voice suddenly breaking, "They call it Florence."

Somehow, under the dark eaves of the houses in Paradise Row a sigh answered Dym's words: low

as they were, they had been overheard. God bless her for the thought! was she thinking of him as well as the child?

Little did Dym guess who stood outside in the June moonlight—that only a few yards of narrow road divided her from Guy Chichester.

People marveled at the grave bearded figure that stood so long and silently before the humble house. The window was opened; through the screen of plants he could see the soft halo of lamplight, a moth wheeled round it; there was the low chair, the girlish figure in the gray gown he remembered so well; the gentle bent head still stooping over the child in her lap.

What a grave face it had grown! was it fancy or the lamplight? or did it grow suddenly pale, and the lips quiver? What was that sudden mist that blotted it out from his sight, as he turned hurriedly away and strode through the silent streets? Because he has heard a whisper that will haunt him through many a lonely day:

"For his mother's and his child's sake—oh, Flo, darling Flo, I dare not—he would not ask it now."

Few men would have envied the feelings of Guy Chichester as he paced through the midnight streets; some unaccountable sadness and longing had drawn him from his home; some chivalrous instinct impelled him to traverse those weary miles that he might see her with his own eyes, and judge for himself that others were tending her well.

But he never meant to speak to her; her refuge should be sacred from him and his. He thought the time was not come yet that he should dare to plead his cause with her.

"I could not be your wife now: the very thought humbles me." Good heaven, to think how he had failed in his sacrifice! he had meant to shield her with his strong arm, to make her young life a very joy to her, and she had fled from him crushed and broken-hearted.

He had told his cousin that he was bound to her and that no other woman should be his wife. He had sworn it with a blackness of brow that had been dreadful to her; but how was he to win for himself the girlish purity that refused to become an unloved wife?

Did he love her—could he ever love her—as he had loved Honor—the heart of his heart—his very soul—as he had once in his madness called her? Could any other woman, the best, the noblest,

replace the bride of his youth—the mother of his child? He dared not lie to himself; he knew such a thing was impossible; even in his brief sad wooing he had bidden her remember that the best of his life was buried in Honor's grave. No, he did not love her—not as men should love when they seek to gather some young life into their own. For his mother's and child's sake he had wooed her, and because her presence had rendered his hearth less desolate. How was she to know that a growing tenderness was springing up in his heart for her, and that he was longing for her with a soreness that surprised himself?

How the sweetness of her presence had comforted him! Ah, he knew that now. How meekly and quietly she had borne her honors as the future mistress of Ingleside! Her unselfishness, her devotion to his child, had inspired him almost with reverence; and yet with him she had carried herself as humbly as a child.

"You have always been so grand, so noble, in my eyes," she had said to him, once, and he could feel the soft touch of her little hand as she had timidly stolen it into his in the twilight. At a word of praise from him her dark eyes would shine like stars, and her face would be covered with blushes. "You are my king, I must serve you always," she had whispered, once, as she performed some little womanly office, and he had smiled in his sad way and let it pass.

Ah, he knew well how she loved him: the very sense of his power over her made him shrink in very delicacy from taking an undue advantage. "If I go to her and tell her that I want her, that my home is lonely and my heart heavier than ever without her, she will come to me—I know she will—but I shall not make her happy. If only some chance would bring us together, and I could tell her that her place is ready for her, and that I want my little friend to be always near me, I think she would come and cling to me as she clung that last time; and perhaps I might teach her to trust me once more." And again the mist swam before his eyes as he remembered how that evening he had ridden slowly between the limes, and had seen her standing, a little shimmering gray figure, motionless in the sunlight.

So Guy Chichester went back to Ingleside, and worked hard, and rode, and played with his child, and talked with his faithful friend Humphrey; but ever as he sat alone or paced the moonlight

terraces, one picture rose before his eyes—the figure of a girl with dark sweet face and shining head, bent over a sleeping child.

"It is such a little creature, Susan," he could hear her say, "and it fell asleep in my arms, and they called it Florence." "Come hither, Flo, my darling. Do you love papa or auntie best now? What! auntie still? Hush don't cry, my child: auntie will come back to us soon."

The June days had worn heavily away, and then July and August, and the humble folk in Paradise Row began to whisper and shake their heads as Dym's slight figure came down the hot sunny streets. "She has a purely white kind of wasting look," one of them was saying to Susan Maynard: "that's how my Willie was took—fretted and pined himself into the grave. She has a look like Mr. Elliott when he was rarely bad."

"It is the mind wearing on the body, that's what it is, neighbor," returned Susan, lifting her apron to her eyes. She had been shedding tears recently; but she wiped them now hastily away, as the young lady came wearily down the street.

"Am I late, Susan? are you looking for me? Poor little Robert was so near at his end that I waited till all was over; he died so happily, Susan."

"You look every bit as bad as him," returned Susan, in a vexed tone, "not a speck of color in your face. You'll not take it to heart, will you, my darling dearie—you'll be good and brave even if there is more coming to trouble you?" she continued, in a caressing voice, as she drew Dym gently into the passage.

"It did not trouble me; dear little Robert was so glad to go; he said a prayer so prettily—Oh, what is that?" as a dark shadow fell against the narrow entry.

"It is only Mr. Nethecote: you will be good and brave, dearie?"

"Yes, it is only I," said Humphrey, coming forward and holding out his hand: his face had a grave sadness on it; his great hand trembled as Dym's little fingers clung to it. "I have come to fetch you, my dear; the squire wants you—we all want you. We fear he is dying."

#### CHAPTER XXXVI. THE LAST OF THE COBWEBS.

It is impossible to describe Dym's feelings as Humphrey delivered himself of the sorrowful message.

"It seems I am always to be the messenger of evil tidings to you, my dear," he said, tremulously.

It was hard on him; why was he ever constrained to give her pain? his heart throbbed with great pitiful beats as he watched the girl's silent anguish. She had uttered a low glad cry of recognition at the sight of her friend; but now she stood white and stricken, clinging to the fond hand that had dealt her this second blow.

"Hush! it is God's will: if it comes we must try to bear it."

"Is it God's will? it is not true. He cannot mean that, surely," exclaimed the poor child. Her hand closed around Humphrey's almost convulsively; an awful pallor came over her face; a powerlessness that was not faintness seemed creeping over her; her heart felt like a stone in her bosom; she was stifled, suffocated.

"Oh, it is not true! I cannot bear it!" came in a hoarse cry, almost a shriek, from her lips. Was this the end of her love and faithfulness? Guy, her Guy, for whom she would have laid down her life, dying!

"Hush, my dear, hush!" cries Humphrey, with a sob. Sick and dizzy, she had turned from him, and had sunk, nay, almost fallen, into Will's chair. Humphrey watched her as she lay with her head flung back on the horse-hair cushion till his honest heart was almost broken; her face looked almost as gray and drawn as the dead man's had done. "Oh, my child, hush! they think so, but doctors are often wrong; we will not lose hope, you and I," he said, leaning over her with tears in his eyes and stroking the cold little face with his great hands. Dym's feeble fingers suddenly stopped him.

"There is hope, then? everything is not lost?" she said, half rising in her hysterical agitation. "Oh, Humphrey, you might have killed me," pushing her hair from her face and looking at him with wild pathetic eyes that stabbed him afresh.

"Nay, nay, Dym—it was my clumsiness; it seems no good beating about the bush when there is bad news to be told—and it is bad enough, God knows. When they brought him in, more than one of us thought it was all up with the squire."

"You have not told me, Humphrey—was it an accident, then?" cried Dym, faintly; the numbness was creeping on her again.

"Ay," he replied, slowly, drawing the cold

hands into his own to warm them. Dym shivered and hid her face, as bit by bit he imparted the terrible news. A whole world of horror and doubt lay in Humphrey's succinct narrative. Guy had been trying a new mare that he lately purchased—a beautiful creature, but vixenish and wild-blooded, and almost as uncontrollable as an unbroken colt.

"I had warned him against her, my dear," Humphrey had explained, in his mild way, "but you know the squire, when he has got an idea in his head. The mare was his last new hobby, and nothing would do but he must break her in himself. No one knows how it happened; something—a shot from the plantation—startled the animal; but she reared, lost her balance, and, before the squire could get his foot out of the stirrup, she fell backward on him."

"Humphrey," cried the girl, starting up in a sudden agony, "you are not keeping anything from me? he is not dead?"

"Nay, nay; things are bad enough without making them worse; he has some of his ribs broken, for she rolled right over him, and they say one arm is injured; but it is the head, Dym! they fear congestion of the brain. It is three days ago, but he has only spoken once, and that was to ask for you."

"And when was that?"

"Last night; that is why I am here now."

"Why are we waiting, then? we are losing time. If we should be too late? Oh, Humphrey, take me to him," clasping her hands around his arm.

"Of course I will take you to him; what else have I come for?" returns Humphrey, in a slow, kind voice, that somehow soothes the girl's agitation.

She lay back passively after that, and let Susan make her little preparation.

"Good-by; Humphrey will take care of me," she said, smiling sadly into the faithful creature's tear-stained face, as she drew down her veil and sank into the corner of the carriage.

"You must not try to fret, Dym; while there is life there is hope," Humphrey said, once, trying to rouse her.

Dym's head dropped upon her breast, but she made no answer. Would that weary journey ever end, the girl wondered? She could hardly have borne it but for Humphrey's kindness. Dym was

so utterly spent that she could only thank him with faint smiles. She swallowed the wine he brought her at York, but she could not eat; some choking oppression lay at her heart. Her ghastly looks alarmed Humphrey. Would the flying mile-stones ever lessen? Would they be too late, after all? And then came the sickening thrill of recognition—there was Birstwith at last!

"They have sent up the wagonette; he is not worse, Dym."

Humphrey talked fast and eagerly as he hurried Dym along the little platform. There was Dison, touching his hat officiously; there were Stewart and the bays waiting for them.

Dym drew down her veil more closely as they dashed through the village. Every one would know her, of course. There was the mill, and the weir; the boys were splashing bare-legged among the boulders as usual; there was the Nidd rippling with streaks of silver through the trees; there were the church and the vicarage; the lodge-gates had opened and closed after them, and they were whirling through the shrubberies. Gray-headed Miles was waiting at the hall-door, and then Humphrey came around and lifted her out.

"Go into the drawing-room; I must find Mrs. Chichester," he whispered; but Dym lingered.

"Don't keep me from him, however he is. I will be good; you know I will, Humphrey," she implored; but Humphrey's only answer was a reassuring smile, and he was turning away, when Florence suddenly ran in from the dark hall and flung herself upon Dym.

"Oh, Flo! Flo! Flo! my darling Flo!" cries Dym, with a sudden sob, as the child nestles delightedly in her arms. "Have you wanted me, Flo?"

"Naughty auntie, to go away," returns Florence, with a shower of kisses, that seem to cool the girl's hot brain.

"No, you are not to cry; grannie is crying now, and all because papa is better. Yes, papa is better, and grannie says so; and you are to come to her now at once."

"Courage, Dym," says Humphrey, with the same kind smile; but all the same he has almost to support her under this new dizziness. Better! What! is there mercy in heaven for them even now? She goes up the staircase panting and breathless, with the child still clinging to her.

"Oh, my dear! my dear! God has been good to us. He has slept! he is better."

Dym never knew what answer she made. She heard Humphrey say, "Thank God!" devoutly, as though he were in church. She heard Florence exclaim, "How white auntie looks! poor auntie!"

"Leave her to me, Humphrey; I know what it is," says Mrs. Chichester, gently.

Yes; he thinks he may leave them safely now, as he sees the two women clinging together. He knows the girl's tortured brain will relieve itself in tears on her friend's bosom.

"He is saved—they do not fear for his brain now. Oh, Dym, is it not Goodness itself watching over us? My boy is spared to his mother—spared to us both."

"Hush! I am content, though it be only to you. Can you not understand that?" interrupted the girl, flushing and paling, as the blind face bends tenderly over her. "Oh, I have been wicked; I have almost died of it," she whispered, covering her face with her hands; "and now this has happened to punish me for my selfishness. Dear, dearest, I can be happy now, though his life is only spared for your sake," kissing the wrinkled hand as she spoke.

"You are my own little daughter, whatever he makes you," was the fond reply. "Dym, you must never leave me again. I cannot do without you. I think he has wanted you badly too, though he has never said so until last night."

"No, no," almost panted the girl; "you must not talk so; it is not right; and he lying there brought back to his mother and child from the very gates of death."

Mrs. Chichester smiled as she put her hand fondly on the bowed head. Dym's tears still flowed, but her pale face was radiant. He would not die; he wanted her; he had asked for her; she should see him again. Dym's simple loyalty could go no further than this; more would have dazzled and overcome her, but now she was content.

She would see him; she would nurse him. He had forgiven her, and would be her friend again; here was matter for rejoicing. She acquiesced without regret when she heard he had taken his sleeping-draught, and that she must not see him that night. She lay down in her little bed spent and worn out by conflicting emotion, and even in the midst of her *Te Deum* fell into a heavy dreamless sleep.

It was not until the afternoon of the next day that Dym was admitted to the sick-room. She had been wandering about her old haunts, hand in hand with Florence, trying to beguile the feverishness of waiting, and was looking pale and worn, when Humphrey came in search of her.

"You may come now, Dym; he has been asking for you several times, but he looked feverish, and we thought it better to wait. You must be quiet, and soothe him if he speaks; it is early days, and we must be careful still, Dr. Grey says."

"Yes, I know," was Dym's hardly audible answer, as she prepared to obey Humphrey's summons. Kelpie was lying at the door of the sick-room; a sudden mist swam before her eyes, as she stooped to caress him.

It was a close sultry afternoon, and the windows had been flung open that the air might refresh the invalid. Mrs. Chichester sat beside the farthest one; her knitting had fallen into her lap, and on the bed lay the motionless figure, high up on the pillows, with one bandaged arm resting on the coverlet.

At Dym's hesitating footstep it stirred slightly, and a smile passed over the pale face.

"At last, my child; you have come at last," Dym heard, in the old well-known voice.

"Oh, Mr. Chichester!" Dym could say no more, as Guy Chichester stretched out his uninjured arm and drew her gently towards him, trembling from head to foot, and hardly able to refrain from tears.

"Sit down; no, you must not stand. Poor child, it has gone hardly with you, I see. Dym, are you so sorry for me?" his own eyes moist, as he saw her emotion.

"It might have been your death. Hush, you must not talk, indeed you must not, Mr. Chichester." Dym in her agitation is unconscious that her tears are falling now on the hand that still holds hers.

"Are those tears for me? Oh, my child, I do not deserve them," he whispered, lifting the little hand to his lips. "Dym, have you any idea how I have wanted my little friend?"

"She is here now," was the unsteady answer.

"Yes, she is here, thank God! Dear, you are right; I must not talk much, my head is not to be trusted. You will not leave me again, my child?"

"Not while you want me," returned Dym, unconscious of any meaning attaching to his words. His smile mystified her.

"That is well; one day I shall remind you of your promise," he replied, in a voice so faint that Dym forgot her agitation—everything—in the desire to relieve his evident suffering.

Before many hours were over, Dym found herself installed in the sick-room; the mother could only sit helplessly beside her son's bed, the brunt of the nursing fell on Dym and Humphrey. Humphrey was strong and helpful, but Dym's tender ministries were most grateful to Guy Chichester, lying sore and bruised and in secret anguish of pain; he suffered less when Dym dressed his injured arm; her cool skillful manipulations afforded him comparative ease; by the unerring instinct of love she guessed his wishes; the cooling drink was at his lips, and the fragrant water laving his burning head, before he had shaken off the indolence of weakness sufficiently to frame them in words.

"How good you are to me! have you found your true vocation now?" he whispered, once, as she stooped over him to turn the heated pillow, and he looked at her a moment with something of his old drollery. Dym turned away without answering, but her color rose; it seemed to her half a lifetime ago since that talk in the little room in Paradise Row, when the tall bearded stranger had watched her from Will's chair with grave quizzical eyes, and had told her that nursing and not teaching was her vocation, and she had answered him with girlish vehemence.

"Come here, my child. Have I hurt you?" And there was a wistful look in the dark eyes as he stretched out his hand to her.

Dym shyly shook her head.

"No; only I am so glad to be able to do anything for you, and—and it seems so strange looking back at those old days, Mr. Chichester."

"Mr. Chichester! you must find some better name than that; it sounds cold from my little friend's lips. How your hand trembles! There, God bless you, my—my child!"

He bit his lip as though he had suddenly remembered something, and Dym drew back into the shadow of the curtain, strangely agitated and happy.

Yes, happy! though once she had been his betrothed wife, and now things were at an end between them, and he was only her friend.

Dym's simplicity and unselfishness stood her in good stead at this juncture of her life; she had accepted a difficult position with the grace and

unconsciousness of a child. She had met her lover that first day with some natural agitation, but the sight of his suffering had banished all feeling of weakness into the background; he was ill and needed her, that was sufficient for the present, the future must take care of itself. When her work was finished—ah, well, she could but go away again; she must not think of herself now, and so she moved about his room with a face of sweet gravity that moved Guy strangely with a thousand vague feelings of remorse and pity.

"You are altered, Dym," he once said to her, passing his hand softly over her hair; "you are worn and thin and look years older, and all this nursing will not bring the roses back."

"I can do without them," was the quiet answer, but she blushed crimson under that tender scrutiny; such speeches moved her from her calmness. Guy looked at her sadly for a moment, and then, muttering some impatient protests against his weakness, turned away with a sigh.

Those weeks were teaching Guy Chichester strange lessons; chained down by impatience of weakness, and brought face to face with acute suffering, what marvel if the man read the story of his life again under new lights, and, weighing himself in sterner balance, found himself wanting!

Life had come to him in all its reality, and he had made it a pitiable failure; he had centred his all on an earthly shrine, and Divine jealousy—righteous in its retribution, unerring in its wisdom—had riven his idol from him and left him alone, maddened with his loss.

How many talents had he had intrusted to him—strength, and wealth, and intellect; philanthropy wide enough to embrace a world—influence that none could resist! and how miserably he had squandered them all! He had had his portion of goods, and no spendthrift could have wasted them more unprofitably. Great souls have great repentances; verily, there is hope, and to spare, when such men as Guy Chichester turn their faces to the wall to commune with their God and be still.

Sometimes in the dead of night, when the shadows of the night-light glimmered on the ceiling, and Humphrey dozed beside, half-forgotten snatches of verses that Honor used to sing came to his mind; and one especially haunted him that she had sung that Sunday night at Mentone before her baby was born:

"While we do our duty,  
Struggling through the tide,  
Whisper thou of beauty  
On the other side."

"Oh, Honor, be my guardian angel still," he whispered; and out of the darkness her sweet, serene face seemed to smile on him in answer.

"He will come back, my girl; I know him well; these noble souls are not kept to wander in outer darkness. Ah! what if the mysterious communion of saints' wives in paradise do verily and indeed watch over their husbands upon earth!"

It was weeks before Guy Chichester shook off the effects of his accident; weeks before he could be moved from his bed to the couch; weeks before, a mere shadow of himself, he crept, supported by Humphrey's strong arm, to bask for an hour on the sunny terrace.

Dym looked sadly after him, as she thought of the strong, vigorous Guy Chichester of old, and contrasted him with the tall shrunken figure before her, bowed with weakness and prematurely gray-haired.

It would be long before he would look himself, she thought. The injured arm had healed, but the shock to the nervous system had been great. When the cold weather set in, he must go to the South, Dr. Grey told them; for months to come he would require care and nursing—months before he would be comparatively strong again.

Dym listened and sighed; her work was not over yet, she thought; and then she wondered what grave consultation had detained Dr. Grey so long in the library that morning. Mr. Chichester had been more than usually thoughtful for some days, and Dym was sure something was on his mind; he had scarcely looked at her or spoken to her lately; and yet, when he had addressed her, his manner had been as kind as usual.

It was October now, and the evenings were growing chilly; a small wood fire of Guy's favorite pine-knots had been lighted in the library, and Guy, who was weary with his unusual exertion, had been lying quietly all the afternoon—half dozing, half enjoying the pleasant warmth—when he suddenly roused into a sitting posture and asked for Dym.

"She is here," in a quiet voice behind him. "I thought you were asleep, and was afraid to disturb you even for this," showing the glass in her hand.

"Always my attentive nurse," looking at her gratefully, and drinking the restorative. "You are pale and tired, Dym; I shall have to be waiting on you next."

She smiled at that—a quaint little smile—but full of sweetness.

"I shall have time to rest when you have dismissed your nurse, Mr. Chichester."

"Mr. Chichester—always Mr. Chichester!—so you are waiting for your dismissal, eh?"

His tone was so abrupt, almost displeased, that Dym looked in his face quite startled; what she saw there made her flush scarlet.

"Come and sit down. You are right; I am growing tired of my nurse; I want my little companion instead. Nay," as she faltered out some excuse about leaving him, "I have long been thinking we ought to have some talk together, you and I."

"By and by, another time—not to-night," stammered Dym. She was trembling from head to foot. Why did he want to speak to her? he was well now, and she must tell him that she must go away again.

"Poor child! she has grown to be afraid of me," he said, gently smoothing her hair and drawing her closer to him. "Dym, have you ceased to trust your friend?"

Her only answer was to hide her face in her hands, and pray him to spare her. Bursting into tears, she implored him not to speak to her—to let her go—and not be good to her, for she could not bear it.

"Why should I let you go, when I want you?" he answered, gently, and there was something in his firm pressure of her hands that soothed even her exceeding agitation. "Dym, I never mean to let you go. What do you mean? have you forgotten your promise?"

"What promise?"

"To stay with me while I wanted you. Dym, I want you always. Did you not understand my meaning? I was too weak to explain."

"No, no," she said, starting from him. "Mr. Chichester, you must not talk so; it is not right, when you know"—She stopped, and her face was dyed with crimson.

"What do I know, dear? that you are my affianced wife!"

"No, no," she repeated, in a heart-broken tone. "We have altered that—my letter has altered that."

No, do not be kind to me," as he only pressed her hand more tenderly. "I have given you back your troth; you are free, quite free; I have made you so. I am nothing to you—nothing but the poor little friend who has loved and nursed you."

He smiled at that, a sweet benign smile that seemed to bless her, and strove to draw her more into his sheltering arm.

"I think you are more than my little friend."

"No, Guy, I am not," using his name for the first time, in her agitation.

"Yes, you are; you are my darling, my wife that is to be; I have never been free. I never wish to be free. Have you misunderstood me all this time, my child? It has come to this, that I cannot do without you, Dym, that I want you always."

Did she dream the words, or did he speak them? was that earnest voice, so sad and yet so sweet, speaking to her?

"I have my faults, no man more; but I never wilfully deceived you. I have buried the best part of my life in Honor's grave; nay, do not shrink from me, dear, I have told you this before; if you can be content with such love as I can give you, for God's sake come to me, Dym, and make my desolate life less desolate. I love you very dearly for your own sweet sake."

"Really and truly, Guy?"

"Really and truly, sweetheart."

"Oh, I am happy!" Dym scarcely breathed the words, but Guy heard them, and, with a strength of which he could scarcely believe himself capable, he lifted the little creature in his arms, and felt her nestle to his bosom, keeping her there till she had sobbed out her artless confession of love and sorrow.

"You must teach me to be more worthy of it, Dym, darling," he said, gravely, when their excitement had a little subsided, and Dym sat beside him with her dark eyes brilliant with shy happiness. "I have been a sad failure. What am I, that two such pure hearts should have made me their happiness?" And a look of terrible exhaustion passed over his face as he recalled his wasted life.

"You must not talk any more Guy," she whispered, laying her little hand timidly on his forehead. Guy paid it tribute gratefully as it passed his lips. "You must let me be your nurse a little longer without wearying of her."

"You shall be what you like," he replied, unclosing his eyes; "but I know what I shall soon want to make you."

Dym's head drooped against his arm, but she made no answer.

And so the last cobwebs were swept away, and the great dazzling sun of requited love shone down into Dymphna Elliott's woman-kingdom; the evil fairy had done her work and earned her own confusion.

Guy Chichester was not one to brook long delays; Dym had suffered enough, and he wanted her sweet ministries in all their entirety. "When will you come to your gray-haired lover?" he said, one day, smiling fondly as she took her low seat beside him and looked up at him with worshipping eyes. "Little Sunbeam, I want you always shining on me; you have no idea how dark it is when you are away."

"What do you mean, Guy?" but she knew what he meant, and blushed beautifully. And Guy, who loved beauty in women, and remembered Honor's perfect grace, thought, with a strange thrill of pleasure, how very pretty Dym had grown, and wondered that he had never noticed it before.

And so it was, that one gusty November day, in a strange old city church, Dymphna Elliott became Guy Chichester's wife. Humphrey gave her away—honest Humphrey, who craved to do it, with tears in his eyes—Humphrey, who took her in his arms and blessed her, and put her hand in Guy's.

"I doubt if even you are worthy of her, squire," he said, gruffly; "but the gift of such a heart must make any man rich. There, good-by, God bless you, dear; and don't forget your old friend Humphrey."

Forget him! Does a woman ever forget the man who has blessed her with his honest love? Dym ever clave to Humphrey with truest, deepest

affection, when out of the wealth and glory of her perfected life she strove that a little sunshine should stream on the path of the childless man; when his dream had come true, and her children and Guy's climbed upon his knees, and filled his lonely home with childish voices, when she could smile on him and call him friend and brother, and knew his honest heart felt no pang, and only rejoiced in her happiness.

And who could measure that happiness?

Look at her sweet face, which her husband declares grows sweeter every day, and which no cloud of regret ever darkens: is there any limit to her joy?

Day by day she knows she is more surely winning the noble heart of Guy Chichester; day by day he looks at her with fuller content, with deeper tenderness; day by day the deadly wound of his lost love heals into chastened remembrance and present peace.

"My wife has been my comforter," he said, once, to Humphrey, and Humphrey looked at him with his old wistful smile and nodded, and Guy went back across the plowed wintry fields, and under the starlight, and saw the light of home shining through the leafless trees.

"You are late, love; little Humphrey has been waiting to say 'Good-night' to you." A little figure in shining silk glides out of the firelight and steals into his arms.

"Were you waiting for me, my wife? I was with Humphrey—nay, never mind our boy; we have been talking of you, sweetheart."

"Of me!" She lifts her loving eyes in surprise as he holds her closely, very closely to him, and then releases her.

"What! wondering, love! Nay, I was only telling Humphrey that my little wife has been my comforter."—THE END.

## SONNET,

WRITTEN IN GRACE AGUILAR'S "DAYS OF BRUCE."

By T. H. G. LA MOILLE.

Those crumbling walls and tottering battlements  
Are ivy-wreathed. Life's emblems 'mid decay,  
The ivy shows us that the bravest sway  
This world, and *will* is more than armaments.  
Now, this Lock Alva's sleeping lips are kissed  
By the just-risen sun, and birds are gay;  
Out in our castle-yards hear pibrochs play.

See bold-front legions stand 'neath rising mist!  
Our banners wave us on to Bannockburn!  
( 'Tis Scotia's brightest day in glorious June.)  
Shrill shouts and claymores drawn portend that soon  
Each soldier's nature shall to fury turn.  
Woe worth the day if these our nobles fall:  
Saving their country, she will love them all!

## GLIMPSES OF THE PEPYS DIARY.

BY HENRY C. MICHENER.

IN his unrivaled way, Lord Macaulay thus assigns the true limitations of historical excellence: "The perfect historian is he in whose work the character and spirit of the age is exhibited in miniature. He shows us the court, the camp and the Senate, but he shows us also the nation. He considers no anecdote, no peculiarity of manner, no familiar saying as too insignificant for his notice, which is not too insignificant to illustrate the operation of laws, of religion, and of education, and to mark the progress of the human mind. The changes of manners will be indicated not merely by a few general phrases or a few extracts from statistical documents, but by appropriate images presented in every line." The spirit of this deliverance infuses modern taste. The writer who can cross the gap of centuries and drop us down in street or field among the men of other days and permit us to sit with them at their employments and their diversions, who can enter with us into their joys and sorrows and bid them speak to us in their own tongue, has attained the summit of his art.

Modern readers are exacting. They desire to know the past as the past knew itself. This is the reason why the informal jottings of mere diarists are caught up by narrators who know the fountains whence flow what is most trustworthy in history.

Fortunately that epoch which marks the transition of the English people from the ascetic rigor of Puritanism to the license of the Restoration, has been delineated to the last degree of fidelity by several journalists, the greatest of whom was Samuel Pepys. No historian of that period can pretend to shadow forth its remarkable features in their due proportion and detail without frequent demands on his remarkable work. His position in society was such as to afford him the fullest opportunity to see the best and worst of his countrymen. He was an eye-witness of the extraordinary scenes which attended the dissolution and the revival of the Stuart dynasty. He saw the head of Charles I. roll from the block. He was on board the vessel which brought the second Charles from the Hague to England. He wit-

nessed the impressive procession from the Tower to Whitehall, when the old city had "a glory about it." He was present at Westminster during the splendid ceremonies of the Coronation. His diary covers nine years and five months—from January 1st, 1660, to May 30, 1669. It is enough for our purpose to say that during the greater portion of his life of seventy years, its author held a responsible trust in the English admiralty. He was an educated gentleman and possessed a remarkable faculty for minute observation, which was facilitated by his knowledge and use of shorthand, in the characters of which his diary was written.

While this unique journal was in progress, nothing which illustrates the everyday life of a well-to-do Londoner of two and a quarter centuries ago, escaped his attention. So closely is the record kept, that much of its contents is really below the dignity of history and serves only to indicate the great fidelity with which the journal was written up from day to day. Thus, August 22d, 1662, Pepys sets down this: "About three o'clock this morning, I waked with the noise of the rayne, having never in my life heard a more violent shower; and then the catt was lockt in the chamber, and kept a great mewing, and leapt upon the bed, which made me I could not sleep a great while;" and on New Year Day, 1662, he gravely announces that "waking out of my sleep this morning owa sudden, I did with my elbow hit my wife a great blow over her face and neck, which waked her with pain, at which I was sorry, and to sleep again." But there is scarcely a page of the Diary which does not bristle with the most valuable materials illustrative of the domestic life, occupations, manners, customs, amusements and dress of Pepys's time. The salient events noticed by him and the more striking incidents of the era have found a place in the writings of all historians, but he has preserved numberless unconsidered trifles which the curious reader must seek in the Diary itself. The quaint diction of this brief chronicler, the old idioms used by him, and the obsolete spelling, present a rich field to the student of our mother tongue; but the form of Pepys's

work makes it distasteful to many, and its revelations of bygone days are thus lost to the general reader.

The first and perhaps the strongest impression one derives from the Pepysian Diary is the spirit of conviviality which prevailed at the period of the Restoration. Pepys himself was given to excesses, which became alarming to himself, and accordingly, on December 31st, 1661, we find him "swearing off" from theatres and wine. This oath, with the exception of infrequent relapses, he seems to have observed during the rest of his career. Before this new year resolve he frequently confesses in his Diary that he was "foxed." The London taverns were then the resort of an elegant and exclusive society. Pepys was an habitué of such famous resorts as "The Dog," "The Half Moon," "The Mitre," "Brazen Nose," "The Bear," "Hercules Pillars," "The Globe," "The Greyhound," "The Fleece," "Heaven," "Hell." The bibulous disposition of the age is strongly indicated in the fact that wine was furnished at the funeral of Pepys's uncle Robert in 1662.

Great stress is also laid on gastronomical topics. Pepys was a good liver. In the earlier part of his career he speaks of a breakfast of cold turkey-pie and a goose. On another occasion he feasted a considerable company on stewed carps, six roasted chickens, a "jowle of salmon for the first course; a tanzy, two neats tongues, and cheese, the second." This repast was prepared by a male cook, a luxury for which four pounds a year was paid. In 1661 he deems it of sufficient importance to mention his use of asparagus, which as the manuscript was deciphered was spelled "sparagus." January 15th, 1662, he enjoyed "a wild goose roasted, a cold chine of beef, and a barrel of oysters." On April 4th, 1663, the bill of fare was "a fricasse of rabbits and chickens, a leg of mutton, three carps, a side of lamb, a dish of roasted pigeons, four lobsters, three tarts, and a lamprey pie." Record is made of the last meal eaten on board "The Naseby" by Charles II. just before he landed on English soil. The repast consisted of "pease, pork, and boiled beef." Pepys was present on this occasion.

He says, November 25th, 1660, he tasted "tee" for the first time, and a "brave cup" of methiglin on February 29th, 1660.

In that day the reverence for the institutions of religion had greatly relaxed. The austere manners of the Protectorate were passing away; many

became as zealously wicked as they could without utterly discarding the conventional forms of worship. It was the rebound of human nature from the tension to which it had been subjected under Cromwell and Barebones. Pepys was a regular attendant at the London churches, but aside from a formal assent to Christian doctrine and practices he does not seem in the earlier portion of his life, at least, to have been distinguished for his piety. Thus on Sunday, or "Lord's Day" as he invariably terms it, May 5th, 1661, after hearing a sermon at the Abbey he confesses that he "played the fool" by engaging in a jumping match with a Mr. Creed, and won a quart of sack by his performance on that day. On another Sunday, September 29th, 1661, he owns to have taken so much wine that he became "foxed." Our historian waggishly comments on a sermon he heard at Westminster, where the speaker "desired of God that he would imprint his words on the thumbs of our right hands and the right great toes of our right feet." Under date of March 31st, Pepys flatly says he heard a stranger who "preached like a fool." There are, however, many passages in the Diary where he refers to the London clergy in terms of respect and commendation.

A person of Pepys's disposition was, of course, a regular visitor at the London theatres. Beaumont, Fletcher, Rowley, and Shakspeare were the dramatic favorites. He frequently praises Betterton, the actor, and warmly applauds his *role* of Hamlet. At the house of the Duke of York, May 28th, 1663, he saw Betterton play that part when he received "fresh reasons never to think enough" of this player. Managers pursued the same methods as do those of our time, when it is necessary to fill up silent parts, for which there is no performer present. Thus he relates, October 31st, 1662, Thomas Killigrew's way of getting into the "Red Bull" theatre when he was a boy. "When the man cried to the boys, 'Who will go and be a devil, and he shall see the play for nothing,' I would go in and be a devil on the stage and so get to see the play."

Of the minor amusements, dancing appears to have been cultivated with much spirit. Pepys employed a dancing master for Mrs. Pepys and himself, and attempted to learn the steps of "the Coranto." He holds that this accomplishment was very useful for any gentleman. At a ball, December 31st, 1662, the King and the Duchess

of York, with other distinguished couples, danced "the Brantle," "the Coranio," and country dances, among them one called "Cuckolds all awry," which, Pepys says, was the old dance of England. The musical instruments in use were "the violin," "the harpsicon," "the bandore," "the ciththerne," "the dulcimer," and others.

That society was then pursued by the same annoyances and deceived by the same illusions which continue to fret the world is indicated in the entry of November 25th, 1662, where Pepys announces that the "Fanatiques" predict the end of the world on the following Tuesday, December 2d. He does not seem to have been greatly disturbed by the threatened destruction, for, on December 1st, the day preceding the predicted downfall, he amused himself for the first time in witnessing the new pastime of sliding on "skeates," which he considered "a very pretty art." On the evening of the same day he went to the Cock-pit theatre to hear Betterton.

The Diary describes many usages which have long been abandoned and articles of fashion or utility which have fallen into disuse. The pumice stone was used by Pepys for shaving (then called "trimming"). Mention is made of this practice, Sunday, May 25th, 1662, in this way: "Trimming myself which I have this week done every morning, with a pumice stone, which I learnt of Mr. March when I was last at Portsmouth; and I find it very easy, speedy, and cleanly, and shall continue the practice of it." For the vagaries of dress he everywhere betrays a feminine devotion. He gloats over a certain Sunday rig of Mrs. Pepys, "a green petticoat of flowered satin with white and black gimp lace," and his own "fine camlet cloak with gold buttons and a silk suit."

In 1663 the fashion for men was a black cloth suit with white linings under all. In that year when mourning for his brother, the king wore purple, a color which has long been discarded as a badge of woe.

A curious entry is made, November 20th, 1660, describing a visit made by Pepys and his wife to the Queen's presence chamber. "The Queen is a very little, plain old woman, and nothing more in her presence in any respect nor garbe than any ordinary woman. The Princess Henrietta is very pretty, but much below my expectation; and her dressing of herself with her haire frized short up to her eares did not seem so much the less to me. But my wife standing near her with two or three black patches on, and well dressed, did seem to me much handsomer than she." Change in manners is strongly shown in the frequent use of the word "Esquire" in our day. In Pepys's time it was a real distinction, and he gloats over the superscription "*S. P. Esq.*," which he found one day on a letter received by him, and quaintly remarks that "he was not a little proud of it."

The Diary abounds with many evidences of the writer's devotion to the person and interests of Charles. He was among those who drank to the health of that monarch on their knees in the streets of London. Every incident, however trivial, which bears any relation to him is carefully preserved with loyal affection.

Pepys does not omit to make mention of "a little dog that the king loved" which went ashore with him from "the Naseby," May 26th, 1660; nor of a certain mark which the king made on the same vessel with his own hand to show his stature. This mark Pepys caused to be gilded. This high regard for the king was returned by the latter, for Pepys records that when the royal progress was made from the Tower the day before the Coronation, April 22d, 1661, when the show of gold and silver was so glorious that Pepys was not able to look at it, when Charles Stuart appeared in a rich embroidered suit and cloak, surrounded by "a vast show of embroidery and diamonds," and encompassed by companies of "comely young men in white doublets," Pepys was thrilled with joy because Charles and the Duke of York both "took notice" of him as he sat at a window.

## PRESENTIMENT.

By MRS. L. M. B. PIATT.

THE world is sweet, in bud and broken rose—

In song and hush of bird, the world is sweet;

In tryst of dew and leaf; up heights and snows;

Down secret seas where moons and dead men meet.

Yet if, to-night, I wore a royal ring

Under high palace lights, I might be wise

To hide therein a poison that should bring

Quick death, to shut this Shadow from my sight.

## THE MYSTERIOUS PROMISE.

By P. P. C.

IT is somewhat singular that the natural longing to penetrate the great secret of mortality should not have suggested to some of the inquirers into so-called "Spiritual" manifestations, that, before attempting to obtain communication with the *dead*, through such poor methods as raps and alphabets, they might more properly, and with better hope of gaining a glimpse through the "gates ajar," watch closely the dying, and study the psychological phenomena which accompany the act of dissolution. Thus, it might be possible to ascertain by comparison of numerous instances, whether among those phenomena are any which seem to indicate that the Mind, Soul, or Self, of the expiring person is not undergoing a process of extinction, but exhibiting such tokens as might be anticipated were it entering upon a new phase of existence, and coming into possession of fresh faculties. It is at least conceivable that some such indications might be observed, were we to look for them with care and caution, under the rare conditions wherein they could at any time be afforded; and if this should prove to be the fact, it is needless to dilate on the intense interest of even such semblance of confirmation of our hopes. Of course, to regard anything which could be so noticed as anything *more*, or as if it could constitute an argument for belief in a future life, would be foolish in the extreme, seeing the great obscurity and the evanescent nature of all such phenomena. Our faith in immortality must be built on altogether different ground, if it is to be of any value as a part of our religion or of our philosophy. But, assuming that we are individually already convinced that the quasi-universal creed of the human race is not erroneous, and that "the soul of a man never dies," we may not unreasonably turn to the solemn scene of dissolution, and ask, Whether there does not sometimes occur, under one or two perhaps of its hundred forms, some incidents which point in the direction of the great Fact, which we believe to be actually in process of realization? According to our common conviction, there is a moment of time when the Man whom we have known in the garb of flesh, casts it aside, actually, so to speak, before our eyes, and

"this mortal puts on immortality." As in Blanco White's beautiful sonnet he is, like Adam, watching his first sunset, and trembling to lose sight of the world, and the question to be solved is, Whether darkness has enshrouded him, or whether

Hesperus with the hosts of Heaven came,  
And lo! Creation widened in his view?

and he may have asked himself,

Who would have thought such darkness lay concealed  
Within thy beams, O Sun? or deemed,  
While flower, and leaf, and insect stood revealed,  
That to such countless orbs thou mad'st us blind?

and Life, like Light, had been only a deception and a veil.

We have walked in company with our brother, perchance for years, through the "wilderness of this world," over its arid plains of toil, and through its sweet valleys of love and pleasure; and then we have begun to climb the awful Andes which have always loomed before us at our journey's end, their summits against the sky, and beyond them—the Undiscovered Land. Onward, a little before us, as chance may decide, our companion perhaps mounts the last acclivity, and we see him slowly approach the mountain's crown, while our lagging steps yet linger on the slopes below. Sometimes, ere he reach the hill-top, he is enveloped in cloud, and then we see him no more; but again, sometimes he remains in the full sunlight, and, though distant from us, and beyond the reach of our voice, it is yet possible for us to watch his attitude and motions. Now we see him nearing the summit. A few steps more, and there must break on his vision whatever there may be of the unknown World beyond—a howling wilderness, or a great Pacific of joy. Does he seem, as that view bursts on him—whatsoever it may be—does he seem to be inspired with hope, or cast down with despair? Do his arms drop in consternation, or does he lift them aloft with one glad gesture of rapture, ere he descend the further slope, and is lost to our sight forever?

It appears to me that we may, though with much diffidence, answer this question as regards some of our comrades in life's journey, who have gone before us, and of whom the last glimpse has

been one full of strange, mysterious, but most joyful promise. Let us inquire into the matter calmly, making due allowance both for natural exaggeration of mourning friends, who recall the most affecting scenes, and also for the probable presence of cerebral disturbance and spectral illusion at the moment of physical dissolution.

Of course, it is quite possible that the natural law of death may be that the departed always sink into a state of unconsciousness, and rather dip beneath a Lethe than leap a Rubicon. It is likewise possible that the faculties of a disembodied soul, whatever they may be, may need time and use, like those of an infant, before they can be practically employed. But there is also at least a possibility that consciousness is not always lost, but is continuous through the passage from one life to another, and that it expands, rather than closes, at the moment when the bonds of the flesh are broken, and the man enters into possession of his higher powers and vaster faculties symbolled by the beautiful old emblem of Psyche's emancipated butterfly quitting the shell of the chrysalis.<sup>1</sup> In this latter case there is a certain *prima facie* presumption that close observation ought to permit us occasionally to obtain some brief glimpse, some glance, though but of lightning swiftness and evanescence, revealing partially this transcendent change.

In a majority of deaths the accompanying physical conditions hide from the spectators whatever psychological phenomena may be taking place. The sun of our poor human life mostly sets behind an impenetrable cloud. Of all forms of death the commonest seems to be the awful "agony," with its unconscious groans and stertorous breath. The

dying person seems to sink lower and lower, as if beneath the waters of an unfathomable sea; a word, a motion, a glance, rising up at longer and longer intervals, till the last slow and distant sighs terminate the woeful strife, and the victory of Death is complete. When this is the mode of dissolution it is of course hopeless to look for any indication of the fate of the soul at its exodus; and the same holds good as regards death in extreme old age, or after exhausting disease, when the sufferer very literally "falls asleep." Again, there are deaths which are accompanied by great pain, or delirium, or which are caused by sudden accidents, altogether hiding from our observation the mental condition of the patient. Only in a small residue of cases the bodily conditions are such as to cause neither interference with, nor yet concealment of, the process of calm and peaceful dissolution, in the full light of mental sanity; and it is to these only we can look with any hope of fruitful observation. We ask: Whether in such cases instances have ever been known of occurrences having any significance, taken in connection with the solemn event wherewith they are associated? Does our forerunner on the hill-top show by his looks and actions—since he is too far off to speak to us—that he beholds, from his "Peak in Darien," an ocean yet hidden from our view?

I should hesitate altogether to affirm positively that such is the case; but, after many inquiries on the subject, I am still more disinclined to assert the contrary. The truth seems to be that in almost every family or circle, questions will elicit recollections of death-bed scenes, wherein, with singular recurrence, appears one very significant incident, namely, that the dying person, precisely at the moment of death, and when the power of speech was lost, or nearly lost, seemed to see something—or rather, to speak more exactly, to become conscious of something present (for actual sight is out of question)—of a very striking kind, which remained invisible to and unperceived by the assistants. Again and again this incident is repeated. It is described almost in the same words by persons who have never heard of similar occurrences, and who suppose their own experience to be unique, and have raised no theory upon it, but merely consider it to be "strange," "curious," "affecting," and nothing more. It is invariably explained—that the dying person is lying quietly, when suddenly, in the very act of expiring, he

<sup>1</sup> There is an insect, the Lunar Sphinx Moth, which exhibits, in its first stage, not only the usual prevision for its security while in the helpless chrysalis state, but a singular foresight of its own requirements when it shall have become a winged moth. Having made, by eating its way upward through the pith of a willow, an appropriate hiding-place, it finds itself with its head in a position in which, were it to become a moth, it could never push itself down, and escape at the aperture below. The little creature accordingly, before it goes to sleep, laboriously turns round, and places its head near the entrance, where, as a moth, it will make its happy exit into the fields of air. There seems something curiously akin in the unaccountable foresight of this insect, of a state of existence it has never experienced, and the vague and dim sentiment of immortality, common to mankind since the days of the cave-dwellers of the Stone Age.

looks up—sometimes starts up in bed—and gazes on (what appears to be) vacancy, with an expression of astonishment, sometimes developing instantly into joy, and sometimes cut short in the first emotion of solemn wonder and awe. If the dying man were to see some utterly-unexpected but instantly recognized vision, causing him a great surprise, or rapturous joy his face could not better reveal the fact. The very instant this phenomenon occurs, death is actually taking place, and the eyes glaze even while they gaze at the unknown sight. If a breath or two still heave the chest, it is obvious that the soul has already departed:

A few narrations of such observations, chosen from a great number which have been communicated to the writer, will serve to show more exactly the point which it is desired should be established by a larger concurrence of testimony. The following are given in the words of a friend on whose accuracy every reliance may be placed:

"I have heard numberless instances of dying persons showing unmistakably by their gestures, and sometimes by their words, that they saw in the moment of dissolution what could not be seen by those around them. On three occasions facts of this nature came distinctly within my own knowledge, and I will therefore limit myself to a detail of that which I can give on my own authority, although the circumstances were not so striking as many others known to me, which I believe to be equally true.

"I was watching one night beside a poor man dying of consumption; his case was hopeless, but there was no appearance of the end being very near; he was in full possession of his senses, able to talk with a strong voice and not in the least drowsy. He had slept through the day and was so wakeful that I had been conversing with him on ordinary subjects to while away the long hours. Suddenly, while we were thus talking quietly together, he became silent, and fixed his eyes on one particular spot in the room, which was entirely vacant, even of furniture; at the same time a look of the greatest delight changed the whole expression of his face, and after a moment of what seemed to be an intense scrutiny of some object invisible to me, he said to me in a joyous tone, 'There is Jim.' Jim was a little son whom he had lost the year before, and whom I had known well, but the dying man had a son still living, named

John, for whom he had sent, and I concluded it was of John he was speaking, and that he thought he heard him arriving; so I answered:

"'No. John has not been able to come.'

"The man turned to me impatiently and said, 'I do not mean John, I know he is not here, it is Jim, my little lame Jim; surely you remember him?'

"'Yes,' I said. 'I remember dear little Jim who died last year, quite well.'

"'Don't you see him then? There he is,' said the man, pointing to the vacant space on which his eyes were fixed; and when I did not answer, he repeated almost fretfully, 'Don't you see him standing there?'

"I answered that I could not see him, though I felt perfectly convinced that something was visible to the sick man, which I could not perceive. When I gave him this answer he seemed quite amazed, and turned round to look at me with a glance almost of indignation. As his eyes met mine, I saw that a film seemed to pass over them, the light of intelligence died away, he gave a gentle sigh and expired. He did not live five minutes from the time he first said 'There is Jim,' although there had been no sign of approaching death previous to that moment.

"The second case was that of a boy about fourteen years of age, dying also of decline. He was a refined, highly educated child, who throughout his long illness had looked forward with much hope and longing to the unknown life to which he believed he was hastening. On a bright summer morning it became evident that he had reached his last hour. He lost the power of speech, chiefly from weakness, but he was perfectly sensible, and made his wishes known to us by his intelligent looks. He was sitting propped up in bed, and had been looking rather sadly at the bright sunshine playing on the trees outside his open window for some time. He had turned away from this scene, however, and was facing the end of the room, where there was nothing whatever but a closed door, when all in a moment the whole expression of his face changed to one of the most wondering rapture, which made his half-closed eyes open to their utmost extent, while his lips parted with a smile of perfect ecstasy; it was impossible to doubt that some glorious sight was visible to him, and from the movement of his eyes it was plain that it was not one but many objects on

which he gazed, for his look passed slowly from end to end of what seemed to be the vacant wall before him, going back and forward with ever-increasing delight manifested in his whole aspect. His mother then asked him, if what he saw was some wonderful sight beyond the confines of this world, to give her a token that it was so, by pressing her hand. He at once took her hand, and pressed it meaningly, giving thereby an intelligent affirmative to her question, though unable to speak. As he did so a change passed over his face, his eyes closed, and in a few minutes he was gone.

"The third case, which was that of my own brother, was very similar to this last. He was an elderly man, dying of a painful disease, but one which never for a moment obscured his faculties. Although it was known to be incurable, he had been told that he might live some months, when somewhat suddenly the summons came on a dark January morning. It had been seen in the course of the night that he was sinking, but for some time he had been perfectly silent and motionless, apparently in a state of stupor; his eyes closed and his breathing scarcely perceptible. As the tardy dawn of the winter morning revealed the rigid features of the countenance from which life and intelligence seemed to have quite departed, those who watched him felt uncertain whether he still lived; but suddenly, while they bent over him to ascertain the truth, he opened his eyes wide, and gazed eagerly upward with such an unmistakable expression of wonder and joy, that a thrill of awe passed through all who witnessed it. His whole face grew bright with a strange gladness, while the eloquent eyes seemed literally to shine as if reflecting some light on which they gazed; he remained in this attitude of delightful surprise for some minutes, then in a moment the eyelids fell, the head drooped forward, and with one long breath the spirit departed."

A different kind of case to those above narrated by my friend was that of a young girl known to me, who had passed through the miserable experiences of a sinful life at Aldershot, and then had tried to drown herself in the river Avon, near Clifton. She was in some way saved from suicide, and placed for a time in a penitentiary; but her health was found to be hopelessly ruined, and she was sent to die in the quaint old workhouse of St. Peter's at Bristol. For many months she lay in the infirmary literally perishing piecemeal of dis-

ease, but exhibiting patience and sweetness of disposition quite wonderful to witness. She was only eighteen, poor young creature! when all her little round of error and pain had been run; and her innocent, pretty face might have been that of a child. She never used any sort of cant (so common among women who have been in refuges), but had apparently somehow got hold of a very living and real religion, which gave her comfort and courage, and inspired her with the beautiful spirit with which she bore her frightful sufferings. On the wall opposite her bed there hung by chance a print of the lost sheep, and Mary S., looking at it one day, said to me, "That is just what I was, and what happened to me; but I am being brought safe home now." For a long time before her death, her weakness was such that she was quite incapable of lifting herself up in bed, or of supporting herself when lifted, and she, of course, continued to lie with her head on the pillow while life gradually and painfully ebbed away, and she seemingly became nearly unconscious. In this state she had been left one Saturday night by the nurse in attendance. Early at dawn next morning—an Easter morning, as it chanced—the poor old women who occupied the other beds in the ward were startled from their sleep by seeing Mary S. suddenly spring up to a sitting posture in her bed, with her arms outstretched and her face raised, as if in a perfect rapture of joy and welcome. The next instant the body of the poor girl fell fell back a corpse. Her death had taken place in that moment of mysterious ecstasy.

A totally different case again was that of a man of high intellectual distinction, well known in the world of letters. When dying peacefully, as became the close of a profoundly religious life, and having already lost the power of speech, he was observed suddenly to look up as if at some spectacle invisible to those around, with an expression of solemn surprise and awe, very characteristic, it is said, of his habitual frame of mind. At that instant, and before the look had time to falter or change, the shadow of death passed over his face, and the end had come.

In yet another case I am told that at the last moment so bright a light seemed suddenly to shine from the face of a dying man, that the clergyman and another friend who were attending him actually turned simultaneously to the window to seek for the cause.

Another incident of a very striking character occurred in a well-known family, one of whose members narrated it to me. A dying lady, exhibiting the aspect of joyful surprise to which we have so often referred, spoke of seeing, one after another, three of her brothers who had long been dead, and then apparently recognized last of all a fourth brother, who was believed by the bystanders to be still living in India. The coupling of his name with that of his dead brothers excited such awe and horror in the mind of one of the persons present, that she rushed half senseless from the room. In due course of time letters were received announcing the death of the brother in India, which had occurred some time before his dying sister seemed to recognize him.

Again, in another case a gentleman who had lost his only son some years previously, and who had never recovered the afflicting event, exclaimed suddenly when dying, with the air of a man making a most rapturous discovery, "I see him! I see him!"

Not to multiply such anecdotes too far—anecdotes which certainly possess a uniformity pointing to some similar cause, whether that cause be physiological or psychical—I will now conclude with one authenticated by a near relation of the persons concerned. A late well-known bishop was commonly called by his sisters, "Charlie," and his eldest sister bore the pet name of "Liz." They had both been dead for some years when their younger sister, Mrs. W., also died, but before her death appeared to behold them both. While lying still and apparently unconscious she suddenly opened her eyes and looked earnestly across the room, as if she saw some one entering. Presently, as if overjoyed, she exclaimed, "Oh Charlie!" and then after a moment's pause, with a new start of delight, as if he had been joined by some one else, she went on, "And Liz!" and then added, "How beautiful you are!" After seeming to gaze at the two beloved forms for a few minutes, she fell back on her pillow and died.

Instances like these, might, I believe, be almost indefinitely multiplied were attention directed to them, and the experience of survivors more generally communicated and recorded. Reviewing them, the question seems to press upon us: Why should we *not* thus catch a glimpse of the spiritual world through that half-open portal wherein our dying brother is passing? If the soul of man

exists at all after the extinction of the life of the body, what is more probable than that it should begin, at the very instant when the veil of the flesh is dropping off, to exercise those spiritual powers of perception which we must suppose it to possess (else were its whole after life a blank), and to become conscious of other things than those of which our dim senses can take cognizance? If it be not destined to an eternity of solitude (an absurd hypothesis), its future companions may well be recognized at once, even as it goes forth to meet them. It seems indeed almost a thing to be expected, that some of them should be ready waiting to welcome it on the threshold. Is there not, then, a little margin for hope—if not for any confident belief—that our fondest anticipations will be verified, nay, that the actual experience of not a few has verified them? May it not be that when that hour comes for each of us which we have been wont to dread as one of parting and sorrow—

The last long farewell on the shore  
Of this rude world,

ere we "put off into the unknown dark"—we may find that we only leave, for a little time, the friends of earth, to go straight to the embrace of those who have long been waiting for us to make perfect for them the nobler life beyond the grave? May it not be that our very first dawning sense of that enfranchised existence will be the rapture of reunion with the beloved ones, whom we have mourned as lost, but who have been standing near waiting longingly for our recognition, as a mother may watch beside the bed of a fever-stricken child till reason re-illuminates its eyes and with outstretched arms it cries, "Mother?"

There are some, alas! to whom it must be very dreadful to think of thus meeting on the threshold of eternity, the wronged, the deceived, the forsaken. But for most of us, God be thanked, no dream of celestial glory has half the ecstasy of the thought that in dying we may meet—and *meet at once*, before we have had a moment to feel the awful loneliness of death—the parent, wife, husband, child, friend of our life, soul of our soul, whom we consigned long ago with breaking hearts to the grave. Their "beautiful" forms (as that dying lady beheld her brother and sister) entering our chamber, standing beside our bed of death, and come to rejoin us forever—what words can tell the happiness of such a vision? It may be

awaiting us all. There is even, perhaps, a certain probability that it is actually the natural destiny of the human soul, and that the affections, which alone of earthly things can survive dissolution, will, like magnets, draw the beloved and loving spirits of the dead around the dying. I can see no reason why we should not indulge so ineffably blessed a

hope. But, even if it be a dream, the faith remains, built on no such evanescent and shadowy foundation, that there is One Friend—and he the best—in whose arms we shall surely fall asleep, and to whose love we may trust for the re-union, sooner or later, of the severed links of sacred human affection.

## LEONARDO DA VINCI.

BY MARGARET FIELD.

THE Castello di Vinci, in the Val d'Arno, was the birthplace of Leonardo da Vinci, whom Von Humboldt called the greatest physical philosopher of the sixteenth century, who, as architect, sculptor, painter, poet and musician, was almost without a rival. He constructed canals, raised immense fortifications, built bridges, tunneled, and indeed removed mountains, deepened harbors, made flying and swimming machines, compasses and hygrometers, and various mechanical implements of lesser value.

He was the pride of Andrea del Verocchio, who taught him painting, and the rival, in every branch of the fine arts, of Michael Angelo. Leonardo as a painter was full of sensibility and imagination; he delighted in expressing with his brush all the finest emotions of the soul. His choice of subjects was always of the highest and purest type, and it was almost impossible to satisfy him with his own works, many of which he destroyed, because they fell short of his ideal.

But all that he achieved was surpassed by the exquisite fresco of "The Last Supper," upon which he worked sixteen years. It was painted

LEONARDO DA VINCI.

for the Duke of Milan, Ludovico Sforza, who was his admiring and most appreciative patron, upon the walls of the Dominican monastery of the Church of Santa Maria della Grazia, where what remains of it is still to be seen on the walls of the Refectory. It is sadly decayed and defaced, having been broken away, and sustained much other injury from ill usage during the occupancy of Italy by the French

troops, at the close of the last century, although Napoleon gave very explicit directions for its careful treatment. But slight conception can be attained now of its original beauty, before which men bowed in reverent homage and wept. We have called it a fresco; but though this is the popular idea in regard to it, it is not a fresco, but was executed with distilled oils upon the dry plastering of the wall, by a process invented by Leonardo himself. This is the chief cause of its decay, as great pieces of the plastering peel off as from any other wall attacked by damp or other causes.

Although "The Last Supper" is the greatest evidence of his surpassing genius which has come

down to us, it was the fruit of only one of his many acquirements. He was one of the most accomplished men of his age, remarkable for the beauty of his face, which is described as marked by the most intellectual characteristics; his carriage was exceedingly graceful, and his bearing noble and courtly. His strength was so remarkable he could twist a horseshoe with his fingers and break a coin in two in the palm of his hand. His conversational powers were of the most brilliant sort, and his scholarly attainments were remarkable.

He is described as so bright and joyous that his childish friends, of whom he owned an host, almost worshipped him; he used to make all kinds of curious toys with which to entertain them; he even tamed a sort of lizard, for which, by the aid of some preparation of quicksilver, he made wings, which were so real and lifelike when the creature moved as to deceive old as well as young. He made his funny pet, horns, a beard, and painted circles around its eyes, giving it such a terrifically fiendish appearance as to make people fly in fright at sight of it.

He was induced to leave Florence and live at Milan, by Ludovico Sforza, whom he charmed in the first place by his wonderful musical ability; he constructed a silver lyre of remarkable and original character, which crowds eagerly assembled for the privilege of hearing him play upon. He sang the loveliest songs—the music and words of which he had himself composed. He extemporized both music and poetry to the delight of all who listened. He excelled in eloquence, and was quoted by the most astute minds of his time as one of the most finished and ornate orators. Some of the most splendid hydraulic engineering done at that period of the world's history was designed by him and executed under his immediate superintendence

for the improvement of Milan. He constructed the famous aqueduct which supplies Milan with water, called Mortesana, by which the river Adda is brought over two hundred miles to the city.

His most celebrated pieces of sculpture are his San Tommaso in Orsanmichel at Florence; a horse in the Church St. John and St. Paul at Venice; and three statues cast in bronze by Rustici, which he modeled for the Church of St. John at Florence. And this wonderful man—painter, sculptor, architect, poet, man of science, leader in belles-lettres, elegant and accomplished scholar and gentleman, distinguished for his remarkable mechanical knowledge—was equally celebrated for his military acquirements and aptness in all sports and feats of skill. Ludovico of Milan, had coveted him, and won him from Florence by his splendid offers, charmed by his music; and Louis XII. of France, delighted by his unrivaled feats of horsemanship, by the wonderful skill and ease with which he managed and subdued the most ungovernable horses, strove on his visit to Milan, 1479, at which time Leonardo was the chief ornament and attraction in his entertainment by the Duke, to tempt him by every promised offer of honor and advancement to leave Milan and become the chief acquisition of the French court; but in vain. However, though he resisted these offers, in 1520 Leonardo visited France, prevailed upon by the urgency of the then King Francis I., but his health was very frail, and the King came frequently to Fontainebleau to visit him. One day lying upon his couch when the King was announced, Leonardo arose to receive him, but falling forward in a swoon, was caught in the royal arms. And thus pillowed, the soul of this gifted man went out, and Leonardo da Vinci was henceforth but a memory.

## A DEDICATION.

By ALGERNON C. SWINBURNE.

THE sea gives her shells to the shingle,  
The earth gives her streams to the sea;  
They are many, but my gift is single,  
My verses, the first fruits of me.  
Let the wind take the green and the gray leaf,  
Cast forth without fruit upon air,  
Take a rose-leaf and vine leaf and bay-leaf  
Blown loose from the hair.

The night shakes them round me in legions,  
Dawn drives them before her like dreams;  
Time sheds them like snows on strange regions,  
Swept shoreward on infinite streams;  
Leaves pallid and sombre and rudely,  
Dead fruits of the fugitive years;  
Some stained as with wine and made bloody,  
And some as with tears.

## NOTES AND QUERIES.

**Longevity.**—In your August number you give a case of family longevity. A family in this place excels the one given so greatly that I am induced to send the record for insertion.

John Breese, of Barnard's Township, Somerset County, New Jersey, married Dorothy Riggs; died there and was buried at Baskingridge Presbyterian Meeting-House. They had a son Samuel, who moved to Wyoming in 1789, who had nine children. The ages of each of the persons mentioned are as follows:

John, died 4th March, 1803, aged . . . . . 90  
Dorothy, died 23d November, 1803, aged . . . . . 90

Their son:

Samuel, died 21st July, 1837, aged . . . . . 80

His children:

Willis, died March, 1854, aged . . . . . 73  
Daniel, died 1865, aged . . . . . 82  
Mary, died 21st December, 1871, aged . . . . . 86  
Lot, died 1st May, 1868, aged . . . . . 81  
Ezra, died 28th June, 1869, aged . . . . . 79  
Elizabeth, died 22d October, 1871, aged . . . . . 79  
John, yet living, aged . . . . . 82  
Henry, died 21st October, 1875, aged . . . . . 78  
Samuel, died 13th December, 1875, aged . . . . . 73

Total for twelve persons. . . . . 973

Average, 81 years.

There are a number of isolated cases of longevity in this vicinity worthy of mention:

Charles Harris, died 24th March, 1864, aged 96 years.

Henry Courtright, died about same time, aged 97 years.

Matthew Phoenix, died 22d August, 1873, aged 107 years, 7 months and 13 days.

Mary Dymond, died 1874, aged 104 years and 3 months.

Elizabeth Jacobs, died 6th December, 1843, aged 105 years and 6 months.

Margaret Larch, died 1848, aged 104 years.

From 80 to 95 is no uncommon age to live to. There are a number of persons in this neighborhood now between these ages, one of whom bids fair to overrun 100.

S. JENKINS, *Wyoming.*

**A Curious Legend.**—The Nerbudda and the Soane, or Sona, are two important rivers of Judea; the former springing from a well near a pagoda upon the highest table land of the mountain called Omerc-handace. This temple is devoutly venerated by all faithful Hindoos, and many pilgrimages made to it with offerings for the goddess Bhavâue, who is worshipped under the symbol of the Nerbudda River. The images in the temple represent her engaged in cutting off the nose, ears, lips, and otherwise disfiguring her slave, Jubilla, while slaves on every hand prepare a marriage feast. The fables which these illustrate form a devout part of the Hindoo belief.

The legend is, that Sona, a god, was wild for the love of

the great goddess Nerbudda, whose reputed beauty had enraptured him. At first scorning his embassies of love, she at last consents to become his bride, and makes great preparations for the nuptials. As he nears the mountain of Omerc, upon whose summit is her castle, he is met by Jubilla, her slave, a beautiful girl, herself in love with Sona. Attired as a queen she presents herself to him, and he, accepting her, receives her as his wife. But the honeymoon is interrupted by Nerbudda, who prepared to receive him, grows restive at his delay, and goes forth to meet him. Enraged when she discovers them together in a cave in which they have taken up their abode, she tosses Sona over a precipice, and he flows on forever—a river. Then with her own hands she mutilates the beautiful face of the girl, who becomes a tear, and bubbling up in a hollow, grows at last into a well, which overflowing its brim, steals softly down the mountain side, a beautiful silvery rivulet, until springing into the embrace of the Sona, it glides united with that river ever towards the sea.

M. F.

**A Strangely Beautiful Custom.**—Do you know the story of the "Diamond Bird," the tiny, crimson-breasted warbler? Well, listen then! Born of the amber-tinted cloudlets of a ruby morn, and of the sea-foam, it is laid in the hearts of the glowing Lotus flower down deep within the solemn glooms of an Eastern forest. And there it lies from moon till moon absorbing into itself the perfume of that flower-heart safe within its velvet nest; while overhead the azure dome glows and wanes, now sapphire, crimson, violet, then intensest blue, gemmed everywhere with worlds. The Bulbul singing love-songs to the rose and lily is the harshest sound it hears; until the full time having come, it soars aloft, seeking the duty for which it had its being. Ah! would that to our hearts the meaning of creation was so plain.

Sometimes in Russia, amidst the glitter of snowy pinnacles and ice-encrusted homes, it finds its abiding place. They call it the Bird of Paradise and deem it a messenger straight from the celestial realms. When a girl is wedded, her bridegroom gives her, as his earliest nuptial gift, this sparkling Diamond Bird. And forever after it becomes the guardian of her honor, the incorruptible witness to the sanctity of the marriage vow between the man and wife. If into the innermost nature of the young wife there steals so much as a shadowy resemblance of an unloyal or unwise fancy, the song of her birdling falters and fails. If led astray and bewildered by admiration and false vows, the little throat ceases its warbling and its crimson turns to violet. Then as the sin goes on and increases, because not destroyed at first, but left to grow, the little silent throat deepens from violet to purple, through all the gradations, until it is black as the sin it bears witness against. If the wifely faith be assailed, the Diamond Bird pines and languishes with pitiful moans. And if, alas! the lamp of truth lighted at the marriage altar in the name of God is quenched in darkest crime, the sorrowful

watcher, hiding its stricken head beneath its wing, quietly and silently dies.

How would it be if the bird fanciers of our American cities were to import these guardians of faith and honor into our midst? Would our fair matrons wear them as their chiefest ornaments on breast and brow, fearless of the silent record of this tender songster, to which deeds, not words, bring death? Who shall tell what its fate would be—how long its life!

**The Eccentricities of Genius.**—The world often wonders why it is that those men and women who dedicate their lives wholly to authorship, literature, art, or science, are in their manners and habits so odd and *peculiar*, as contrasted with those engaged in other occupations. Is it because their genius or inventive power makes them oblivious to current events and customs? The greatest characters in the field of literature have won distinction for their eccentricities. They seem to shine as stars in the firmament for a little while and then we behold them in the gloom of despondency—dull and melancholy. One hour buoyant and entertaining to friend and stranger; another, morose, peevish and disagreeable. Indeed, there appear such irregularities and uncertainties in the practical life of the great body of those who make books for the multitude to gather instruction and amusement from, that the writer with many friends would feel thankful for any information that would illuminate the matter. The effects are visible, and there must be causes perfectly rational for what appear to many of us as vagaries and freaks of fancy in men and women of recognized genius. Could not the Editor of *POTTER'S AMERICAN MONTHLY*, throw a little light upon the subject? V. R. M.

Information is much easier solicited on this subject of character, or rather causes of character, than furnished. Curious to the world at large—and we might almost say a mystery—are the operations of the human mind and heart. We cannot penetrate the inner-temple, and see thought and emotion. We only can witness the external movements and their results. True, there are those who seem to be able at times to fathom even the thought of others. The eye is said to be an index to the soul, and he who can read that aright may know even the operations going on in the mind.

The causes for such eccentricities are no doubt traceable to influences external or internal, which we have not the power of discerning. These influences are as changeable as the mind itself; and this change would seem as one of the necessities of a literary life. The thinking and exploring mind takes always great delight in new mental excursions and scenes, and appears to feast on variety, as the spice of mind-life. During the period of these ramblings into the new and unknown realm the outer world is lost sight of, and only the new creations are lingered upon. This isolation from a normal to what might be called an abnormal condition would as a logical result, produce one or more evidences of the *peculiar*, or eccentric. This deviation from the simple rule in word and act, is the *strange* in literary characters.

Some writers have considered these peculiarities as the infirmities of genius. With them we do not agree. There is no more evidence of such acts indicating weakness, than superlative acts and measures in other directions performed

by other men showing infirmities. Burke says "a vigorous mind is as necessarily accompanied by violent passions as a great fire with great heat." Consistency to the outward life may at intervals disappear, and acts resembling frailty take its place; but does this drifting against the tide of human actions in general demonstrate feebleness? The more thoughtful will rather be disposed to look at it like Burns:

"Miled by fancy's meteor ray,  
By passion driven,  
But yet the light that led astray  
Was light from Heaven."

"It is seldom the lot," says Madden, "of the wayward child of genius to have a Currie for his historian, and hence it is that frailties, which might have awakened sympathy, are now only mooted, to be remembered with abhorrence. It is greatly to be regretted that eminent medical men are not to be met with qualified, by literary attainments, as well as professional ability, for undertakings of this kind. No class of men have the means of obtaining so intimate a knowledge of human nature, so familiar an acquaintance with the unmasked mind. The secret thoughts of the invalid are as obvious as the symptoms of his disease: there is no deception in the sick chamber; the veil of the temple is removed, and humanity lies before the attendant, in all its helplessness, and for the honorable physician it lies—if we may be allowed the expression—in all its holiness. No such medical attendant, we venture to assert, ever went through a long life of practice, and had reason to think worse of his fellow-men for the knowledge of humanity he obtained at the bedside of the sick. Far from it; the misintelligence, the misapprehension, that in society are the groundless source of animosities which put even the feelings of the philanthropist to the test, are here unknown; the only wonder of the physician is, that amidst so much suffering as he is daily called to witness, human nature should be presented to his view, in so good, and not unfrequently in so noble, an aspect. It is not among the enlightened physicians of this or any other country that we must look for the disciples of a gloomy misanthropy."

There is a sort of charm around and about the *sanctum saniam* or *insaniam* of genius which leads many to walk in its footprints. Swift, Sharpe, Tasso, and Cooper took special delight in this field of labor, although their violons were considered distempered. There are many instances of minds depraved, not so much from excessive study, as from protracted broodings over unpleasant subjects. This twisting of the faculties into tortuous channels cannot fail to give us *eccentricities*, but it does more—furnishes the world with certain kinds and degrees of insanity. Festus told St. Paul that much learning had made him mad; and Sophocles has lauded the beatitude of ignorance. The wise course is the middle course. Temperance in literature, as in all things, should be the guiding principle. "When the growth of intellect," says Madden, "is too prompt, its faculties are too early developed, and mental application is permitted proportioned to this development; the body receives no part of it, but the nerves cease to contribute to its energies; the victim becomes exhausted, and eventually dies of some toxicomania malady." During the transition from the one state to the other, many of the so-called peculiarities are witnessed.

Surveying the subject from different positions we are led to the conclusion that order, uniformity and law should guide all human operations. Too great a strain upon any faculty or function will recoil to the injury of him or her who makes it. We may advance to the gate of the temple of celestial knowledge, yet we should know the boundaries which human science cannot pass.

If we glance at the closing scene of many men who gained the admiration of the world through their productions, we will find much to illustrate our observations: Addison once said to a prodigal young nobleman, "Behold with what tranquillity a Christian can die!" Roscommon repeated on

his death-bed two lines of his own version "Dies iræ." Bede quit life in the act of dictating. Keats, just previous to his death, in answer to a question as to his condition, replied in a subdued voice, "Better, my friend, I feel the daisies growing over me." The ruling passion in life generally lingers till the light goes out. Man, however, notwithstanding all his imperfections, is a wonderful creation. In reason, how noble! In faculties, how infinite! In form and motion, how grand and graceful! In intelligence, how like Jehovah! To lift him up on to higher planes, and enable him to achieve greater possibilities, is the mission of human brotherhood. Let us hope for its success.

## CURRENT MEMORANDA.

**The Trade Problem.**—Intimately connected with the Capital and Labor problem is our relation with adjoining countries and governments, and the interchange of their products with those of the United States. In a former number of the MONTHLY we briefly outlined the benefits which would be derived from extending our intercourse in a manufacturing and commercial sense with Mexico and other adjacent States. The weakness of the cry of *over-production*, we felt sure, would soon be apparent to all, if once we utilized the opportunities offered us. We are told that "there is a tide in the affairs of men which, taken at the flood, leads on to fortune," and no less truthful is it when applied to nations. This tide has for many years borne millions of dollars across the Atlantic to enrich the merchants and Government of Great Britain, and just because we have been blind to our best interests. To find markets for our cotton manufactures and other products is to find employment to labor now idle, and capital now stored away in bank vaults. As bearing directly upon this subject we extract the following from the *Philadelphia Record*:

The Centennial Exhibition has proved wonderfully fruitful in opening new avenues of trade, and it is probable that the fame of Philadelphia manufactures thus disseminated over the civilized world will create demands from quarters heretofore unnoticed. It will be remembered that a society was formed, composed principally of public men, to advance American industries. That association now reports a large number of export orders from sections entirely new, and will show, on the authority of some of the best business men in the city, that the export of our manufactures is practicable in almost every department, and entirely successful in all cases that have been tried, the goods being sent and paid for here without any speculation whatever.

As an outgrowth of that movement a more specific organization has been effected by twenty leading business firms to open up the trade with Mexico, Central and South America, among whom are conspicuous, Messrs. Jessup & Moore, William Cramp & Sons, Collins & McLeester, Henry Disston & Sons, Martin Landenberger & Sons, Lloyd, Supplee & Walton, Stephen F. Whitman & Son, Sausser, Son & Co., John Gibson's Son & Co., W. L. Elkins & Co.,

Loper Brothers & Co., Hale, Kilburn & Co., and James Long, Brother & Co. They have aided in the formation of a general agency under the firm name of Fralick, Murphy & Co., in this city, which has arranged to create corresponding agencies in all the leading cities of Central and South America, representing in each case a sufficiently large assortment of goods to secure a fair business to every such agency.

The parties to this arrangement are under a specific contract which secures permanence and makes the effect as strong as the united strength of the houses concerned can make it, representing not less than \$20,000,000 of capital.

"No such organized effort has been made in any previous case," said a gentleman recently, thoroughly acquainted with the export interests of the country. "This proceeding places Philadelphia in advance of New York, Boston or St. Louis, each of which has made some considerable effort to open this trade. The parties believe it will result in the early establishment of steam lines of communication, and will secure to Philadelphia its rightful place in this immense Southern trade."

"There are now \$60,000,000 worth of cotton goods consumed in South America, nearly all of which has previously been sent there by England. It is now found that American cotton goods are not only much cheaper, but best suited to the uses of all those countries, and the same preference exists for almost everything in our ordinary range of manufactured goods."

"A gentleman received this morning," continued our informant, "an order for 1,200 dozen glass tumblers from Rio Janeiro, South America. It is only necessary to open communication with those countries to inaugurate a very large trade, for the simple reason that Brazil and South America have been supplied for years with the poorest of English cottons, their clumsiest tools and most inferior machinery of every sort. The only thing necessary to give Philadelphia entire possession of the market is to go there and open up proper agencies to represent us."

**Capital and Labor.**—For want of space in our last issue, we were obliged to break off rather abruptly our remarks

upon Capital and Labor. We continue the discussion from where the thread was broken, trusting that the interest awakened in the September number will be more fully compensated in this.

The principal causes for the reduction of the prices of labor are the following:

1. Selling wares or commodities at *non-paying* profits.
2. Extravagance in the style of living.
3. Mismanagement of business.
4. Falling off of the amount of sales.
5. Withdrawal of capital from business.
6. Shrinkage of the values of investments.
7. Decrease of consumption.
8. Surplus of production.
9. Surplus of labor.
10. Increase of the purchasing power of the dollar.

It becomes our duty, then, to inquire, how far the laborer should *uncomplainingly* bear the effects of any one or all of these causes. If the manufacturer or merchant sell his goods, or railroad companies transport freights at *non-paying* profits, in order to compete with or break down his or their rivals, is a *reduction* of wages justifiable to *make up* the losses sustained in such a struggle for supremacy? This question touches the heart of the recent railroad trouble. The war between the railroad companies growing out of their desire to control the bulk of the carrying-trade of both property and person, has entailed heavy losses, which have been made to recoil—unjustly, we think—upon the operatives of the road. A fair and equitable competition may be wholesome, but that which is productive only of injury, should be everywhere and at all times severely condemned. Competition as practiced for the last decade has been the *death* rather than “the life of trade.” “WE DEFY COMPETITION” is the drawing card in the merchant’s window. The spirit it displays is born of deception and cradled in dishonesty. Its reward is either gain unfairly won, or bankruptcy. If neither of these, the wreck of the merchant is only saved by the discharge of the employé, or the curtailment of his salary.

The *SECOND* in our table of causes for the reduction of the prices of labor, is extravagance in the style of living. If the business man consume his working capital by excessive opulence and expenses uncalled for in the natural order of comfort and happiness, is he justified in repleting his exhausted treasury by contracting the daily or weekly compensation of the diligent worker in his employ? An affirmative answer to this is certainly not tenable. The same principle applies to the *THIRD* cause, *i. e.* mismanagement of business.

We next come to consider the *FOURTH* source of trouble, the falling off of the amount of sales. This may be the result of one or more causes: Not advertising judiciously the business; not keeping pace with the new ideas current, and the wares and fashions of the day; lack of business courtesy (an important element of success in trade); or a want of demand for goods, after exhausting all due attention and diligence to the business. The responsibility in this is more of a complex character than in the first, second, or third causes before named. Here, no blame, directly, may rest upon the employer. If he reduce the wages of his clerk, or workmen, as the sequence of his losses, superinduced by no neglect of his, but general falling off of trade, he is morally and legally in-

nocent. Should the loss and reduction come entirely from neglect of his business, the capitalist, in this case, would be *guilty* from a moral standpoint, in so far as others are made to suffer through this violation of their—the employes—trust in him. He would be, however, according to the usual interpretation of our civil laws, entitled to full liberty to manage his own business, according to his own will. Right here we need reform. We should have our laws so framed that the *moral law* would be their spirit and foundation.

The other six causes for the reduction of the prices of labor: withdrawal of capital from business, shrinkage of values of investments, decrease of consumption, surplus of production, surplus of labor, and the enhanced value of the purchasing power of the dollar, are, in the main, on the side of the monied capitalist. Reduction of wages predicated upon any one or more of them is generally *justifiable*, and should cheerfully be acceded to by every reasonable employé. More than this, it should be the spirit of Labor to sympathize and coöperate with Capital suffering from any of these causes. The removal of them can only be accomplished by concord and coöperation.

Now, in order to bring about the required reforms, and at the same time stay the growth of anti-democratic principles, the masses, while obeying the law and all duly constituted authority, should labor as a unit together.

From our definition of labor or capital uncrystallized, it will be readily inferred that the *right* to unite in brotherhoods and trades-unions is inalienable and belongs to every man who can justly claim citizenship. The liberty to exercise this right is also specially declared in the Declaration of Independence, as a fundamental principle of a free government, and this principle is clearly laid down in our *GREAT NATIONAL CHARTER*; yet there are many that claim to be public guides who ignore this right, and practically deny the power to exercise it.

The same right is guaranteed to the laborer to centralize his labor-capital, that is accorded the monied capitalist in the organization of banks, insurance, railroad, and other forms of joint stock companies. This union is the strength of monied capitalists, and only through it can their power and influence be wielded in gigantic and effective form. So great has this power become that legislators, both State and National, and even courts of justice have been made creatures of their dictatorial will. This concentrated power sometimes has been used for the public weal, but more frequently has its force been directed for individual aggrandizement, at the expense and to the injury of the laboring classes.

To check these encroachments upon personal rights and liberties, the labor capitalists of the country must exercise their equal rights, and organize, not into a few local unions, but into one broad, general brotherhood, national in its character and equitable in its object. This *NATIONAL LABOR-CAPITAL UNION* could have as many State and district subdivisions as the respective occupations require, each with its local officers, with local government, while subject, in a degree, to the deliberations of the National Council. The doctrine of Communism in these societies should be specially excluded. All influences of a sectarian or political nature should be zealously guarded against. The motto “a fair

day's work for a fair day's wages," might take definite shape in a schedule of certain standards of prices for certain qualities of services. "JUSTICE TO EMPLOYER AND EMPLOYEE" should guide the members in all their counsels and actions. The will of a large majority of the people of the several States could be manifested through such Unions, and such laws be made as would best promote the interests of the whole people.

It may be here asked, What will alleviate the suffering population? We answer, that there are many remedies which to us seem practicable. Chief among these is the recognition by the monied capitalists of the rights of the laborer. "Not how little can I secure his services for, but *how much can I afford to pay him*," as expressed by an eminent manufacturer of New England, must be the spirit of the managing powers. This sort of policy would yield its own reward: for just in proportion to the amount of disbursements to the labor-market, so is the business augmented in all the mercantile and commercial markets. If A pays out \$100,000 more this year than last, \$100,000 more is put in active circulation by the labor recipients, and A, with the rest of the community, shares in its benefits. He sells more to his employes, and more to those who provide food, clothing, and shelter for his workmen. The reverse of this policy has, in no small degree, brought about the general shrinkage of business.

Another way by which relief could be obtained, is the commencement of National, State, and City improvements that would enhance the value of the public estate, while furnishing employment to many now on the verge of starvation. The General Government might open up new highways across the Continent, take into its hands the construction of a Southern Pacific Railway, and complete the Northern Pacific Road. There are also many harbor improvements sadly needed. There are millions of acres of new land, needing only settlers to open and cultivate. If proper aid and encouragement were given to thousands of those now idle, tides Westward and Southward would soon set in, and new life would be given to what now are forests and prairie wilds. Homesteads would soon be seen scattered as blossoms of civilization, in regions long known only to the buffalo and wild man of the forest. The productive industry thus utilized would augment the national wealth in such a ratio that it would pay the Government to give to each settler one hundred and sixty acres of land, free transportation to it, and a supply of provisions for six months. Retrenchment of expenses is all right in certain directions, but it is no retrenchment to discharge a *faithful* worker, only to support him in idleness. A wise and beneficent Government should make the happiness and prosperity of its people its chief concern. The "penny wise and pound foolish" policy is crippling all forms of exchangeable values.

The paying off of the national debt and restoration of specie payments are not near as important to the whole country as the utilizing of the labor capital, now yearning for something to do.

How this can best be accomplished is a subject for the consideration of Congress and the Government. It seems to us that some system could be easily devised by which this utilizing of the now unmarketable labor capital could be made productive. As an adjunct to the Department of the

Interior, it would be no difficult matter to establish a NATIONAL LABOR BUREAU, under the management of a chief, the same as the Bureau of Education, the object of which would be to gather all information possible bearing upon capital and industry, and the devising of ways and means to best promote the productive industry of the nation. This bureau, being confined in its sphere of usefulness mainly to the labor and capital problems, would be fully competent to make such recommendations to Congress for its action as the real facts warranted.

Among the needed reforms is the revision of our National Banking Law, by taking from it the feature which *gives a premium of about six per cent. in gold* to the banker, more than is now allowed on mortgages and other forms of security. In ordinary business, among business men, if A borrows from B \$10,000, and give for security a first mortgage on his (A's) property, B, the lender, expects to *receive* say seven per cent. interest on the bond he now holds against A. Under the banking law, the Government, who is the lender to the banker of his circulating medium in the form of currency, with its (the Government's) indorsement thereon, really receives not one cent for the loan, as B does in business, but the Government (corresponding to B) *actually pays to the banker* (corresponding to A) six or more per cent. on the bonds deposited for security. This is radically wrong, as it imposes an unjust tax upon the people. In a period of war such a law was, perhaps, made a necessity; now it should be abolished.

Another reform necessary is the repeal of the law under which *the Government stamps its depreciation* on the national currency, by discriminating what it shall and shall not pay for: "This note is a legal tender at its face value, for all debts public and private, *except duties on imports and interest on the public debt.*" The words we have italicized make the distinction and consequent depreciation. The Bank of England note is not depreciated in any such manner, and the result is it passes at par with gold all times and places.

A third reform is called for, and that is the remonetization of silver in such quantities that it and gold shall form a basis of values to regulate all other values that are interchangeable.

The present generation has already liquidated a large portion of the public debt, and should it not be equally incumbent on those who succeed us to contribute their share of the cost of preserving and perpetuating the blessings of a free government, which they will enjoy? The value of a government, like that of a commodity, is measured by what it costs, and he who shares in the country's expenses is more likely to inquire into its workings and needed reforms than the *free* recipient of its favors. This is an accepted truth, demonstrated by the experience of societies, ecclesiastical and secular. Responsibility in any form tends to create a better type and style of citizenship. The man who is at the head of a family generally makes a better citizen than he who can roam at will, without restraints or any of the home-burdens to bear. Stability of purpose, frugality and sobriety, in the aggregate is on the side of the married population of the country. This condition of life should be encouraged, and in no better way can this be done than by rewarding those who settle upon our great public domain.

## LITERATURE AND ART.

**Sumners' Poems:** By SAMUEL B. SUMNER and CHARLES A. SUMNER. New York: The Authors' Publishing Company.

The authors and publishers have presented to the public in this book a production which commends itself. It comes to us in very attractive form: a 12mo, 500 pages, heavy tinted paper, prefaced with steel engravings of the authors, and elegantly bound in imitation morocco.

The spirit of the brothers in sending the book out into the world is manifested in the words which mark its DEDICATION: "To the memory of our mother, Pluma Amelia Barsstow Sumner, long since dead, from whose cultured lips we learned our first and best lessons, this volume is affectionately inscribed." The origin of the Poems is best set forth in the Preface: "Written at different periods of our lives, and alternating from grave to gay, will not lack variety at least; and will afford some entertainment, we trust, to all classes of readers. Some pieces may be deemed lacking in dignity or poetic art, many are juvenile compositions, and many are of special local interest; but for reasons which will be obvious, and by advice of those whose judgment we value, we insert them in this collection. Not without timidity, but relying upon the public indulgence, we launch this little venture on the uncertain sea."

We give the *spirit* and *origin*, so to speak, of this collection, that the public may know something concerning the creative sources, that those interested in poetical writings may get an insight of the characters who speak to the world in verse and rhyme in this publication. They can only be fully known and measured after an intimate acquaintance with their thoughts and emotions. These are exhibited in many forms of expressions and shades of meaning.

On page 14, in the poem "THE TRUE LIFE," we read:

"The dearest homage which the soul can show  
To its great Author, is, itself to know,  
Itself to cherish and develop here,  
Its ripening only for a higher sphere.  
As but rehearsing on the stage of time,  
For that grand Drama—awful and sublime—  
When the vast Drop-scene shall be rolled away,  
The glories of Hereafter to display!  
When Heaven's full orchestra their strain begin,  
And the Forever shall be ushered in!"

This stanza shows one style of the brother Samuel, and certainly in all, except the last four lines, exhibits clearness of perception and force of expression. The measure is good, however, throughout. The first four lines show condensed thought and power.

We extract from "PRESENTED AS A SILVER WEDDING GIFT," on page 462, as showing the style of Charles A.

"Full five and twenty years ago—  
Ah, me! what recollections swarm—  
Louisa changed her maiden name  
To please her Francis Maudlebaum."

There is great variety of style throughout the book, and this is one of its values, as the mind does not weary with the

sameness of measure or monotony of expression. The volume will well compensate perusal, and should meet with ready sale, combining as it does much that is brilliant and humorous with that which is patriotic and historic.

**Nimport, of the Wayside Series.** Boston: Lockwood, Brooks & Company.

This is a neat little volume of nearly 500 pages, 16mo, printed on cream tint paper, and bound in cloth. The typographical work is good, and the matter throughout very entertaining. "Nimport," the title of the book, is the name of "a goodly city," and as the author says, "clean, busy, and fair to look upon." The Fonde family, composed of Paul, an artist of noted ambition; Philip, a member of the army, who scorned civil occupations; Margaret and Theodosia, sisters of tender age, and an orphan cousin named Coplestone Crownds, whose age bordered on six. These five characters lived in a three-and-a-half-story brick house, their own estate. In addition to this property they owned a little railroad stock, all of which comprised the estate of the late Andrew Fonde, the father of the two sisters and two brothers. The death of this devoted sire threw the quartette upon their own resources for a livelihood.

This book tells in a most animated manner what these resources were, not as related by a stranger, but with all the spirit of Paul, the senior member of the household. The birth of the book, in the writer's own language, is attributed to "a bunch of old letters written by Peg, and tied up in a bit of green ribbon."

The experience of the several members of the Fonde family in their struggles for what they considered the prizes; the source of happiness and misery, and the ever shifting scenes which confronted them, are presented almost as real as life itself.

In order that the reader may form an idea of the style, we give the following extract from one of Peg's letters: "Dropping the curtain immediately, I sat still and speechless. I would have given worlds to cry out, but was really—laugh at me as you may—quite dumb with fright. After a severe struggle I controlled myself sufficiently to look again. The figure stood as before, but the slight movement I made, in lifting the curtain perhaps, attracted its attention, for, turning, it advanced with long quick strides towards where I sat. My blood now stiffened in my veins! My limbs were paralyzed! I tried in vain to shriek! In abject terror I felt myself swooning, when the apparition spoke; said, in soft, deep, pleading tones:

"Oh, Romeo, Romeo, wherefore art thou Romeo?"

The sound of human voice, speaking intelligent and familiar words, brought me to myself enough to take presently another observation. The figure had retreated from the corner, and was standing as before, in the middle of the room." Throughout the book there is a sort of naturalness that can hardly fail to amuse and instruct.

**Art in the Elder World.**—The earliest records we have of art works are during the reign of Ninus and his queen, the famous Semiramis. She, it is said, caused a bridge to be thrown across the Euphrates, having at either end a castle, the walls and ceilings of which were painted with figures of people and animals; one being a hunting scene in which the queen herself appeared, casting a dart at a panther, while Ninus hurled a spear at a lion.

Contemporaneous with these are accounts of Egyptian paintings; very few, however, for the art of carving, moulding, and sculpture seemed to have the highest place in the estimation of the nation of the Sphinx.

Then comes the Greek Zeuxius, merry old Zeuxius, who is said to have died laughing at the comical picture of an old hag he had just finished. The story of a picture he painted of a boy carrying a basket upon his head in which the grapes were so natural the birds came and picked them, is well known; also that when the people were wild with enthusiasm at the sight he, throwing his brush at it, exclaimed, "If the boy had been well painted, the birds would not have dared to touch the fruit." And when his rival Parrhasius summoned him to decide the merits of his prize picture, Zeuxius, waiting for the curtain to be withdrawn, was amazed to find the curtain was the picture, and with true magnanimity exclaimed, "Thou art the greater; Zeuxius deceiveth birds; Parrhasius, men."

Apelles of Cos and Protogenes of Rhodes are the next whose names appear upon the roll of fame. Pliny relates of them (and declares he saw at Rome the panel upon which they drew before it was destroyed, when the Palace of the Cæsars was consumed) the following story: Apelles, beloved and honored by Alexander the Great, therefore praised of all men, having seen a picture of rare merit, was told it was the production of an artist of Rhodes, unknown, unhonored, and poor. He determined to know and aid the man, and visiting Rhodes found Protogenes absent; leaving word he would return at such an hour, he drew a line upon a panel, but left no name. Protogenes, on seeing it drew another, and absented himself from home at the hour appointed for the coming of the other. When Apelles came he drew a third line, which Protogenes beholding, exclaimed in a rapture: "It is Apelles of Cos, or a god from Olympus."

It is likely these were not simple lines, but rather lined or outlined drawings, like the etchings of later artists, where a few seemingly unimportant strokes tell a whole story. Apelles painted many portraits of Alexander, one as Jove (or Zeims) with the thunderbolts in his hands, which was such a wonderful picture that Alexander issued a decree that no man save Apelles should ever after paint his portrait.

Another, in which the Emperor was mounted upon Bucephalus did not please him so well, when Apelles asked that the horse should be brought to compare him with his portrait; instantly upon approaching it Bucephalus neighed aloud. "See, sire, your steed is a better judge than you."

Another saying of Apelles has become a proverb, the Latin rendering being *ne sutor supra crepidam*, and the story is: Apelles, hearing a cobbler find fault with a sandal he was painting, listened to his reasons for disapproval, and accepted them as correct. The cobbler, delighted by the respect shown his opinions, began to criticise the leg, when

Apelles silenced him with, "Cobbler, stick to thy last; thy judgment goeth no higher than the sandal."

His most famous picture is Venus Anadyomene rising from the sea foam.

It is recorded of Apelles he never painted on walls, or upon anything which could not be removed or be rescued in case of fire, or be carried from place to place. "A picture," he declared, "belongs to no one nation, city, or man, but should be the property of the world."

Of Protogenes, though no painting remains, it is said he was a masterly delineator, but severe, grave and precise in his style, with great accuracy of detail. He used only four colors in his paintings. The only one whose name has come down to us is one in which the foolish Rhodians refused to see merit, until Alexander, having offered an immense sum for it, they eagerly tried to outbid him, and prayed it might remain in Rhodes, which prayer was of course refused. This was a picture of Talysus, the founder of a city of the same name, on the isle of Rhodes. It is said Protogenes was working upon it when the island was taken by Demetrius Poliorcetes.

M. F.

**The Delights and Labors of Literature.**—The remark has frequently been made that "one-half of the world knows not how the other half lives." This applies to the manner of creating or producing the means of subsistence, and the mode of using them. If the same current of thought be extended to literary writers, it may be said with even stronger evidences of truth, that "nine-tenths of mankind know not how the other one-tenth exists." The one part is so shut out or weaned from the multitude that the major portion of the world can only wonder how those who are bound up in thought and the business of making books for others to read get on in their everyday life. The readers are "so near, and yet so far" from the authors, that they are both friends and yet strangers. As strangers, they desire to become friends, and know more intimately of the toils and pleasures of those who have so often made them seasons of real joy, which might have been barren of fruition. While it is not our aim in this brief to unfold the unrevealed lives of the members of the literary world, we propose to give a few incidents illustrative of the delights and the labors of literature.

Literature possesses its solitary pleasures, and they are manifold; it also has its social enjoyments, and they are perhaps more numerous than the solitary. The Persian poet Sadi teaches a moral in one of his apologues. Two friends passing a summer day in a garden of roses, one satisfied himself with admiring their colors and inhaling their fragrance; the other filled his bosom with the leaves, and enjoyed at home, during several days, with his family, the deliciousness of the perfume. The first was the *solitary*, the second the *social* student. He wanders among many gardens of thoughts, but always brings back some flower in his hand. Who can estimate the advantages that may result from this toil and this application of it!

The domestic history of the amiable Cowper, notwithstanding his abiding melancholy, presents us with some placid and even glowing pictures, when contemplated seated on his sofa, rehearsing each newly constructed passage to his faithful Mary Unwin.

## SCIENCE AND MECHANICS.

**Electrical Influences.**—In this day of scientific investigation and research with works on biology and physiology, important and interesting facts are being discovered and developed, and what to the mind in days past was perplexing and unaccountable, is now being made plain, and elucidated upon rational, sound principles. It is a known fact that in a state of sleep the system becomes thoroughly relaxed, and its absorbing power great. Hence, diseases are more readily contracted in sleep than at any other time, and more especially those of a miasmatic kind; and hence, the importance of sleeping high above the ground; as mephitic air rises about fifteen feet as an average, and the importance is manifest of sleeping above that height in all humid climates, and especially in those subject to malarial or miasmatic influences. Thus it is observed, when an epidemic breaks out in a city, that those who live in cellars or on the first floors are more liable to take the disease. The reason is plain: for in sleep the body absorbs the floating disease that is in the air through the lungs and relaxed system. Hence, in high and dry latitudes epidemics are seldom, and are never feared. Thirty feet above the ground is a safe height, but forty is still better, and the higher one gets the purer the atmosphere in the fall season.

It is well known that the human system is full of electricity, and it has much to do with our physical comfort. The same principle holds good relative to human as to other bodies surcharged with electricity, according to their temperaments and perhaps habits. Some are decidedly emissive in nervous force, while others again are absorbent in nervous force. No two such persons should sleep together, for it is life to one and death to the other in time.

There is nothing that will so soon derange the nervous system of a person who emits nervous force during sleep, as to sleep with another who is an absorbent. The absorber will go to sleep and rest quietly all night, and get up in the morning feeling bright and refreshed; while the emitter will be tossing, restless, nervous and excitable, and will get up fretful, peevish, feeling out of sorts and unrefreshed by sleep. Yet not one out of ten thousand will know the real cause of their feelings; they only know that they did not sleep well. No two persons, no matter who they are, should habitually sleep together. One will thrive, grow strong, healthy, and resist disease; while the other will grow by degrees weak, nervous, peevish, and sink unresistingly under disease. It is astonishing that physicians have not given the subject more thought.

Nature never intended that the old and young should sleep together; that is to say, those whose waste is greater than their repair. After fifty, as a general rule, the waste of the human body begins and the repair declines. But in children and those in the forenoon of life, the repair is far greater than the waste. Hence the old would become an absorber, and take from the young some of its force. Grandparents should never sleep with their grandchildren under any circumstances; for the wasting body of the old would keep warm

and absorb the heat and force and health at the expense of the child.

The sick and weak should sleep to themselves, no matter whether children, young folks or old folks. Consumptives should ever have a bed to themselves, for consumption is contagious, whether so declared by medical authority or not. It is not as rapid in its workings as that of small-pox, measles, mumps, etc. A weak, sickly, feeble child should never sleep with one that is just the opposite, unless the object is to keep alive the feeble at the expense of the strong. What is true of children is equally applicable to those who are older, and in all the stages and conditions of life.

**Transmission of Heat.**—Light passes through all transparent bodies alike, from what source soever it may come. The rays of heat from the sun also, like the rays of light from the same luminary, pass through transparent substances with little change or loss. Radiant heat, however, from terrestrial sources, whether luminous or not, is in a great measure arrested by many transparent substances. If the sun's rays be concentrated by a metallic mirror, the heat accompanying them is so intense at the focus as to fuse copper and silver with ease. A pane of colorless window-glass interposed between the mirror and the focus, will not stop any considerable part of the heat. If the same mirror is presented to any other source of heat, however (as, for example, to a red-hot ball), the glass plate will stop nearly all the heat, although the light is undiminished. We thus distinguish two sorts of caloric rays, which are sometimes called Solar and Culinary Heat; and we discover that substances transparent to light are not, so to speak, transparent to heat in a like degree. This property is distinguished from transparency by the term Diathermancy (meaning the easy transmission of heat). It appears that many substances are eminently diathermous, which are almost opaque to light: like smoky quartz, for example. The temperature of the source of heat has the greatest influence on the number of rays of heat which are transmitted by a given screen; as in the case of the glass plate, which permits nearly all the sun's rays to pass, but arrests over sixty-five per cent. of the rays from a lamp-flame.

**Nitro-Glycerine.**—The prodigious explosive energy of nitro-glycerine will be comprehended by an inspection of the accompanying tabulated figures, which give the comparative qualities of a number of the explosives.

	Heat.	Volume of gas.	Estimated Explosive Force.
Blasting powder.....	509	0.173 litres	80
Artillery powder.....	618	0.225 "	137
Sporting powder.....	641	0.216 "	139
Powder, nitrate of soda for its base,	704	0.252 "	150
Powder, chlorate of potassa "	972	0.318 "	209
Gun-cotton.....	580	0.401 "	173
Picric acid.....	687	0.780 "	226
Picrate of potash.....	678	0.565 "	227
Gun-cotton mixed with chlorate of potash.....	1430	0.444 "	680
Picric acid mixed with chlorate of potash.....	1634	0.468 "	692
Picrate mixed with chlor. of potash.....	1422	0.512 "	674
Nitro-glycerine.....	1220	0.719 "	620

## GOSSIP AND NOTE BOOK.

**The Home Circle.**—There can be no doubt that the truest happiness is ever to be found at home. No man without a home can be long and truly happy. But the domestic group can be productive of happiness only when it is assimilated by affection, and kept in union by discreet friendship. Then it tends to produce as much happiness as this world is capable of; and its sweet repose is sought for by all sensible men, as ever by the wisest and greatest.

What can be compared in our intercourse with the attentions of our family—with their exhilarating smiles and undissembled love? All these raise the gentlest and most pleasing emotions, and call forth all the sentiments of uncontrolled nature. What are the raptures of ambition, the pleasures of fame, the delights of honor, in comparison with them? Utterly worthless and insipid.

Hence it is that we see senators and heroes shutting out the acclamations of an applauding world to partake the endearments of family conversation, and to enjoy the prattling of their little children in their harmless pleasures. And these are the purest sources of mirth. They have influences, too, in amending the heart; for innocence is communicating by coming in contact with it; and the sweetest simplicity of children tends to purify the heart from the pollution that it has acquired from moving in the world and mixing with men.

Into what an abyss of moral degradation should we not be sunken were it not for women and children? Well might the great Author of evangelical philosophy have been delighted with the presence of children, and found in them—what He in vain sought among those who judged themselves their superiors—goodness and virtue.

Cicero, with all his liberality of mind, felt the tenderness of home attachment; and at one time he acknowledged that he received no satisfaction in any company but that of his wife, his little daughter, and—to use his own language—“his *honied* young Cicero.”

Sir Thomas More, with his great powers of mind, devoted a great share of his time—because he knew it to be his duty, and felt it to be his delight—to the amusement of his children. Homer in his *Iliad*, in the parting interview between Hector and Andromach, has interested the heart of the reader in his terrible hero, by showing the amiability of his Trojan chief, by depicting him, while standing completely armed for the battle-field, taking off his helmet that he might not frighten his little boy with its nodding plumes.

**A Young lad**, whose teacher is rather free with the rod, remarked the other day that “they had too many hollerdays at their school.”

**The Witchery of Manner.**—Almost every man can recall scores of cases within his knowledge where pleasing manners have made the fortune of lawyers, doctors, divines, merchants, and, in short, men in every walk of life. Raleigh,

as related in history, flung down his lace coat in the mud for Elizabeth to walk on, and got for his reward a proud Queen's favor. The Politician who has this advantage easily distances all the rival candidates, for every voter he speaks with becomes instantly his friend. The very tone in which he asks for a pinch of snuff, are often more potent than the logic of a Webster or a Clay. Polished manners have often made scoundrels successful, while the best of men, by their hardness and coldness, have done themselves incalculable injury—the shell being so rough that the world could not believe that there was a precious kernel within it. Civility is to a man what beauty is to a woman. It creates an instantaneous impression in his behalf, while the opposite quality exercises as quick a prejudice against him. It is a real ornament—the most beautiful dress that a man or woman can wear—and worth more as a means of winning favor than the finest clothes and jewels ever worn.

**Deacon Jones**, just deceased, had a very red nose. His widow thought it rather personal in the funeral discourse, “Another shining light has been taken from our congregation.”

**How to Secure Perfection.**—A friend called on Michael Angelo, who was finishing a statue. Some time afterward he called again; the sculptor was still at his work. His friend, looking at the figure, exclaimed, “You have been idle since I saw you last.”

“By no means,” replied the sculptor, “I have retouched this part, and polished that, I have softened this feature, and brought out this muscle; I have given more expression to this lip, and more energy to this limb.”

“Well, well,” said his friend; “but all these are trifles.”

“It may be so,” replied Angelo; “recollect that trifles make perfection, and that perfection is no trifle.” So also is it with character.

**Penn**, the founder of Pennsylvania, abhorred smoking. His Quaker council one day, observing his approach, laid down their pipes. “I am glad to see,” said Penn, “you ashamed of that vile habit.” “Not at all,” returned a principal Friend; “we only laid them down lest we should offend a weak brother.”

**Ivy Culture in Vases.**—A number of *The Garden* recommends the vase culture of ivy in moss and water for drawing-room purposes. The directions given for its management are as follows: The ivy should be grown in long, opaque glass jars or vases, and it is essential that such vessels should be wide at the top, so that the plants, after being properly rooted, can be taken out and the jars cleaned when necessary. In the selection of ivy for vase culture, long pieces with small leaves are to be recommended. Those

taken from the stems of trees where the points are inclined to be pendant will be found to answer best, such ivy having generally stout stalks covered with aerial roots. Each vase, according to its size, should contain three, four, or five pieces, each piece being rolled up separately, in a small portion of Hypnum or sphagnum moss, the latter being preferable. After this tie all the pieces loosely together in a clump to suit the width of the vase, and place them in it so that the ball of moss does not reach within five or six inches of the bottom. It will be necessary to keep the water in the vase about half way up the moss till the cuttings are properly rooted. From the moss the roots will extend into the water below, and it will be found that those roots produced in the moss and water will be quite sufficient to nourish the plants. Cutting plants whose roots have been produced in soil, if lifted and placed in vases, will ultimately do well; but the probability is that the roots will die and the plants for a time sicken until new fibres are formed capable of enduring moss and water culture. After the ivy is properly rooted, the glass jars may be kept full of water, and sprigs of flowers may also be inserted in them. The water and flowers may be changed when necessary, and even the ivy, whose roots ought now be a solid mass, may also be taken out and replaced at pleasure without injury.

**A Singular Freak.**—A well-known wealthy Parisian has had himself painted, by an eminent artist, "As he was," "As he is," and "As he will be." "As he was," represents him at the age of twenty-five, a poor wretch in ragged garments, with his toes peeping through holes in his shoes—slinking, half famished, by the side of a wall. "As he is," figures him fat and jolly as an alderman, well-dressed, with gold chains decking his waistcoat, and diamond rings blazing on his fingers. And, in "As he will be," he is made a hideous corpse. Not the least singular feature of such a singular freak is the fact that he has the paintings hung in his drawing-room.

**"I Never Thought of That."**—A pastor to a new charge, where the interest of the people in the church had grown lukewarm and the finances low, was advised by a member, as a means of success, to "throw one leg over the desk while preaching." The minister remarked, "I do not see how that would serve the cause of religion;" to which the member replied, "I never thought of that!"

**A Query.**—A little fellow who was worrying over a piece of shad at dinner, demoralized his mother by asking, "Mamma, where did God find all the bones to make the first shad of?"

**The Decade of Talent.**—A philosophical physician has been collecting statistics of mental power, and comes to the conclusion from an analysis of the lives of a thousand representative men as distinguished in the great branches of human effort, that the golden decade of the mental faculties is between thirty and forty, the silver between forty and fifty, the brazen between twenty and thirty, and the iron between fifty and sixty. We hardly realize the superiority in mental power of the younger men, because almost all positions of trust—professorships, high political offices, and the like—are in the hands of the elders. Reputation, like money, belongs chiefly

to the old; but men do not become widely known until they have done the work out of which their fame grows. Original work requires enthusiasm, and enthusiasm is a comparatively youthful quality. If all the original work which has been done by men under forty-five were swept away at a breath, we should well-nigh go back to barbarism. But these are only general notions—and the world is full of exceptions to them. Genius grows old slowly. Age is largely a question of health. Some people are younger at forty than others at thirty; and while the enthusiasm which belongs to youth remains, the work kindled by its warmth need not harden into the cold dullness of age.

**An Incident of the Russian War.**—Among the officers on the Grand Duke's staff is a tall, handsome man, with a lithe, slender, active figure, a clear, blue eye, and a face young enough for a second lieutenant. It is Skobelev, the youngest general in the Russian army, the conqueror of Khokand. He has the reputation, even among the Russians, of being a madman, who would fling away his own life and those of his troops without the slightest regard for consequences. During the war which resulted in the conquest of Khokand, a Russian detachment of eight hundred men, with four hundred Cossacks, was compelled to retreat before a superior force of the enemy. General Trotsky decided upon a night attack, and confided his plan to Colonel Skobelev then his chief of staff. The latter entered into the idea with great enthusiasm, and proposed to lead the attacking column himself, and to take only one hundred and fifty Cossacks. Skobelev, having reconnoitered the ground, perceived that the Khokandians had encamped within a mile and a half of the Russians in an open plain, which gave every facility for the manœuvring of cavalry. At midnight he took his one hundred and fifty Cossacks, divided them into three parties, and cautiously surrounded the enemy's camp. The party, led by Skobelev himself, managed to pass the enemy's outposts, who were sound asleep. Then he gave the signal for the attack by firing his pistol, and, followed by his one hundred and fifty Cossacks, he rode headlong into the enemy's camp of six thousand or seven thousand men, shouting and yelling like fiends, and cutting down everything in their passage. For a quarter of an hour the plain resounded with shrieks and yells, shots, the trampling of horses, shouts and groans, and all the uproar of battle. Then all was silence. Skobelev assembled his Cossacks, and when morning came he found that the whole army of the enemy, six thousand or seven thousand men, had disappeared, leaving on the field about forty dead, two thousand or three thousand muskets and sabres, all their camp materials and baggage. But what was his astonishment on calling the roll to discover that he had not lost a man either killed or wounded!

**Brickmakers die very young,** not because the gods love them particularly, but because theirs is such a kiln business.

**She Presumed he Would.**—"When I die," said a married man, "I want to go where there is no snow to shovel." His wife said she presumed he would.

**Virtue's Reward.**—"Her children arise up and call her blessed; her husband also, and he praiseth her."

## MINNESOTA, OR THE LAND OF LAKES.

BY MARTHA CORNELL WOODWARD.

I.

A RURAL HOME IN MINNESOTA.

### CHAPTER I.

THESE are the gardens of the desert, these  
The unshorn fields, boundless and beautiful,  
For which the speech of England has no name—  
The prairies. I behold them for the first,  
And my heart swells, while the dilated sight  
Takes in the encircling vastness. Lo! the stretch  
In airy undulations, far away!  
As if the ocean, in his gentlest swell,  
Stood still, with all his rounded billows fierce,  
And motionless forever.

In delightful unconsciousness of geographical localities, I left Chicago *via* the Northwestern and West Wisconsin Railways, passing through clean-swept prairie lawns preserved by Nature's beneficent care in primitive loveliness. In the limitless expanse, pictures formed in shaded grains,

hedged in by groves of oaks, made brilliant by the magic of sunlight, dotted the scenery in charming variety. We sped past fields of blossoming clover, whose fragrance penetrated the heavy air with grateful odor. We passed Madison, the capital of Wisconsin, and admired the pretty lakes by which it is environed, though unable to take in the town by even a birds-eye glimpse. We rushed on into the day's future faster and faster, in my ignorance I knew not whither, until (do not be shocked) we brought up at Devil's Lake—incongruously and with utter disregard of the euphonistic fitness of things, so called—for refreshments. We sat, during those twenty minutes, overshadowed by ledges of rocks, from which, centuries ago one must infer, great blocks

of stone had become detached and lay piled one upon another down the whole declivity of its hundreds of feet. The track is cut along the shore of this (as it is believed) bottomless lake, whose peculiar dark and sombre color would seem typical of that bourne to which it is feared some of us are wending; though, for the comfort of timid souls, I can say that it is not so bad, viewed from a standpoint of safety, and that they have only to take heed to their ways to enable them to pass on to green pastures.

Still, I can imagine that suddenly, when the judgment prepared for the wicked shall come, this gloomy lake might become illumined with flames, and that these massive blocks of stone might be wrenched from their foundations, falling upon the bodies of sinners already seething in flames of boiling waters beneath. Impious imagery like this has haunted the

brains of fanatics in past ages, and still tinctures our dreams of God's justice; and here, amid this phenomenon of volcanic eruption, these old superstitions might well seem verified in reality.

For miles on, mountains of ledged rocks overhang deep, narrow streams, assuming varied forms of architecture. Towers, castles and turrets loom up in distinct and artistic proportions at unexpected intervals, filling the fancy with visions of the wild and romantic adventure of olden times. Huge trees are twisted like reeds into the very heart of rocks, suggestive of the mighty upheavals and convulsions of nature in the centuries lost to tradition. Gradually, rocks and sandstone assimilate in modified degrees. Black earth and white sand lay side by side in marked distinctness, as if streaked with the soil of the antipodes. One views these facts of nature, which outrival dreams of the imagination, with awe and wonder.

Farther on the track passes through dense woods of pine. The gentleman of color who had charge of the sleeping-car, patronizingly remarked that it was fortunate we should pass through them in the night-time, as they were dark and gloomy; and as it proved that the night was also dark and impenetrable, nothing could be distinguished. I know that the surroundings looked sombre enough by the morning's light, which developed heavy clouds and rain, through which I noticed some straggling pines, whose tops I was unable to distinguish from the

car window. Therefore, I conclude that the forests of pines through which we passed were of fabulous height, and judged, by inductive reasoning, that their depths were of inexplicable gloom.

Clouds and rain greeted my arrival at St. Paul, where I passed the day in friendly quarters. Next morning, with limited knowledge of the

A RIVER SCENE IN SOUTHERN MINNESOTA.

city, I proceeded by the Northern Pacific Road *en route* for Clear Lake, the sun still lugubriously veiling his face in mist and rain. Oh, inhospitable sun, thus to withhold the light of your countenance from weary sojourners in a strange land!

In consequence of a comfortable, nonchalant slowness on the part of the train, quite out of character with Western enterprise, certainly, I had plenty of time for reflective enjoyment of the scenery, which, however, was somewhat tame, except from its expansiveness, and the awakening sense of one's faculties to reach the far-distant horizon. One feels his own limitations, here on these broad plains. Happy he who joyously reaches out to grasp the grand possibilities shadowed forth in the overstepping boundaries of awakening knowledge!

To my surprise, quite a number of persons occupied the cars whose destination was beyond my

own. I had imagined myself to have reached the extreme limits of safety, and looked upon these adventurers as victims deluded by the baseless chimeras of Western prophecy of gold and precious stones, in the far-off Utopia of their dreams.

At one of the stations, with a village glimmering in the distance, an object was seen advancing at full speed, which proved to be a horse and buggy. The effect was exhilarating, and insensibly appealed to one's sense of poetic beauty. On the broad prairie, this one phantom-like vision swooping down upon us in undulating movements, swift as thought! Two persons occupied the vehicle. One, the lady, floated down from her seat, so it seemed to me; I know there was no mincing or dallying with steps; she was out and in the cars without apparent effort or perceptible motion. After conversing with the friend whom she had come to meet, "she melted as a breath into the wind." For though I was alive to

every subtle change, I do not know how she reached her seat in the buggy. But she was there, and as we passed on, they were seen speeding over the limitless space like birds flying in the air, or like a dream of beauty fading in the morning light. These broad Western prairies are conducive to freedom and grace of movement, it is clear; and the picture was a pretty one.

"The team" awaited me at the station, driven by its proprietress. After looking in upon the grocery and post-office—happily combined in one

—in the face of a cold wind we prepared for our drive over the intervening space of four miles, followed by the dogs Flash and Ned. I determined in my own mind to make friends with these quadrupeds the first thing on my arrival. I am

A LAKE SCENE BY MOONLIGHT.

pretty clear-sighted where my own safety is concerned, and these dogs looked dangerous.

While at St. Paul, I learned that tracks of bears had been discovered in the vicinity of the very house itself. This news, to one conscious of sins of irreverence, together with full knowledge of Scriptural authority for the doom of such, was a startling revelation; and that it behooved me to be on my guard, was terribly apparent.

A cold rain set in which kept us indoors. In despair, we concluded to ignore the weather, and

with anticipations of wonderful discoveries, ventured to the beach in pursuit of agates—a fabulous

stone supposed to have been found upon these shores, but now extinct, though with pathetic credulity still sought after by amateurs like ourselves. Presently, and unexpectedly, a shower coming up, we made an inglorious retreat to the house, with garments limp and

drooping, where now, with satisfactory experimental knowledge of the state of the weather, we patiently await brighter days.

Last night the whip-poor-will repeated his plaint among the trees, in voice of remarkable distinctness. In fact, there was no competition, all well conducted birds being safely ensconced in the domesticity of nests, or left in lonely celibacy, blinking upon the tree-tops. The silence was profound; nothing to distract our attention as an audience, or bias our judgment as "reporters." As an elocutionary performance it was doubtless a success, so far as it went; and as I listened and wondered, I was lost in mazes of doubt as to which was the human, the bird or myself.

Another day. This morning there is a commotion among the denizens of groves. It may be that they are tuning their voices for a grand triumphant jubilee, in honor of the glorious orb of day, now sailing aloft in unclouded splendor, and in whose radiance they will bask in happy unconsciousness all through the summer days. Leaves dance in the sunlight, the swaying branches reveal glimpses of the lake gleaming clear and peaceful in the morning sun. Out-of-door life is becoming delightful reality, where hand in hand with Nature, time will become a myth, days and months will blend in long, restful dreams of peace, free from care. "Sufficient unto the day" will be chanted in soft breezes, and murmured in the rippling sound of waves, sorrow and grief will melt in the cadenced music of eternal symphonies!

But not upon the flitting tourist will gifts like these be lavished. Only to patient worshippers in Nature's haunts, with hearts attuned to her con-

ditions, will divination of her sweet secrets be vouchsafed. We must bring to her shrine offerings of trustful, loving hearts, before we shall receive knowledge of celestial joy; we must become *en rapport* with Nature through aspirations after truth, before we come to our reward and dwell in her courts.

One feels repaid for cold rains and cloudy weather, by this mystical transfiguration of Nature under the great painter's hand. Suddenly, at his royal beck, life becomes superabundant; leaf and bush glow in reflected radiance, flowers with upturned faces blushing receive the gift of beauty; grass springs in vivid mossy green, under the benign influence of his effulgent glance.

Listen! the world of feathered songsters are waking from the torpor to which, with wisdom surpassing the human, they cheerfully submit, awaiting the reactionary processes of Nature, under God's laws, to give them release.

To realize in fullest poetic sense the kingdom of the ornithological creation, one needs to become oblivious of the conditions which surround his grosser nature, and allow his thoughts to hover in mid-air, enwreathed amid the branches upon the swaying tree-top, until insensibly, that subtle mag-

FIELD MICE.

netism which accompanies rhythmic motion, steals away the senses in forgetfulness, and he becomes

lost in the floating existence of these airy inhabitants of winds and zephyrs, and in dreamy con-

HARVESTING.

tentment watches their happy occupation among leaves and flowers "from early morn to dewy eve," verifying the adage by positive knowledge that it is "the early bird who catches the worm," and, by deductive inference, that it is the laggard who labors all the day. One learns lessons of wisdom in Nature's tabernacles: at length he yields himself to a paradisaical state of existence, and revels in the harmonious music of the spheres, while yet, with taint of earth, he catches familiar

intonations in the voice of birds, closely allied to the human.

Listen to the oriole's gushing proclamation of "beautiful creature," addressed, it is probable, to some coy companion of the opposite gender. Nature in these translucent regions allows no intermarriage of races, thereby preserving types of rare and unadulterated individuality. So far as known, no bird has ever yet fallen from grace.

But listen! the world is alive with happy sounds! Who says that the forests are lonely or dull? Sit, I pray

you, for one brief, happy hour, beneath the rustling oaks at Clear Lake enwapt in Nature's

gracious favors! Listen! harmonious modulations fill the air with softest music. One can but exclaim that the day is perfect—a hackneyed phrase, it is true, and one which has already done good service. But then, if it has been many times repeated, we must remember that there have been a few such days within our own experience; days flashing from out the past like brilliants in a dark sitting—as also that printed language dates still farther back, and that the sensations of that period were very much like those produced under similar circumstances in our own. And again, has not the country orator many times announced that language

is inadequate to express his sentiments? Proof sufficient that the fault of repetition lies in the sparseness of language itself! Then one must be truthful at the risk of criticism, and recognize the fact in the barbarous past of pure unadulterated thought, in which we of the enlightened present (as we fondly believe) are but imitators. "There is nothing new under the sun," said Solomon, and

SMOOTH-HEADED.

BEARDED WHEAT.

RURAL SPORTS.

twist and torture ideas as we may into a semblance of originality, the fact remains the same, that they

are but weakened dilutions of some grand old truth, which in trumpet tones has sounded through the ages.

PRAIRIE PHEASANT.

It is true that the city's hum floats in far-off remembrance, and instead, the voice of birds and insects fill the air with sounds of peaceful communion, so far as one can judge from limited observation. Though that there are jars among these breezy occupants of woods, is a possibility I am led to conjecture from indications which have in various ways come to my knowledge. Why, for instance, any sane bird should go shrieking about the woods in frenzied cries of "Kill deer," "kill deer," would seem inexplicable on other grounds than that of petulancy, to say the least of it. One might almost fancy him possessed with murderous intent, and fear that the whole kingdom of birds were in danger from the assassin's beak.

The turtle-dove would seem to be born to an inheritance of sorrow, and in sombre-hued respectability doomed to pass her days in lamentation. "He dwells apart as one bereft," is true of her saddened life. It would seem from observation of her proclivities, that her sorrows have closely allied her to the habitations of men, where she is found in fearless occupancy of barns and lofts, upon which domiciles with generous care have been provided for her, and where she rears her young in lonely withdrawal from her kind.

Thus it is apparent that the conditions which govern the kingdom of birds are as stringent and implacable as those which mark human distinctions.

Problems of Nature's laws have in all ages

baffled philosophers—and in which, for myself, from a standpoint of tranquil repose, I utterly renounce all complicity, as unprofitable and discouraging evidence of one's own limits of thought and discovery; and which, furthermore, I am content to regard under the head of unfathomable mysteries of being. With this recognition of human fallibility, I shall henceforth, in these sketches, dwell only in the apparent, leaving to sages the entangling mazes of speculative knowledge. Enough for me the glory of sunlight, the singing of birds, and the soothing melody which breathes in cadenced music around the path of life.

"Sufficient unto the day is the evil thereof." "Rest, rest from your labors," still floats in choral symphonies among the tree-tops, and dies away in sighing breezes.

#### CHAPTER II.

THE day had been a day of wind and storm;  
The wind was laid, the storm was overpast,  
And, stooping from the zenith, bright and warm  
Shone the great sun on the wide earth at last.

BRYANT.

Events crowd each other in surprising variety beside these placid lakes and upon these quiet plains. Yesterday we barely escaped encounter with a whirlwind, which came with the slow,

WILD PIGEON OF THE WEST.

stealthy mutterings of doom, rolling its thunderbolts over and over, "like a sweet morsel under

the tongue;" chaining the lightning in its grasp, until, with the spring of the panther upon his prey and the hyena's wild shriek, the fury of the elements were let loose, bending the tallest trees to the earth in prompt obeisance. Branches crackle and snap like reeds before its breath, and follow in wild disorder the maniacal wind's dread course. Suddenly, amid the thundering of battalions and the blazing of artillery, there comes a pause of ominous portent. One waits tremblingly for the last trump to sound, or for the conflict to be renewed in still wilder fury; when lo! the battle is over, the wind has spent its force, and dies away in fitful sighs.

The correspondences of human strifes with Nature's convulsions are not dissimilar. Nature but repeats herself in manifestations of man's restless desire for wars and blood-

shed, which only through the divinity of thought rises superior to the whirlwind's fury. Knowledge flows in upon patient seekers like rivers of living waters, gathering with the ages forces which shall in good time blend with the infinite, in grand, eternal harmony.

We stood in awed silence, gazing upon the havoc wrought amid all sweet summer's beauty. What had become of the joyous sound of birds, and of their pretty nests perched in sheltering branches, and of the dainty speckled eggs with which they were garnished? Who could tell of the calamities which this outbreak of the elements had brought upon them? Then came to our consciousness in soothing measure, the words, "He

tempereth the wind to the shorn lamb." True, and at the suggestion, we are irreverently reminded that the lambs are literally shorn. Yonder they cower under the lee side of the barn, victims to worldly gain, while their fleeces lie carefully packed in baskets awaiting disposal at market prices. But that there are wise protective laws in

Nature's courts, I can but believe, since we ourselves have been preserved through whirlwinds of disasters and sorrows.

Presently as we gaze, soft, cooling breezes greet us in renewed covenant of peace, chirpings of birds are heard from unexplored recesses and coverts, past our comprehension of discovery. Sunbeams flick the tree-tops, and dally with the fresh-washed leaves. Soon, the sun in full blaze glorifies the world, calm and unmoved, from his majestic

WESTERN LIFE—PRAIRIE ON FIRE.

course, as if the passionate outbreak of the elements, which for a space obscured his radiance, were but child's play. Detached branches and twigs cover the smooth surface of the lawn. These unsightly objects must be removed, or they will moulder and decay, like dead bodies, before our very sight!

But we are not to be defrauded of our drive, and soon we are speeding through the fresh, lambent air, and over broad plains covered with glittering rain drops. Evidences of the storm are everywhere observable, though fortunately our pathway is not impeded by the fallen trees, which in streaks mark the whirlwind's course. Dismantled trees pathetically rest upon their more fortu-

nate neighbors. One can admire the mighty oak fallen prone and splintered in every limb, while the reclining trees simply awaken pity. We longed to release them from their hapless condition, and give them place upon the broad bosom of mother earth. Prairie chickens are seen, with sudden motion emerging from the tall, damp grass, and the plover's shrill cry is heard in bushy coverts. Tangled thickets dot the plain, where occasional deer lie concealed during daylight, awaiting the protective shadows of night to venture forth in search of food. A week ago, in endeavoring to reach a neighbor's house, we became entangled in the mazes of one of these thickets, and wandered back and forth in helpless bewilderment, at last in our awkwardness surprising a deer ensconced in covert. The surprise was mutual and equally alarming. We stood mute, while with a bound, which in an instant put fathoms between us, he swept the plain upon the wings of the wind.

On our return the sun was fast disappearing beneath the horizon. One never tires of the grand, boundless expanse of Western sky, thus illumined. The soul longs for those far-off boundaries, and thirsts for knowledge hidden beyond the wondrous pageantry of purple and golden clouds which surround in glorious pomp the day's decline.

Tears bedew our eyes, as we ride on in silence, with but occasional chirrup to the horses. Well-known scenery begins to assume strange and weird appearances in the deepening twilight. The moon appears at its full, clear and resplendent. There is a little stir upon our arrival, which soon settles in stillness. We sit and talk of days that are past, in the darkened room, with utterance choked by sad remembrance.

Come out beneath the arch of heaven! Tread softly, hush! If you would know what silence means, look out upon the night. Not a ripple in the air, the tall trees stand straight and motionless as if carved in marble, the lake lies still and glassy as the eye of Death. One hears the very echo of Nature's pulsations in the solemn stillness, and stands motionless, in adoration!

#### CHAPTER III.

HE answered, "Ere long we will launch  
A vessel as goodly, and strong, and staunch  
As ever weathered a winter sea!"—LONGFELLOW.

We have been remembered in invitations to a "raising." In this sparsely populated country,

neighborly kindnesses are cultivated to a high standard of excellence, and nothing is thought of setting aside a half-day to neighborly consideration. Indeed, it is a necessity readily recognized. It is also made a festive occasion, and for weeks is talked of as an event which will herald the neighbors from afar, in friendly converse. We were upon the ground at the precise time specified, not so much that we were needed, as that we liked to be prompt, upon occasions where promptness might be considered a virtue.

It was a large barn which was to be erected. Fifty or more men were already assembled and busily occupied in fitting beams and rafters in their places, under the supervision of a leader, who upon these occasions is unanimously elected to the position.

The farm-house itself lies in close proximity to one of the picturesque lakes with which Minnesota abounds, adding a romantic charm to the plainest dwelling, and affording a pleasing variety to the otherwise tame surroundings. I can imagine that the ownership of beautiful lakes, with facilities for fishing and boating, in connection with broad lands, must add infinitely to one's self-complacency. Almost, I can understand that it is this possibility of proprietorship which gives Minnesota its chief charm. Nature provides her own compensations, and if there is hard labor, and short season in which to garner crops, there is a wonderful fascination in the length, and breadth, and entire individuality of one's possessions.

Tables were set in groves of trees (low scrubby oaks, to be sure), but the best that Minnesota affords; it is said, in consequence of prairie fires, which frequently devastate the plains. Otherwise they might grow to the usual height of oaks, which in the vicinity of dwellings of ancestral antecedents, are handsome and well-grown trees. The tables were in process of ornamentation by the wives and daughters of the farmers present; the scene altogether realizing our most pleasing conceptions of rural pleasures and pursuits.

The dogs Flash and Ned went growling about among the other dogs in a sociable, neighborly way, highly creditable to the occasion; though I could but notice the alacrity with which, as the day drew to a close, they obeyed the roll-call for home; thereby displaying instincts vying with our own intelligent preferences for its shelter.

Our bountiful entertainers are representative Minnesotians. Years ago they had been decoyed from Maine, their native State, by fabulous stories of long life and perpetual youth in this blest land; gifts, which it was represented, would be lavished upon true worshippers of her soil. Bringing with them elements of success in active enterprising habits and sound sense, they had upon the whole, not been disappointed, and are now among the most sturdy adherents of Western life.

Pleasures pursue us. There is to be a picnic of all the surrounding country, in patriotic celebration of the Fourth of July. We are a little doubtful; it is long since we have indulged in dissipations of this kind. Indeed, we particularly enjoy quiet upon these occasions. But we are here—and yes—of course. Firing was heard at an early hour in the morning from the

premises of our nearest neighbor, of two miles distant, which fortunately was softened to an echo before reaching us; and this is one of the advantages of life in Minnesota, that one is so entirely protected by space from neighborly annoyances.

With languid anticipations of enjoyment, though with the fire of patriotism burning in our breasts with steady light, we packed baskets and arranged suitable toilettes for the occasion. Some "bleeding hearts" were growing in the garden, which, in careless admiration of their beauty, I gathered.

When some one remarked that Mr. H——, our very agreeable host of the "raising," also admired them, I suddenly became inspired with the feminine instinct of giving pleasure, my course was decided; I would wear these flowers in my bosom as a delicate compliment to his taste.

Bleeding hearts have been out of bloom long ago, anywhere but in Minnesota, while here they are in their first blush of beauty. One might feel inclined to question the expediency of ever having introduced this flower into the country at all, at the risk of encouragement to shallow freaks of sentimentality. Better have been content with flowers indigenous to the soil, like the gay meadow lily, and the delicate hued harebell, with which the soil is embroidered in rich and varied profusion; or the wild morning-glory, with its clinging tendrils reaching out to clasp the hardy

A CAMP SCENE.

oak with true poetic fervor, than waste one's time on troublesome exotics, however rare and beautiful.

As is usually the case upon these plains, where absolutely no landmarks are visible, we soon became entangled in mazes of doubt as to our locality. We had been directed to Kirby's house as our first turning point. But where, O, where, was Kirby's house? We drove east, west, north and south, with whimsical feminine instincts, pursuing mirages of houses in the distance, inevitably followed by disheartening disenchantment.

Oh, where were these "Isles of the blest," where even then, perchance, the picnic was in full tide of enjoyment? Why had we allowed "the boys" to go around by the lake under pretence of caring for the baskets? Our bewilderment was at its height, my bleeding hearts were sadly drooping in the blazing sun, when, as good fortune would have it, a "ham" was discovered ahead, in which a straw hat was conspicuous, leading us to infer from its dominant carriage, that some strong masculine head was sheltered beneath its brim. This

In silence and wrought up to absolute rigidity of demeanor, we took our observations, and arriving at conclusions, once more made for Kirby's house. Presently, by good fortune, we came upon ground where the grass was bent, as if lately ridden over. With renewed courage we followed on in the trail until, happily, Kirby's house loomed up in the distance, which long sought for landmark, with cheered spirits, we passed straight on to the grove. "The boys" were already upon the ground and wondering at our delay.

THE "GOOD-NIGHT!" AFTER A MOONLIGHT RAMBLE.

was a godsend of which we took immediate advantage, and with confiding simplicity at once fell in line of march, in the comfortable assurance of coming out somewhere.

At this point of my story, I must decry the reader's doubts of my veracity, if the denouement does appear somewhat sensational. I simply relate the circumstances as they occurred, which were, that after following on in good faith in the wake of this, our beacon light, abruptly the team before us came to a stand. The lank, wiry figure beneath the straw hat glared upon us with the announcement that he had lost his way.

We were once more afloat upon the broad prairie rudderless, and with confidence in masculine leadership shattered. Nothing was left for us now but dependence upon our own resources.

The after events of the day will doubtless be correctly reported in the annals of picnics. Sufficient for us the fact, that the Fourth of July was celebrated in due patriotic spirit, upon the broad prairies, and beside the beautiful lakes which gem the soil of this favored land.

#### CHAPTER IV.

COME away, Elves! while the dew is sweet,  
Come to the dingles where fairies meet;  
Know that the lilies have spread their bells  
O'er all the pool in our forest dells.

MRS. HERMAN.

A day of days flooded the world with such delicious temperature as to challenge all historical remembrance of days. To ramble upon the beach in search of "specimens," was like the imagin-

ings of childhood, which invest every stone and pebble in wondrous possibilities. If you would drive, there is indefinable exhilaration in the air. Or, if caring for neither of these, and staying indoors in quiet occupation, or dreamily listening to the wind's soft stir and the song of birds, is preferred, it is equally delightful. I abjure extremes and extremists as discords in the harmony of Nature. To have one's nerves wrought up to fever heat at one moment, or frozen in shivering cold at another, or to come in contact with quarrelsome, combative natures—these are discrepan-

handsome black eyes, and a pleasant smile, under whose spell one's nerves repose in languid enjoyment. One feels poetic in his presence; he inspires one's pen with truthful simplicity of language, to the exclusion of exuberant fancies. These gentle unassuming natures are rare, very rare, now-a-days. In the far-off centuries, when the world was new, one can imagine that conceit was unknown!

The lake was serenely placid, with soft gurgling waves murmuring upon the shore in tenderest plaint, when in full assurance of a strong manly

NIGHT HUNTING ON THE LAKE.

cies to be avoided, if need be, by fleeing to the shelter of woods and plains, where at least the hatchets and cimeters of speech die away in harmless echo.

It was a day like this, in which dreams and reality blended in peaceful contentment. Cares which absorb us in one sphere of life become unreal in another, which doubtless in due time will again congregate about us. But in the interim there is rest and fresh enjoyment.

At sundown we had an appointment, Charley and myself, for an excursion in search of water lilies. Charley is a skilled oarsman. The boat skims the waves like a bird under his hand, and he understands every secret channel and glassy cove about the lake; he knows too where water lilies are to be found. Beside all this, he has

hand at the helm, I stepped complacently to my seat. It was a delicious thought, that even if the boat should sink I was sure to be saved. At rare intervals in a woman's life does she feel a sense of entire protection! We glided with long, even sweeps over the lake. A cloud obscured the face of the gorgeous sunset, casting a peculiar yellow light upon the water, which was reflected upon the trees and grass in strange elfish shadows. With strong, steady pull, we were rapidly nearing the outlet of the lake through a narrow passage, which, like magic, opened upon an equally beautiful sheet of water, called Rush Lake, and for the first time I was made aware of this chain of four lakes, linked together by narrow passages shadowed in dark sittings of trees and foliage, forming in their rambling course, peninsulas and islands

covered with tangled vegetation. In these shaded retreats deer brouse in comparative security through the halcyon summer days, protected from the hunter's shot.

From some height, if such could be found, I can imagine that these lakes might present the appearance of a necklace of diamonds linked together by strings of emeralds.

We rowed in among the lilies, which gleamed white upon the water's surface, cool and refreshed as if surrounded with snow flakes; and gathering them in handfuls, prepared for our return, when, wonderful revelation of elfish malignity, the boat was found to be stationary! While we were plucking the water lilies, these impish dwellers of the water were busily at work winding our oars all about with rushes and lily stems. At last, extricating ourselves from their entangling meshes, we passed safely through the narrow outlet leading into our own possessions. These lakes are known as the Clinton, Rush, Elk and Julia, having an outlet through Elk River, by circuitous route, into the Mississippi.

Letters from the station! One from a gentleman who wishes to pass his vacation in rural sports. It is decided that he comes. He may prove useful in many ways, and it is possible that he may be companionable. He is a gentleman of literary proclivities we learn, a Professor of some science possibly. Literary is a word which covers a good deal of ground, and we are left to imagine almost anything within the range of probability. He is young, so reads our despatch! Youth creates within itself a sense of ownership in the best that is going; youth naturally assumes superiority. The world was created anew with this young man, doubtless. The world is only old, to the old. We have nothing to say against the laws of nature, and happily, we are past solving problems, which occupation we leave to the wisdom of new beginners, while for ourselves we silently take refuge in the simplest theories of life, having absolutely nothing to say of our own researches into realms of the unknown. We have at last come around to the point from whence we started. Many times in our journey we have chanced upon silver ore and dazzling gems, which by strange fatality, soon lost their glitter, and dissolved in mist. The young man will doubtless gather precious gems of thought upon these very plains, with which to enlighten our ignorance.

He will kindly relate his experiences of life, and the conclusions at which he has arrived, in pitying condescension of our commonplace existence. Haply, some good Geni guided his wandering footsteps to these quiet shores!

Quite a large road tax has been brought in by the town officer, who at the same time kindly explained how it can be evaded. It seems that the tax is something of a sham. In the first place there are no roads to be worked, every one choosing a thoroughfare at his own discretion, and with the exception of an occasional bridge, needs no repairing. But the point lies in this. Eastern land-holders, not knowing anything about the soil and its capabilities, and supposing that extensive improvements are in a state of progression, pay their proportion of taxes in money, while people here make a pretence of working out theirs. An Eastern lady owning land here proposed, for some tax levied upon her, to give an acre of land, supposing she was making a munificent offer, when, in reality, this very land upon which she had expended a fortune in taxes, was not worth a song. The story was repeated with an amused, though sad smile, in view of it being an unavoidable piece of deception.

To buy land in Minnesota one needs to be on the ground. He should be a geologist in order to understand the quality and strata of which the land is composed, and to be sure of his depth of soil. Non-professionals would do well to consider before investing in Minnesota lands as a speculative enterprise.

As a place of resort it is all that could be desired. Pure air, smooth plains, and magnificent distances. If, added to these advantages, lakes with boating apparatus enter into one's belongings, it is all that fancy paints. But to the poor, it is hard labor and small gains, compensated by the boon of health, it is true, without which the diamonds of Golconda might be poured at one's feet in vain. A successful grocer at Clearwater, a small town upon the opposite side of the Mississippi, remarked, that he liked these parts very well; said that he had resided here ten years, and had made a fair living. But in answer to our hackneyed question of whether he liked it as well as Michigan, his native State, he guardedly replied that he could not tell until he should have returned there—which in any case was a wise answer.

The ferry over which we crossed—worked by ropes and windlass—looked to my inexperienced eyes a good deal like tempting Providence. Shoals of logs, drifting with the current, proved formidable obstacles to our progress, in some cases, as we were told, occupying hours in dislodgement. Also, the time which was required to arouse the ferryman was decidedly tedious. Altogether, we might have represented disembodied spirits awaiting the movements of the “ancient ferryman,” so far as mortal sound had power to awaken him.

Mr. Wainwright, the young Professor, arrived a week ago. We met him at the station with “the team.” As might have been expected, he appeared remarkably self-assured. His tread was lofty, as if the earth were his servant. A jaunty, springing, peculiarity of manner in ascending and descending declivities, attracted our attention from the first. It was as if these miniature hills had all along awaited his appearance, and of which he, as proprietor, took immediate possession. He looked upon us simply as—well—woman. We might have been Hottentots so far as eliciting anything like surprise or pleasure at meeting us was concerned. We belonged to the human family, no more and no less it was evident, in his eyes. Now, I like my presence, as one of the gentler sex, to be recognized by well-bred suavity of manner. But there was none of this. Sturdy indifference to man or woman marked his bearing. His individuality was clothed in a panoply of mail against unwarrantable intrusion, showing plain as words, that he had come to the country for repose, to shield himself from the world's gaze, and the importunity of ordinary people. Unfortunate young man! Thrice unfortunate hostess!

In his hand was carried a volume of sermons by Edward E. Hale. Doubtless then he belonged to the conservative school of philosophers, who affect such marvelous liberality of sentiment as to methods of thought, magnanimously conceding that there is good in all, Catholics, Episcopalians, Unitarians—and there, with deprecatory accent, they end; precedent can go no farther; and there they halt, and waver between two opinions, like scared school-boys, afraid either to advance or recede—the ghosts of the past, and the shadowy forms of the future proving equally alarming.

But taking this young Hercules for what he is, instead of what we had imagined him to be—a doleful necessity forced upon our acceptance at

every step in life—we find him possessed of many admirable qualities. He wishes to develop muscle, therefore he drives the horses and rows the boat, and does it with a hearty good will. He is not averse to our companionship so far as the mere fact of our presence goes, and with the understanding that his opinions shall be preëminent and unquestionable. With certain reservations, we are obliged to acknowledge that he has good points; impolite and rough, but means well. This is not my version, but the one to which I wisely assent. A certain harmony in the order of things, one cannot help feeling, has been destroyed since the advent of this worldly-minded young man into our Eden. He is suited to the rough and tumble of country life, but lacks the sentiment to appreciate its quiet beauty.

There are persons who through excess of honesty possess an unfortunate capacity for smoothing over difficulties. They have not yet learned the discretionary power of silence. This was the case with Aunt Dee. In her anxiety for this young man's improvement, and in order to palliate some uncomplimentary remarks which she fancied he had divined as connected with his own shortcomings, she unwittingly revealed the truth itself; explaining at the same time, that she had defended him on the ground of extreme diffidence. He laughed at this, as well he might. At last, between explanations and apologies, we were thrown into an inextricable tangle, all owing to Aunt Dee's honesty: the result being that in gloomy dignity, the young man remained within doors, watching with wrapt vision the stars as they appeared one by one, instead of going a-fishing. While we were until long after dark guiding our bark to shore, in the difficult endeavor of preserving our one big fish as trophy of success, we missed the Professor's strong hand sadly. Is it possible that he is predestined to become a necessity, and that the time will come when we shall regret his absence?

The Professor called up the stairs this morning that there was to be a land-slide, I thought he said—he has a fashion of clipping his words at all times, which is apt to mislead one. I rushed out in haste, fearful of being too late for this anomaly of a land-slide upon a level plain, when I found that it was a land-sale, or rather a grass sale, which was about to take place at the barn. Minnesota, at the organization of its government, wisely set aside a portion of land as a school and

university fund, the grass growing upon these unappropriated lands being sold yearly at auction sale for its benefit. The auction commenced at ten, after the sixteen men who constitute the township had arrived. It was an informal affair, so far as parliamentary rules were concerned. The buyers lounged about in easy attitudes, diligently whittling, or sat upon bins and boxes in desultory conversation. The wagon seat was courteously placed upon the floor for our occupancy, opposite a map which had been marked out with chalk upon the barn door, dividing the sections into halves and quarters, giving a reality to the transaction which otherwise would have been wanting. There is nothing like having matters of business in black and white. I think it was this vividness which inspired me with the idea of bidding in a

quarter section, which I did; commencing with the sum of twenty-five cents and running up to fifty-five, at which point I became a proprietor in Minnesota soil. The Professor also bid in a quarter section at twenty-five cents. He facetiously gave his name as Brown, which will doubtless be found so chronicled in the archives of auction sales at Clear Lake.

Some land was pointed out to us a few days after, said to be similar to our purchase, on which not a vestige of grass was visible—nothing but prairie weeds. Perfidious Minnesotians, thus to ensnare the stranger within your gates!

Later, may be found recorded the fact of a munificent transfer of grass upon quarter sections 16 and 17, Y, 35, R 29, to the poor, Clear Lake, under the signature of one Brown.

## THE WRITINGS OF GEORGE ELIOT—THEIR MERIT AND INFLUENCE.

By J. R. HASKINS.

### IN TWO PARTS.—PART II.

ALMOST sacrilegious as were the motives which prompted Gwendolen to marry Grandcourt, yet were they blameless when contrasted with the deeds of Mrs. Glasher, who had abandoned husband and child for a life of infamy. It seems contrary, then, to the general principles of justice, to make Gwendolen the holocaust to her ultimate triumph. Indeed, it naturally suggests a moral obliquity upon the part of George Eliot that is apt to evoke an invidious comparison as to her own independence of social and sacred obligations.

This author always is happy in preserving the unities, but nowhere in this work has she struck more euphoniously the harmony of opposite tones than in the blending of the lives of Deronda and Mira. She is the very antithesis of Gwendolen. Listening to the simple pathos of her life's experience, recalls the mournful wail of her lost sisters, when they *sat down by the waters of Babylon and wept*. We feel that the angels of Jacob and the guardian of Tobias were guiding her pure, ingenuous soul, as she fled from shame and woe unutterable. As a general rule, the works of George Eliot are pervaded by an intellectual seriousness which precludes the idea of that essential adjunct

to all genius—humor. But in this work she has endowed the erratic Hans Myrick with this gift, and it sparkles like a ripple from out the life of "Uncle Toby."

As finely delineated as is the personnel of Deronda, he yet strikes us as rather automatic. The stranger in London would not be apt to recognize him among the visitors to the Jew's quarter, as they would be sure to hear and see Audley Gogerton in Parliament, Harley L'Estrange in his saunterings in Hyde Park, with Nero at his side, or smile as he meets Micawber, standing at the window of some gay show, casting a smiling glance upon the passer-by in hope of "something turning up."

There are dashes in this book that in grandeur and picturesqueness are marvelously antique. Semiramis, in all her barbaric splendor and passionate nature, looms up in the mother of Deronda, and we need neither the rhythm of Euripides, the solemn choral chaunt of the Eumenides, or the tragic interpretation of a Siddons or a Rachel, to thrill and move more effectually one's inmost soul. She stands with uplifted arms, her haggard yet still beautiful face gleaming with long pent-up

emotion, wrapped in the prismatic robes of her princely rank, a living impersonation of the direful consequences that follow upon the greed of ambition, and the insensate craving of mere earthly achievements and rewards, at the sacrifice of the purest affections and noblest deeds. "Some deeds seem little more than interjections, which give vent to the long passion of a life."

The paramount and serious defect in the writings of George Eliot is the pantheistic spirit that pervades them. Apart from her *laudate* upon Judaism, there is not a sentence in *Daniel Deronda* that has any special religious significance, or that can bear any construction of a belief in the revealed doctrines of the Christian Church. "Books that give no recognition of religion are stones rather than bread." There is no occasion for a profession of faith, or the expression of those *cant* platitudes which so many *soi disant* religious writers consider the full equivalent of both. Religion may permeate a book as it pervades a life; its loftiest inspirations work silently, and in the innermost citadel of the soul, as an effulgent halo may be reflected from an invisible light, or like the subtle perfume that greets us from the far distant flowers. Hence, however deep the interest or exalted the moral sentiment of a work, yet without a ray from Thaleor, it is like a sky void of sun or stars.

Seneca and Virgil<sup>1</sup> inculcate a morality quite as exalted as can be found in *Daniel Deronda*; and Plato and Socrates proclaimed a creed as lofty and a hope as everlasting. She speaks of emotion and sentiment as "the savor of life." Under the old cultus of Roman faith, before the Grecian Mythology with its sensuous dogma and corrupting influences had taken root, the people acknowledged the sway of a supreme and immutable Power. "The thought of a God," says Ozanam, "and remembrance of the dead were as two rays unkindled by philosophy, but proceeding from a higher source, with capacity of still guiding, after the lapse of ages of pagan darkness, some chosen spirits in the right way." The principles of the Neo-Platonists, as propagated by Platinus, might even now teach George Eliot a religion quite as elevating as her own tenets. Wherein is her "all Good," her "Invisible," her "Universal," as

prototypes, more omnipotent than the *Universal Soul*, the *Logos* of this ancient creed? ever struggling to reach and grasp the Truth, yet perishing, because devoid of an immortal principle.

It is truly sad to see a mind so nobly gifted, so equal to the loftiest attainment of truth, yet so dark to the paramount interests—the one thing necessary. In this she has retrograded; for her earlier works, though never defined upon this vital point, are yet not deficient in a reverential recognition of divine truths. The prize we travel in distant lands to seek, has long perhaps been waiting at our own threshold to be garnered. The wisdom that we wearily search for in mighty tomes or from the lips of world-renowned masters, may drop from the lips of a little child, or glint upon us from out the daily life of one of earth's lowliest sons. God chooses the little and weak ones of the world to confound the strong. If Mrs. Lewes ever receives grace to realize the force and verity of this axiom, she may find the travail of the intellectual struggle commuted to the ease and light of inspiration.

We never read a work of George Eliot's without recalling the sad fate of the gifted Charlotte Brontë—the one to walk over hard shards and burning sands, and yet to fall foot-sore and heart weary so early in the race; the other to press only flowery plains and win the victor's prize. Had Charlotte Brontë lived, Mrs. Lewes would undoubtedly have found a competitor for her laurels. Of the two, we think the largest genius was with Charlotte Brontë. The harvest that George Eliot has garnered is the product of a naturally strong intellect, that has been nurtured to its highest development. She has enjoyed the widest opportunities in study, culture, travel, and the association and influence of the best minds of the age. Charlotte Brontë's life, on the other hand, had been as secluded and sombre as the purple heather of her own Yorkshire Moorlands; mingled with ceaseless heart-trials, and the leveling drudgery of domestic affairs. Her reading was circumscribed from necessity, and her social surroundings uncongenial. Hence her works were the result of an interior conflict, an irrepressible genius, that levels with a sweep all barriers. In addition to these considerations, we must remember that Mrs. Lewes had attained her full maturity before "Adam Bede" was written, whilst Charlotte Brontë was still quite young when she produced "Jane Eyre."

<sup>1</sup>Virgil's Fourth Eclogue was ranked by the early Fathers of the Church among the Prophets and Sybils.

We remember well the excitement over the question of sex, that the respective appearance of these works elicited, and the majority favored the genuine claim of the masculine *nom de plume*, both being so far in advance of any previous feminine effort in the same plane. This controversy rather tends to weaken Dr. Brownson's assertion that "there is certainly a sex in literature. The difference between the conversation of a man and a book written by a woman, is as marked as the difference between a book written by a man and that of a woman. The characteristics of the feminine mind are stamped on everything a woman writes."<sup>1</sup> This may be a safe rule, especially if the good doctor judges from his own leonine standpoint. But I doubt if even his standard might not have been puzzled to decide this question, if presented in some anonymous articles of Harriet Martineau, Mrs. Somerville, or even of George Eliot. Dr. Brownson belongs emphatically to that old school which believes in the entire subjugation of woman in all things, beyond the sphere of domestic life. Hear him, ye advance guard! "We object to the influence of woman as the creators of popular literature, because the literature they create tends to emasculate thought, to enervate the mind, and to foster a weak and watery sentimentalism, or a corrupting sensationalism." Again: "The most corrupt periods of history are precisely those in which woman's influence is greatest; and we may say, woe unto any age or people where the women bear rule. They can be harder-hearted, more despotic, more cruel, and less scrupulous in effecting their purposes than men."<sup>2</sup> This is sweeping and not altogether in accordance with the blunt doctor's usual logic. Neither can it entirely stand upon historic proofs. But we cannot now pursue his views further, but must revert again to the original subject.

Reference has been made to the "Spanish Gypsy," and we propose before closing this article to say a few words for the benefit of those who may never have met with a work published so long ago as 1868. It has been said in England that Mrs. Lewes considered poetry as her *forte*, and that her disappointment over the reception of this, her favorite brain-child, was deep and bitter. Yet it elicited the warmest praise from the leading

critics, and its transient favor must be attributed more to the supineness of a coterie, than to any deficiency of merit in the work itself. This same spirit, alternating in rapid transition from praise to indifference, was also exemplified upon the appearance of several other works. Bayley's "Festus," Alexander Smith's "Life Drama," Mrs. Browning's "Aurora Leigh," Morris's "Jason," and Robert Browning's later metaphysical problems, which he styles poems; all of these were greeted upon their first appearance as voices from Parnassus, yet have been quite as rapidly consigned to comparative obscurity. If there is any inherent life in a work, it will never fall into total oblivion. Justin McCarthy, who is a good judge of the English pulse, says, speaking of the "Spanish Gypsy": "It is a true, and a fine poem. I believe it to be the greatest story in verse ever produced by an Englishwoman." Again: "No woman has written anything of the same kind to surpass it; and no man in our day has written novels which excel those of George Eliot."<sup>3</sup>

In her prose works, however, the sentiment of love is never clothed in the glowing colors of a ruling passion. With her, the intellect controls the heart, and feeling is ever subservient to judgment. But all this we find reversed in this, her only poem; and as an exponent of ardent love it has been rarely equaled. Every chord of the keynote is struck, from its purest, most harmonious inception, combining the highest degrees of self-sacrifice, the annihilation of all, either personal or sacred considerations, clutching the fiercest depths of wild despair. The truth, sublimity, and deep pathos of this life-controlling power has found its loftiest development, and floats upon us in the tones of a grand antiphonal hymn, which hurtles throughout one's pulses in the full-toned music of this "Spanish Gypsy." The dulcet rhythm of Castilian poesy is therein made subservient to the sonorous roll of the purest English, and the author of this antique gem, framed in a network of new gold, may be classed with the sacred few who bear the inspiration of

"Divinity within them, breeding wings  
Wherewith to spurn the earth."

Every sentiment teems with the weight of a golden grain; each character moves with genuine life, and the sorrow which separates and scars two hearts,

<sup>1</sup> "Brownson's Quarterly Review," July, 1875. <sup>2</sup> Ibid.

<sup>3</sup> "Modern Leaders." By Justin McCarthy.

touches a chord in our own that transmutes the ideal into a living, palpitating woe.

An epitome may prove of interest to those who have never seen this work. As is usual with all Gypsy tales, a stolen child is the inception; but the rule is herein reversed. Instead of the heir to a coronet being carried off by those marauders, it is the royal heiress of the Gypsy king who has been abducted.

The grouping in the opening scene reminds us of those peopled-pictures which the vivid genius of Raphael was so fond of delineating. In her analysis of the mighty throes and stirring events, big with fate, that spring from the absorbing passion of two lives, George Eliot has herein transposed the old rule, which involves self-sacrifice, home, friends, religion, honor, and alas! too often even virtue itself, all freely and unscrupulously offered at this dazzling shrine by woman. With her love is a worship whose god demands the fullest meed of sacrifice and libation. How many may say with the Gypsy heroine, Fedalma,

"I stepped across the cracked earth  
And knew 'twould yawn behind me,"

and yet walk unflinchingly on to her doom of scorn or dire woe!

As I said, the author reverses the order in the case of her hero and heroine. It is Fedalma, the future Gypsy queen, who, as soon as she learns the mission that is to be her heritage, yields to the cry of her father's prayer, and throttles the love which heretofore had been her joy, her life, and turns away with Spartan heroism from the refining luxury of a Spanish *hidalgo's* home, to accept her inheritance of cementing and holding together the broken ranks of a wandering, homeless, persecuted race:

"Great Fate has made me heiress of this woe."

Should she obey the call of love, and espouse Don Silva, she tells him,

"'Twould be a self, corrupt with stifled thoughts of a forsaken better."

Upon the Plaza Santiago first beams upon us the fairy vision of Fedalma, the foundling, no one knows from whence, nurtured by the proud duchess, and chosen by her son and heir as his future bride.

Her radiant beauty, her spotless purity, her childish *abandon*, yet deep and emotional nature, make her the equal of the bluest blood and richest heiress of the land.

Yielding to one of her childish, native impulses,

VOL. IX.—22

she joins the *canaille* in a dance upon the Plaza. In a delirium of joy at this momentary freedom from the thralldom of court etiquette, she is utterly regardless of consequences. While her excitement is at its height, the throng of people is suddenly diverted by a band of Gypsy prisoners, heavily ironed, who,

"All, save one, walk in dark file, with grand bare legs and arms,  
And savage melancholy in their eyes."

As she stands holding her tamborine poised in air, the leading Gypsy's eyes,

"That seem to be the saddest in the world,"  
are fixed upon her, and hold her own,

"And the meeting light between their eyes  
Made permanent union.

She stood all quelled,  
The impetuous joy that hurried in her veins  
Seemed backward rushing—turned to chilliest awe,  
Uneasy wonder, and a vague self-doubt."

The light, joyous spirit is suddenly quenched, like a star under a stormy cloud. She returns home thoughtful and sad; meets her guardian and lover, Don Silva, and frankly confesses her breach of *les convenances*. He is horrified at this candid confirmation of a rumor that had reached him. But she calms his anger, and wins forgiveness, through the mere might of her transparent innocence. Then again she speaks:

"I meant to tell you how my dancing ended with a pang.  
There came a man, one among many more,  
But he came first, with iron on his limbs,  
And when the bell tolled, and the people prayed,  
And I stood pausing, then he looked at me.  
O Silva, such a man! I thought he rose  
From the dark place of long-imprisoned souls,  
To say that Christ had never come to them."

The italics are our own, and the lines justify their perpetuity.

The whole of this interview, in which each heart is bared to the other's gaze, compasses the fullest, purest power which love embraces. It is not two, but one soul welded by links of trust, of fervor, that no power save death can sever. Even now it stands on the verge of fullest fruition. They feel not the dark portent of the Gypsy's eyes,

"That star-like gleam from out black clouds of hair."

But to-morrow they will be united by sacramental bonds, and,

"What went before  
Will be the time of promise, shadows, dreams;  
But this, full revelation of great love."

But throughout all her present and anticipated joy, the form, the fathomless eyes of the Gypsy chief, like a phantom follow her. "This man's fate," she says, "has laid his grasp on mine appealingly."

In this Gypsy chieftain, now a prisoner of Spain, where, in the age of Ferdinand and Isabella, the war waged fiercest between the Christian hosts, against Moorish Infidel and Jew, we see limned in form and character the same dark athlete that has come down to us from out the black morasses and wild mountain passes of Bohemia; the man against whom every Christian hand was turned, every door shut; without a God, without a home, a wanderer by choice, loving his own people, seeking gain only for mutual aid, and steadfastly resisting any encroachment of those civilizing influences which could withdraw him from his own wilderness, and set his feet in the white man's sanctuary. Thieving, thriftless vagabonds as compose the tribe, this one type keeps his place in the foreground, as the sun around which all revolve, from which the whole band, far and near, draw good or ill. A sole power; an indefinable force to sway a multitude; a god among demons; a gentleman among vagabonds; an oracle among the ignorant; a man of unswerving honor and probity among a band of thieving, unprincipled outlaws. So continuously has this traditional figure appeared at different epochs, that we ask, Can he be a myth? a fancy sketch? or may not this marvel have been repeated again and again? This prophet, this restraining power, may it not indeed be a verity, and prove one of those marvelous providences amid a people through which God protects and holds in check an evil force, which if left to itself might convulse a world.

In the Zarca of George Eliot we have the grandest modern type of this Titan. He is a magnetic element, as impossible for the reader to resist as for those who come directly under the sway of his eagle eye. This is Fedalma's fate, for she proves to be his long-lost child; his heart throbbed this truth, as he saw her dancing on the Plaza Santiago. As she stands amid a blaze of jewels, after her last interview with Silva, she has taken up a mystic necklace of gold, every pendant of which is fraught with some remembrance that forms a link between her memory and some dim,

shadowy past. Suddenly the Zincali chief stands before her, and she feels that the hour of doom has struck. The scene between father and child is too thrillingly grand to be spoiled by mutilation. Enough, that the father finds his own spirit only smouldering in his daughter's weaker frame, and waits but a spark from his torch to burst into flame. There follows a paroxysmal struggle between the heart's behests and her lost heritage. But the magnetism of her father's eyes, the enthusiasm of his words, enthrall her, while the woes of her banned race, her duty to them as their future queen and redeemer, lure her on to her doom. Piteously she accepts it:

"Father, I choose! I will not take a heaven  
Haunted by shrieks of far-off misery.  
. . . I can never shrink  
Back into bliss—my heart has grown too big  
With things that might be."

Again: "I will take this yearning self of mine and strangle it. I will wed the curse of the Zincali."

When Don Silva found Fedalma gone, all the purposes of his life seemed quenched, like lights in burial vaults, upon which the outer air suddenly rushes. He knew that she had placed herself upon the rack, and walked over red-hot coals, to fulfill her heritage of woe. Love's cerulean robes she had doffed, and clothed her future in the dark serge of the outcast, lonely wanderer. But Silva's "soul sank with hunger pangs." True it was but "A little loss! only a dark-tressed maid  
Who had no heritage save her beauteous being!  
. . . But in the mystic charm  
Of her dear presence, Silva found a heaven  
Where faith and hope were drowned as stars in day."

When Silva comes, she turns her eyes away from the open gates of Eden, and

"Slowly she moved  
To choose sublimer pain,  
Yearning, yet shrinking, wrought upon by awe,  
Her own brief life seeming a little isle  
Remote, though visions of a wider world  
With fates close-crowded."

And now the Eumenides hem them in and solve the problem of these three lives, through the passionate utterance of the chosen victim. Finding that neither father or child can be won by reason or self-interest, then fall in desperate resolve from the lips of the "man born in purple," words that make him henceforth the vassal of the Nomad king. Turning to Fedalma, he says:

... "I can never turn  
And leave you to your difficult wandering;  
Know that you tread the desert, bear the storm,  
Shed tears, see terrors, faint with weariness,  
Yet live away from you; I should feel naught  
But your imagined pains; in my own steps  
See your feet bleeding, taste your silent tears,  
And feel no presence but your loneliness.  
No, I will never leave you."

To Zarca, who deems these words but idle  
compliment, he thus gives them emphasis:

... "I, a Spanish noble, here declare  
That I abide with her, adopt her lot,  
Claiming alone fulfilment of her vows  
As my betrothed wife."

In vain Fedalma expostulates, entreats:

"She shall be my people,  
And when she gives her life, I will give mine."

The sacrifice is accepted; "the outer air  
vibrates to the fatal words," and the angels hide  
their faces with their wings, as he forswears God  
and country, to live and die for a woman's smile.

The radiant beauty of the Trojan wife, and the  
dark eyes of Egypt's queen may flash, as the echo  
of this oath floats down amid the deepened shadows  
of Hades. But the wily chief is too wise a diplo-  
matist to trust to a rash resolve that is born of  
resistless passion. So probation stands between  
fruition; and the silent, solitary post of sentinel  
marks his weary hours, giving time for conscience  
to strip his fatal act of all its sophistry. And  
there comes thronging around him old images,  
streets, altars, ancestral home, banners and trophies,  
mingled with the approval or scorn of men, all  
making "loud insurgence." This phantom pres-  
ence he finally grapples, and strives to strangle,  
in a soliloquy whose grandeur might stand without  
shame beside that of Hamlet or Richard.

The thrilling "hellish rhythm" of the Gypsy's  
curse upon the forsworn Spaniard, which the  
band chant in chorus as he keeps his lone watch,  
is a fitting climacteric to the scorpion's sting of  
conscience. Another striking character—one too  
in unison with the age—is Father Isidor, a Do-  
minican monk, who holds the office of grand in-  
quisitor. He is a type of those men who in that  
tempestuous period held God and his Church as  
the watchword that moved every heart and every  
arm to instant action. Mistaken, like Torquemado,  
yet earnest in the belief that justice was more  
acceptable and potent than mercy:

"He who loves God and his law, must hate the foes of God.  
And I have sinned in being merciful."

This Father Isidor is among the prisoners who are  
taken at the siege of Bedmar, and is consigned for  
judgment to Zarca, who is allied with the Moors.  
He is condemned to death, and Silva sees him  
with the rope of the hangman about his neck, his  
countenance white and grand with the radiance  
of the martyr's recompense. He hurls an anathema  
upon the soul of Silva, his recreant nephew: "A  
traitorous leader, false to God and man." "A  
knight apostate," and the murderer of the "*twin  
brother of your father*." His words fall like a  
rain of fire, and teem with the majestic utterance  
of an outraged prophet, searing the conscience of  
Silva, and driving him to remorse and despair.  
Finding his wild entreaties for the life of his uncle  
unheeded by Zarca, the wild shouts of triumph, as  
he is swung in air, drive him to phrenzy, and with  
a bound he plunges his dagger in the heart of the  
chief. "And all the while the silent beat of time  
in each man's soul, made aching pulses." Don  
Silva is released by the order of the dying chief.  
One instant he pauses to look at Fedalma:

"Carrying forever with him, what he fled—  
Her murdered love."

Yet once more they meet again, for an eternal  
separation. The Zincali are about to bear the  
body of Zarca to a distant land for sepulture.  
Fedalma grieves for the dead, yet her heart  
hungers for the lost, living love. Presently a  
tall and gray-clad pilgrim arrests her attention  
on the verge of the crowd. After a long contest  
she says: "Yes, I will go, for loving me made all  
his misery." Silva tells her, as they stand apart  
that he is going to Rome, "to be absolved, and  
to seek the right to use his knightly sword again,"  
but he adds:

"I shall drink  
No cup of purest water, but will taste  
Bitter with thy lone hopelessness."

But Fedalma strives to console him by the assur-  
ance that she will find her happiness in keeping  
her father's trust,

"Though I die alone,  
A hoary woman on the altar step,  
Cold 'mid ashes."

To his self-reproach for her father's loss, she  
nobly replies, "in tones, as with slow agony:"

"Calamity comes like a deluge and o'erfloods our crimes,  
Till sin is hidden in woe. You—I—we two  
Grasping we knew not what; that seemed delight  
Opened the sluices of that deep."

The dignity, the pathos of the parting scene,

swells the heart with sympathetic emotion, and the eyes with tears:

"They knew naught, save that they parted; for their mutual gaze

As with their soul's full speech, forbade their hands  
To seek each other; those oft clasping hands  
Which had a memory of their own, and went  
*Widowed of one dear touch forevermore."*

And thus we leave each to work out an expiation, whose high allegiance, unmitigated woe and deep self-immolation to God and duty, fall like a strong tidal wave over a plain of dead carrion, washing away in the ebb all foul substances and enticing once more to these old homes the flowers whose beauty had once brightened its bosom of verdure. Sad, inexpressibly sad, is the poem in effects; but as the most salutary lessons are hid in the garb of affliction, and often prove our best friends, so we may learn herein how repentance and atonement for the weightiest sin may condone a wild despair when driven by that revenge which

"Is wrought by the long travail of mankind  
On him who scorns it, and would shape his life  
Without obedience."

And so we leave Don Silva, but think tenderly of him, with Fedalma,

"As one who will regain the only life  
Where he is other than apostate—one  
Who seeks but to renew and keep the vows  
Of Spanish knight and noble."

There are other incidental characters and striking scenes throughout the poem; but our limit will not admit them now. Dramatic poems as a rule, judged from the standpoint of living action, with the accessories of scenic effects, have rarely been successful. Yet in every literary era, the most gifted poets have essayed this difficult flight, and in soaring to this "dome of many-colored glass" for a perpetuity of fame, have rarely attained fruition. We need only refer now to two of the most recent examples among the most famous. Swinburne's "Bothwell," and Tennyson's "Mary," both lamentable failures; a just verdict, earned by the bitter *animus* and perversion of historical truths that characterize each. Even Byron with his supreme genius has met with but limited success; "Werner," we believe, being the only one of his dramatic poems that has ever

been put upon the stage, and that owed its chief success to the great tragic genius of Macready, the sole artist we think who ever assumed the *rôle*. We cannot judge the "Spanish Gypsy" from this standpoint, although under skillful management it might be susceptible of striking dramatic effects.

When George Eliot's labor of life has ended and her works are weighed in the balance, this poem will attain higher appreciation, and in conjunction with "Romola," and through the might of that exalted and reverential spirit which pervades their general tone, these works will be the chosen tablets upon which will be graven her most enduring fame.

Within a few months, two of the most intellectually gifted and distinguished women of any era have closed their earthly career. Unfortunately, neither the interior life, nor the productions, of either George Sand or Harriet Martineau were illumined by those imperishable truths which can alone adorn with perennial lustre everything upon which their rays fall. Brilliant as were the talents of the former, yet for us, the glory of her genius lies forever tarnished under the mould of Alfred de Muset's early grave; and the halo that encircles all that is virtuously gifted in woman is herein clouded by the atheistical principles and ethical radicalism of her greatest mental productions. Gifted in intellect, gentle and benevolent of heart as was Harriet Martineau, yet no ray more effulgent than the cold abstractions of Positivism, influenced her life or gilded her last hours; no fruit productive of everlasting blessings for herself or those who cherish her memory, can be garnered from the patriarchial years that crowned her days.

It is sad then to think that the last one of this eminent trio, Mrs. Lewes, is walking in the same sandy footprints—sad to know that the light she follows is delusive—that the hundred talents entrusted to her keeping, although not altogether uselessly invested, yet they have been perverted from the lustrous setting, the jeweled clasp, which alone might link her name in ages yet to come with those who, while enriching their own life-work, have not proffered stones in lieu of bread, or given vessels void of refreshments—but in extending aid to the weary and waiting have also glorified their own souls.

## DOMESTIC LIFE IN RUSSIA.

By S. T. EVENS.

At this particular period of the world's history the attention of the American people in no very limited sense is turned toward Russia, and a general desire is being manifested to know more about her government, laws, people, and their manners and customs. This interest is awakened chiefly through the agitations and influences growing out of her war with Turkey; for at this writing it is difficult to tell how the great struggle will termi-

Russia is, however, a difficult country to become acquainted with, for the traveller finds himself in an unfamiliar land, peopled by a race of whose thoughts and feelings he knows as little as he does of their language; and the information he receives from the persons he questions is either meagre or untrustworthy.

Her police regulations are vexatious; and on entering a hotel the traveller is

A RUSSIAN PATRIARCHAL CHURCH.

nate, or exactly what part Russia is to play, or what position she will occupy among the nations of the Old World in the near future. The friendly relations existing between the United States and Russia, and the commercial intercourse developed make us even more than idle spectators of her movements, successes and defeats. While we as a power stand neutral, as a Christian people we can scarcely say that we occupy independent ground. The triumph of the Cross is more in consonance with the Christian heart than that of the Crescent. And apart from and independent of the Christian and commercial sides of the questions at issue, the American people have many other reasons for feelings of friendship for Russia, and a desire to learn more concerning her people.

bound, under awkward penalties, to give an exhaustive account of himself in a book kept for the purpose, and not only to enter into intimate relations with the authorities, but to have his mind made up as to his plans, and to purchase a *permis de séjour* or *de voyage* for a certain number of days; and this leave must not be exceeded without an authoritative extension of it.

The travelling arrangements for those who choose to use rail or steamer are pleasant, if one does not object to a rather oppressive atmosphere in the carriages, for during the greater part of the year the Russian's chief idea is to protect himself against the inclement climate; and as he keeps the windows and doors of the public conveyances heremetically closed, involuntary contact with him

becomes anything but agreeable. But if the traveller wishes to gain an intimate acquaintance with Russia, and to see what is the real life of the people apart from towns and highways, he must be prepared to take many a long and tedious journey in a kind of lumbering cradle on wheels, or peasant's springless cart; for in some vehicle of this kind he will have to be bumped and jolted the livelong day, plagued with dust and heat in the summer, and in winter liable to frost-bite and snow-blindness; while he will probably be unable to get any food beyond what he carries with him, except black bread, pickled cucumbers, and sometimes eggs.

The northern portion of Russia consists chiefly of forest-land and morass, plentifully supplied with water, and broken up by numerous patches of cultivation; and the villages are generally composed of gray huts built on each side of a straight road which at times becomes a river of mud.

The big white church with its fine pear-shaped cupolas rising out of a bright green roof; the meadow in the foreground, through which meanders a sluggish stream; the whitewashed manor-house, with a veranda in front, standing on a bit of rising ground, and half concealed by a cluster of old rich-colored pines; none of these details are beautiful in themselves, but all combine to form a very pleasant picture when seen from a distance, especially in the soft evening twilight.

The style of architecture exhibited in some of the buildings, however, is very elaborate, and occasionally we come across edifices quite imposing. The Russian Patriarchal Church, shown in connection with this article, while it presents the pear-shaped cupolas, gives us evidence of artistic and mechanical taste and skill.

Every little household in these villages is a kind of primitive labor association, the members of which have all things in common, and submit to the arbitrary will of the *Khosain* or head of the family; while the wife of the Russian peasant is a very unromantic style of female, with very little sentiment in her otherwise kindly nature; but she manages to bring up her children on what is the veriest pittance of a wage, in a manner that would do credit to many better situated English peasant-women. In the northeastern provinces of Russia the peasant has an extremely hard fight to maintain against the hostile forces of Nature, his field-labor sometimes resulting in no gain at all. He

makes a living in various ways; and for whole days he wanders through the trackless forests in search of game; or he spends a month away from his home, fishing in some distant lake; or else devotes the summer to deep-sea fishing, bringing home, if he is lucky and frugal, enough money to tide him and his family over the winter.

From an excellent work on Russia, by D. M. Wallace, to which we are indebted for many facts, we glean this "family budget," which will give a good idea of the expenditure of a peasant household in the northern part of Russia: £7 spent on rye meal (2240 pounds), to supply the deficit of the harvest; £3 on clothes, tackle and ammunition; and £2 5s. paid in taxes. The income, during a tolerably prosperous year, was £12 5s., chiefly obtained from the sale of game and fish.

As the peasant family of the old type is a kind of primitive association in which the members have their goods in common, so the village may be described as a primitive association on a larger scale. This association embodies, in a degree, the idea that is now being agitated and discussed in our own country. The coöperative associations and labor-trades unions are but developments of the same idea in other forms. In Russia, this association has an administrator at its head, whose power is limited by the will of the Heads of Households themselves, forming a kind of village parliament, which is directly responsible to the State for the due and timely payment of all tithes and taxes. Various are the matters with which the village parliament has to deal, from the election of office-holders and the periodical collection of the taxes up to the redistribution of communal lands—a subject which is often the occasion of lively scenes. But when once a decision is given, it is respected as scrupulously as any of the "Acts" of the House of Commons in England. In order to enable the reader to better understand the peasant character, we have prepared several sketches, and they illustrate several phases of peasant life. One of these shows us "A Russian Peasant, or Serf," with his rustic staff and sack. This subject is beyond the middle-life period, and with his heavy, gray beard and fur cap, presents a robustness of physique and an intelligence of expression that speak well for the race.

Younger life is seen in the picture of "Russian Peasant Girls." These two figures give a better idea of the style of dress, features and expressions,

than a mere pen-picture possibly could. The old log cabin home is also better when seen than described. Our engraving of "A Peasant Mother and Child" will also help us to better understand the domestic life of this people.

Thus we see in Russia the "Commune," or "mir" as it is called there, in full working order; and in a country ruled over by a despotic monarch it is perhaps the nearest approach to municipal or constitutional institutions that can with safety be attempted. The mir was instituted by the present Emperor or Czar, when he carried out that wise and humane act which will forever be associated with his name—namely, the emancipation of the serfs; and it has scarcely been long enough in existence yet to predict what form it may ultimately assume.

This liberation from one form of bondage of so many human beings will ever make sacred the memory of this monarch.

The Russian peasantry are, for the most part, grossly superstitious, and this may be owing in no small degree to the very inferior religious teaching to which they are accustomed; for we are told that they have not the faintest conception of anything like an inner religious life, but are the slaves of mere rites and ceremonies. For example, though a robber will kill a peasant on the highway, such are his religious scruples, that he will not eat a piece of cooked meat which he may find in his victim's cart, because perhaps it is a fast-day; and an artisan when about to break into the house of an Austrian attaché in St. Petersburg, first

entered a church and commended his undertaking to the protection of the saints, then killed the attaché in question. It is a species of grim fanaticism which binds the masses in Russia. The shrines in the public places are crowded with worshippers, who cover with their kisses the gilded pictures, while showers of small coins or copper money rattle into the boxes which the priests hold in their hands. From these and

A RUSSIAN PEASANT, OR SERF.

other circumstances, we are warranted in saying that the Russo-Greek Church is about the most debased form of Christianity.

great changes which are taking place, and by which the old spirit of caste is dying out; while a number of nobles are infusing new ideas into

mercantile circles. Far above the trading classes stand the members of the official circles, who spend their days at their desks, and while away their evenings at card-playing, which is carried on to an extent unsurpassed in any country in Europe. This is doubtless owing to the eternal dullness which pervades Russian towns, but which one of their poets has declared to be the essential characteristic of Russian provincial life.

We come now to the nobles of Russia, of whom there is a very considerable number; but very small value is attached to a mere title, and there are hundreds of Princes and Princesses who have not the right to appear at court, and who would not be admitted into what is called in St. Petersburg *La Société*, or for matter of that, into refined society in any country. For instance, not long ago a certain Prince Krupotkin gained his living as a cabman in the Russian capital. The only genuine Russian title is Knyaz, which is commonly translated "Prince." The bearers of this title are the descendants of Rurik, of the Lithuanian Ghedimin, of the Tartar chiefs

RUSSIAN PEASANT GIRLS.

Not very high above the working classes of the towns in the matter of intellectual culture, come the traders. Many of them are very rich, but exceedingly ignorant, and do not bear a high character for honesty; but like every other class in Russia, this one is also being affected by the

who were officially recognized by the Czaars, and of fourteen families who adopted it by imperial command during the last two centuries. Peter the Great introduced the foreign titles of Count and Baron, he and his successors conferring the title of Count on sixty-seven families, and of

Baron on ten. Of the noble families, very few are rich, and none of them possess a shadow of political influence.

In Russia there are more than a hundred thousand landed proprietors, but it must not be inferred from this that they are equal in point of wealth to our millionaires in the United States, or the landed gentry in England. Such is very far from being the case, for many of them are in a state of poverty, the wealthy ones not exceeding four thousand in number. This latter class includes two distinct schools of land-owners, so to speak; those of the old school being described "as contented, good-natured, hospitable, but indolent, apathetic, and dull;" while those of the latter are a roystering, boisterous set, fond of drinking and dissipation, and possessing a morbid passion for sport of all kinds, however demoralizing or degrading it may be.

Many travellers in Russia have been astonished and not a little disgusted with the depravity of official life. The taking of bribes by persons in authority seems to be general, and has been represented as arising in some measure from the inadequacy of salaries. From whatever cause, this forms a blot on Russian society, which we hope may disappear with the progress of education and intelligence.

In Russia, it is somewhat satisfactory to learn, Mohammedans and Christians get on very well together, and not only help each other, but take it in turns to be at the head of their several Communes. This shows that under a tolerably good

government the two races may enjoy a great amount of good fellowship and freedom, without any reference whatever to religious differences.

A PEASANT MOTHER AND CHILD.

All are loyal subjects of the Czar, to whom all Russians, of whatever rank or religion, yield an unhesitating and child like obedience. But even this great measure of loyalty does not prevent them from occasionally resisting his authority when great interests are at stake, as is proved by the

existence through many centuries of a secret society called the "Raskol," which all the known power of Russian Emperors has failed to dissolve. So long as the Czar, however, identifies himself with the enthusiasm of his subjects, and especially with the religious portion of them, his authority within his dominions is irresistible; but should his policy ever come into collision with the teachings of the clergy and the feelings of their flock, the reverence paid to his sovereignty might be rudely shaken.

The saddest sight in Russia to a traveller is the manner in which civil-prisoners are treated. It is a common spectacle to see three or four hundred poor wretches on their way to Siberia under a military escort; for most of them are chained together in couples, while the women and children who have elected to share their bread-winners' lot have also to submit to be treated as criminals. Poorly clad, and apparently half starved, the wonder is that any of the party should ever survive the dreadful journey. A Russian criminal condemned to exile is sent away with very little ceremony; but when an officer of the army or other person of note has been sentenced to banishment for life, he is dressed in full uniform, and led to a scaffold in some public place. In the presence of the crowd he is made to kneel while his epaulets and decorations are torn from his coat and his sword broken over his head. He is declared legally dead; his estates are confiscated, and his wife can consider herself a widow if she so chooses. From the scaffold he starts on his journey for Siberia. His wife and children, sisters or mother, can follow or accompany him if they choose, but only on condition that they share his exile.

Mr. Arnold, in his book entitled "Through Persia by Caravan," relates how, when passing through Russia, he saw a party of prisoners embarked on board a steamer on the river Volga. They were positively caged amid-ship, so that every part of the interior could be seen, just as in the lion-houses of the Zoological Gardens, with this difference—that in the case of the prisoners there was no overhanging roof to prevent rain or sunshine from pouring in upon their wretchedness. At the back of the cage there was a *lair* common to all, without distinction of sex or age. And when all were secured, including the guiltless women and children, fights occurred for the places least exposed to the east wind. This is a system

which must surely fade away beneath that public opinion which is fast becoming too strong for even autocratic monarchs to despise; for we are told that the emancipation of the Russian serfs has made a vast legal, social, and material improvement in the lower orders of the people; and it is to the people that the world will look for that much-needed reform which will enable Russia, perhaps at no distant day, to take an honorable place amongst civilized nations.

We know that in England a *village* has a church, but no market; that a *hamlet* signifies a collection of houses too small to have a parish church; that a *town* contains both a market and a church, and that a *city*, in a legal sense, is an incorporated borough, which is, or has been, the location of a bishop's see; but exactly *why* a *village* was so called was the important query. Here, in the United States, the names of such places are never used in such a restricted sense. No requirements so explicit hem in and cramp the use of the words. But if we go back to the time when the Gauls and Lombards invaded Rome, we learn that *village* was used in an entirely different and still more contracted sense than the word as now used in England. In this connection an anecdote is related by Mr. Wallace, who, upon one occasion when travelling on the great plain which stretches from the Sea of Azov to the Caspian, observed on the map the name "*Shotlandskaya Kolonyia*" (Scotch colony). Being curious to ascertain why a village was so called, he made a pilgrimage thither and made inquiry. No one could tell him; but at last he was advised to ask an old Circassian, who was supposed to be learned in local antiquities. To this man he put a question in the Russian tongue, explaining that he was a Scotchman, and hoped to be able to find a fellow-countryman in the village; whereupon the old Circassian replied in broad Scotch: "Why, man, I am a Scotchman too!" He explained, however, that he was only a "Circassian Scotchman," being a native of the Caucasus; and as a child, had been purchased and brought up by the Scotch missionaries, who were then patronized by Alexander I., but were suppressed in the year 1835 by Nicholas.

The history of Russia is one of thrilling interest, and while we have merely given a sketch of her civil life, her military record abounds with the daring and heroic, and to it we may some other time invite the attention of our readers.

## BEGUILED—A STRANGE HISTORY.

BY WARNER WALTERS.

## IN TWO PARTS.—PART I.

It is not ours to separate  
The tangled skein of will or fate,  
To show what metes or bounds should stand  
Upon the soul's debatable land.

"Mine has been a strange life. As far back as I can remember I have felt that I was not like other men," musingly muttered Francois Faber; and seeing Leila Brosius about to utter something deprecatory of his statement, he lifted his black eyes filled with weird power to hers, whose fullness suggested the richest purple of the pansy, and continued, more distinctly: "Do not obstruct my speech, Miss Brosius; like the brook in yonder meadow, I am not often impelled to rise above my bounds, and this June night, with its sullen moon-glare and oppressive air, invites my confidence. See you, I will not so much as flatter you by suggesting the presence of an appreciative listener. As I said, I cannot recall the time when I did not feel isolated, and as if I were of another race of beings; and often have I imagined that in place of the senses and motives of ordinary mortals, this frame encased the nervous tissue and brain cords of an inhabitant of Saturn or Mars. I do not come under ordinary laws; indeed, I suspect myself at times of being an Antarchistic. There are few things which seem to please earth's residents that possess a charm for me. Some of the mystic poets, Browning, Poe and Walt Whitman; some of the weird creations of the painters as well as the more sombre moods of Beethoven, Weber, Wagner, or St. Saens, find for me, in that mystery we call the emotions, an answering chord. Here I am, at twenty-six, nothing but a dreamer. My father was wrapt in the study of old books, and my mother, whose face, other than a painted semblance, I never saw, was, I feel, like me, a visionary. Both have gone hence, and I and an older brother remain. You, of course, have never seen Bertram! What a glorious fellow he is! so charged with vigor and electricity—a Bayard and a Crichton. There are no megrims or *malaise* spots in his composition. He attracts, I repel; he the positive, I the negative pole of the Fabers. Wheresoever he goes, he draws all men after him,

while I shun society, for I carry with me the vapors of a mental charnel house. Joined to a handsome person and the face of an Apollo, he possesses those subtleties of speech and personal refinement that craze women, and make him a demi-god among men.

"I have lived here but a year. No one hereabouts knows of me or mine. This house, with its spectre-ridden air attracted me, and I purchased it, and brought into it my only friends, an organ, an easel, and the few books I read. Some day you will honor me by looking at the rare old furniture, the collection of arms, my toxicological curiosities, and other matters which I have gathered about me. My brother is in Europe, and I wist not when he will return, for he finds in me anything but a companion. Do you wonder at it; having met me, the Frankensine of this village? When I saw you some weeks ago from my window, there came the thought that you were not as these plodding, idealess villagers; I wanted to come out and bid you welcome to tread the many rambling paths that run madly 'through the land. You see I allow no one to disturb the rioting of the vines and shrubbery. I am my own gardener, and only when humanity is asleep I venture from my room, and follow, with a sense of freedom, their windings. Here a vine has encroached on the pathway—I turn it from its course; now a tree has fallen over the spot my feet would take—I tear it from its bed and triumph over 'natural selection' by casting it back. No eye watches me, and I know that I rule with despotic will, in the silent watches of the night, let those who will rule by day. *Then* they are many; but in the night season, none dispute my law."

"Save one," reverently said the half-dazed maiden.

"Who else can wander through these paths when darkness calls upon the sons of men to seek their pillow?"

"An eye that never slumbers nor sleeps," responded the half-startled girl, as she rose to go.

"Do you then think that He concerns himself about Francois Faber, into whose body the spirit

of another planet is infused? What has He to do with me?"

"God ruleth over all," she decisively returned, moving toward the stone-arched gate.

Francois Faber followed, and as he walked quietly by her side, his slight, graceful figure was more distinctly seen. His was a singularly pallid face, doubtless from much in-door life, else the sun's light would have bronzed or tinted with color his regular features. His intensely black eyes and scarlet lips spoke also of the hermit. The expression of his face was that of questioning wonder, but about his lips there seemed to play glimpses both of a fine humor and firmness, the latter predominating. On his head was a broad sombrero, from beneath which stray curling locks escaped.

"Miss Brosius, I beg of you not to think of me as a monomaniac. I often allow my thoughts to entertain strange vagaries, and I have amused myself with such success in this direction that often for the time they seem real; but I am not so wild a creature as to hold them in sober earnest. You know the imagination is a source of wonderful amusement, and I, with a life much contained within its own orbit, have cultivated the faculty as I would a fine art. Were it necessary to be less exclusive, and associate more with my fellow-men, I would be found practical enough," said the youth.

"I am glad to hear thee say that, Mr. Faber," heartily responded the maiden. "I was almost ready to declare thee a misanthrope, or one with perverted mental sight. Thee will not take offence at my plain speech, I trust?"

"Far from it. It is in happy contrast to the ordinary hollow speech of the present day," he answered, and extending his hand to the beautiful girl as she passed out of the gate, cordially concluded, "I hope you will honor this forlorn, old place, by using it whenever you feel so disposed. I am convinced we are yet to be great friends."

Leila Brosius, whose graceful form receded in the shadows beyond the gate, had come into this irregular little village of Granville, with her aunt as a chaperone, to escape the noisy bustle of the city, where her father was engrossed in business. Not long before, her mother, a *Friend*, but not after the strictest sect, had closed her eyes upon things earthly; ever since, Leila had been longing to leave the city, and get among the hills and verdant

fields that had been so dear to her mother. The mother's beautiful complexion and gentle manners were bequeathed to the daughter. Her beauty was not suggestive of the city, with its wonderfully clear, white and vivid color, which often dyed the dimples on the rounded cheek with the color of the bright blood which coursed beneath. She was "in the world, but not of the world." Possessed of the present susceptibilities, and ignorance of the world and its wickedness, her thoughts were as pure and undefiled as the waxen bloom of the camellia. Under the training and guardianship of a sensitive mother, her intercourse had been with the grave and unexcitable "Friends;" beyond their walk and conversation she knew but little, since her mother had watched over her speech and conduct with jealous care. She was an only child, and on her education the mother with patient hand and watchful eye had bent her energies. Wholly unused to the great world outside the mother's kingdom, as innocent as a little child, there yet burned beneath a calm exterior, fervid emotions inherited from her father. She little knew the dangerous paths she now must tread, since the gentle yet firm hand of the mother would no more guide her footsteps. Mr. Kingslake Brosius had made a love-match with her mother, and under her mild sway had found but little exercise for the glowing temper of his character, with its violent likes and dislikes; his warm affections and impetuous speech had lain *perdu*. Naturally, now that tempering element in the household was eliminated, the genuine quality of the man would come to the surface, and put in play new springs of action and emotion for Leila. The father, having resigned the care of the child to the mother, did not grasp the subtleties and modes of the mother's training. It was therefore a dangerous era in the life of the maiden's history, and at sixteen, when the heart and the sensibilities are so acute, the change of the guiding and moulding power was not likely to be for Leila's good. Neither father nor daughter knew of the whirlpool into which their lives were turning. Dorcas Brosius, the aunt, seemed the most convenient person at hand to attend Leila on her summer vacation, but she was far from the best chaperone; the scope of her life was by far too limited, and without being positively a fool, she gave many of the indications of one. Her life was retrospective; the present had no pleasure for her, and so she lived in the rush-

light of by-gone days. Leila had now been in Granville several weeks, and for her shorter rambles had, by some kind of "natural selection," made the Faber grounds a daily visit, just as many people are nowhere else contented than in a certain chair, and a certain spot in the universe is to some a matter of more importance than aught beside. From a hurried glance to a bow; from that to an exchange of salutations; from that to meteorological comparisons; from that to a combination of all, and interchange of half-dozen of sentences, the acquaintance had progressed which at last resulted in the interview above given.

Of Francois Faber, the villagers knew positively nothing; and in lieu of fact, surmises and fiction were invented. No man can live to himself, in a country town, save at the expense of his reputation, which would be a horrible reflection, did one not also remember, it is barely possible should he be gregarious, even then to preserve immaculate his character. He was a revelation to the fresh, pure-hearted girl, and his assertion that his spirit was that of another sphere was hardly too violent an expression to indicate the light in which she viewed his wild theories. Everything belonging to him excited her curiosity, and she burned to see the inside of his house and to know more of his history. He repelled and attracted, both; the sweet, half-mirthful smile of his face, was, to her as a rift in the clouds, through which came glimpses of the sun and the spirit-land; her weird ideas and the often grotesque language in which he clothed them, were as dense, sullen clouds, which could only be parted by his radiantly engaging smile.

Dorcas and Leila Brosius were seated in the little parlor of their boarding house several evenings later; a lamp, giving out but a ghost of a light, quivered on the centre-table, by which one could barely distinguish the peacock's feathers, a pair of highly colored vases, and some daguerreotypes folded in exact triangles on the mantel; the table upon which the lamp stood was rather more plainly discernable, with its half-dozen books piled in grim regularity about the edge; the volumes with the brightest binding carefully placed on top, each pile elevated to the exact height of its neighbors by the insertion of worn school-books, and here and there a Patent Office or United States Coast Survey Report about the wall; also, at uncompromising distances were planted the

chairs; and each of the four sides supported a print, with staring red water, or blue moons, and other lithographic wonders. But why prolong the description when the world knows by heart the "best room" of the extreme rural population. The elderly woman set apart, with book in hand; but to look at her eyes, one felt it a violent presumption to say she was reading. Leila sat in the daintiest of white wrappers (for the mother had not insisted that her daughter should don Quaker habits, unless she herself should so elect, when grown to womanhood), her dainty feet playing hide-and-seek with the ruffling, and a bunch of bright color at her throat. The twilight was not so gloomy as to hide the figure of the graceful girl, nor to darken the fair arms thrown over her head. Half-startled, she rose to answer the tap on the door-frame; the door itself being thrown back to admit all the air.

"Were you eating the Lotus leaf?" inquired Francois Faber, extending his hand towards her.

"Thee speaketh in parables," quietly responded the maiden, astonished beyond measure at the call, which for Francois was an unheard-of act.

He quoted—

How sweet it were, hearing the downward stream,  
With half-shut eyes ever to seem  
Falling asleep in a half-dream;  
So dream and dream, like yonder amber light,  
Which will not leave the myrrh-bush on the height  
To hear such other's whispered speech,  
Eating the Lotus;"

and then went on to explain his meaning. After he had concluded, she apologized for her ignorance by telling him of her mother's faith, and even as she spoke the tears came into her eyes, and her voice quivered as she thought of the gentle hand that would no more caress her shining hair. With sympathetic voice he led the conversation to other matters; and there was no trace of misanthrope or visionary in the lively *persiflage* that issued from his lips. Leila listened in wrapt pleasure to the dainty fancies or merry "quips and quirks" of the speaker; it was all so new, and opened up the heretofore unknown possibilities of the English language. When, at length, he rose to go, he remarked: "It will give me great pleasure to have you call and examine my collection of *bric-a-brac*, if you care for such things. Those who have made these matters a study assure me that it contains some very rare articles. You will persuade Miss

Dorcas Brosius to come, will you not?" he said, turning to Leila.

"Oh! I should like it above all things, and aunt Dorcas, thee will desert thy book. Cannot thee go to-morrow morning?" she asked; and to the eager demand the aunt gave a dignified assent.

The morrow found them walking up the path that led to Faber's house, under the guidance of Francois, he having espied them from his window. If possible, he was more gracious than the evening before, and kept up a running talk which amused and sometimes startled the visitors. The collections of curious articles, which included arms, idols, carvings, coins, strange pictures, mosaics, and many other things new to the fair, were examined and wondered at; Francois entertaining them with their half jocular and half mystical histories. Leila began to almost reverence the owner of so many new things, and the nonchalant manner in which he alluded to them; as for herself, she hardly dared to touch them; she opened wide her eyes at the squat grotesqueries of some Chinese and Japanese idols, and turned pale as Francois explained the mummies, and was persuaded to feel of the wonderful gold and silver fabrics from Russia, and a roll or two of valuable lace; but her eyes sparkled when he placed before her a velvet mat, on which were arranged a number of precious stones. With a child's simplicity she exclaimed, as he unlocked a cabinet in which were a number of pearls, diamonds and other precious stones: "These are beautiful; I like these best," holding a beautiful pearl to the light.

"Will you not keep it as a souvenir of your visit?" quickly responded Francois, who acknowledged to himself that it was a fitting emblem of the fair maiden, and that in many, many years he had not experienced the pleasure he was now passing through.

"No, no, I cannot despoil thy collection."

"See," he eagerly exclaimed, selecting a number of others from the case, "there are plenty more, surely you will take a mere pebble, a pretty stone; you know the Eastern custom that to be friends one must break bread at a friend's table; we are to be great friends, are we not? and so you must accept this trifle from me."

She looked up into his face, and answered:

"Thee should not deceive me, for well I know that this is of much value; the Bible doth speak of the exceeding value of pearls."

"Well, if it is the value of the gift you object to, let me give you one whose beauty is even greater than the pearl, but by reason of its abundance, it is not greatly prized," taking from another drawer an opal of exceeding beauty and lustre, and putting it in her dimpled hand. "The pearl," he continued, "is not of such great value after all; this is the much more precious stone," pointing to a diamond which glittered among the other gems.

"Thee will not mock me," she asked, "if I accept this stone, whose tints are lovely as the rainbow; I cannot take it from thee if it is of great value."

"It has no value for me, unless you take it; if you do not, I will throw it in yonder stream," pointing to the river which could be seen through the curtained windows at no great distance. "I want you to see a picture that stands in my room," he hastily added; "Come with me," and he led her to a beautifully adorned room, in the middle of which stood an easel, on which a newly-painted picture was affixed. It was the portrait of a noble face, and evidently the loving work of one who had pursued his study with enthusiasm. It was of a face bronzed with exposure, but one in which the outlines or expression had never been marred with sin or evil passion; although the smile on the lips was gentle and full of sweetness, the eyes had a shade as if they had known some poignant sorrow; there was a world of power, will and endurance limned thereon. Perhaps the expression of intellectual power and strong mental faculties was the most pronounced stamp on the face, after the noble mould of the head and the indication of noble purpose. It was a handsome face, and the apparent seat of all virtues. Leila looked in silence for a time, and then turning to Francois, who regarded her with watchful eyes, half whispered:

"This is thy brother?"

Francois nodded assent.

A little longer she gazed, and then asked:

"Thy brother's face is full of all manner of good things; I would know him, his face is so noble and so strong. When will he come to thy home?"

"I hope Bertram will come to me before long; you should know him Miss Brosius, this picture but half tells the story; no nobler and more chivalric soul than Bertram's exists."

"Methinks that King David's face must have been like unto this," she mused, her eyes never

wandering from the portrait. For some minutes she stood looking as if she would read its every line and feature, then turning away, they left the room in silence. While the party were walking down the path, Francois asked :

"Miss Brosius, I have a great favor to ask of you ; you will grant it ?"

"If it be in reason, I could not deny thee, after this morning's pleasure."

"Will you give me a couple of sittings ? I would have your picture as a companion portrait to that of my brother's ; I would then have my Bayard and the 'Sinless Child.'"

For a moment she turned her pure eyes to his as if to read their meaning, and then spoke :

"Wouldst thee call my face that of a 'sinless child ?'"

"Yes ; for nowhere else have I ever seen so perfect an embodiment of the thought :

Gentle she was and full of love,  
With voice exceedingly sweet,  
And eyes of dove-like tenderness,  
Where joy and sadness meet."

"I cannot grant thy request ; with such a title the picture would savor too much of vanity. I am far from being sinless ; I know my heart is full of wickedness, and my steps of guile."

"You will accede to my request, will you not, if I forego the title ?"

"I fear the thought proceedeth from vanity, but I would see myself in a picture, and will do as thou dost desire," quietly answered Leila, and then bidding him adieu, they left the grounds.

It was not long before Leila received a note from Francois asking her to give the writer the first sitting. At the hour appointed both ladies were on hand, and the work of painting commenced at once.

To the right of the sitter, on another easel, the portrait of Francois's brother stood, and to it Leila often turned her liquid eyes. There was a strange fascination in that noble face. As her eyes rested upon it, she asked herself a thousand questions, and at last so intent were her thoughts that she passed from this present, living being, into that mysterious country we call dream or trance-land. Her eyes were wide open, and yet it was not the things of earth she saw, but the phantasies of Castilian castle-building. Who has measured the boundaries of that mental springtide, or described the wealth of its storehouses ! It is as if

one were suspended between earth and heaven in an exhilarating æther, in which the poet, the painter, and the musician were plying all their arts with superhuman skill to mould their work with the richest skill.

With the subject in suspension the artist worked rapidly, and caught with facile power the pose and contour of Leila's face. Dorcas, too, had taken wings and was pursuing some youthful labyrinth, from which she was not wrested by a question directed to the painter :

"Hast thou heard from thy brother lately ?"

"No, Miss Brosius, I have not ; but I am daily expecting a letter. I would like to read you some extracts when it does come. I am sure you would enjoy them, for Bertram is a rare writer, and the country through which he is travelling is one full of romance and adventure.

The next time Leila came, Francois announced the reception of a letter, and in a quiet corner he read the epistle. It was indeed as he had promised, well worth listening to ; the diction was at once so clear and polished, while both the descriptive and narrative portions were not devoid of excitement. Leila heard like one whose soul was actually parching for its contents. When he had finished she sighed, and shook off the intensity with which she had listened.

"Is that all thee thinkest will interest me ?" she inquired.

"About all. I had written him concerning you, and he devotes considerable space to questions and surmises. I shall have to entreat your forgiveness, Miss Brosius, for having made use of your name, and in my feeble way having attempted to describe your face and character. Flat burglary as ever was committed, was it not ? You must be aware that Bertram has no other correspondent. You can imagine, too, what a godsend your appearance on the stage must be to both of us. Heretofore my letters have been little else than small-beer chronicles, but the entrance of Miss Brosius gives me a subject fraught with great interest. As some reparation for the cool method in which I have introduced you to a stranger, I cannot do less than accede to the request I see in your eyes, and read you what Bertram has further to say :"

"Indeed it is a source of no little pleasure that I understand from your letter that you have broken through your reserve and made the acquaintance of so charming a young lady as I imagine Miss

Brosius to be. I find myself picturing her appearance, and gathering from your words some idea of her characteristics. Although you but hint it, I imagine that she is a *femme ingenue*—more rare than half the world imagines. In my travels through Arabia and India, and among some of the African colonies where one has been taught to believe this trait abounds, I have found positively none of the sex to whom I would apply the adjective. Such a character has a great charm for me, it is at once so rare and so admirable. Beside

the belles of society and fashion these modest, artless ones are attractive beyond measure. Now that you are so fortunate, Francois, I entreat you to cherish her acquaintance. The women of the present day who queen it in the *beau monde* seem rather to cultivate *hauteur* and repression than the graces of sincerity and the gentler attributes of the heart. It is a great temptation to desert my travels and come back and see this young girl in whom I have taken a wonderful interest. Write me more, I pray you, of this lady."

## TWO CELEBRATED CHARACTERS.

BY WALLACE R. STRUBLE.

WE find two of all the ancients whose lives to us seem thronged with the finest incidents of intellectual experience. We take these men to be instances of the most exquisite and intense happiness possible to be enjoyed on earth. They were men of more brain than anything else; which is to say, that they lived less in the outer world than in the inner. They were discoverers of new ideas and new forces. More than that, they time and again were discoverers overjoyed. We scarcely need hint that from the study of these two examples, the reader may derive many inspiring ideas and elevating lessons.

First, then, let us pay our attention to Pythagoras. Let us go back through the centuries and trace some incidents in the life of this great ancient. Thus to do is to gain at once a useful lesson, a valuable hint of the prime necessities of a good and useful life; it is to see a man who had come to be more than a mere user of his hands, and more than a mere gleaner with his mind, longing and toiling ever after the beautiful and grand of the yet unexplored parts of creation. All the noble things in the world have taken their origin in just such men as was Pythagoras of Samoa. For Pythagoras was an uncommon man, and his works were uncommon works.

He was the founder of a school of philosophy—the Italian school, so called. Yes, he was more than that: to use his own words in reply to King Leon, he was "*philosophos*"—a lover of learning—not "*sophas*"—a wise man; "for the Deity alone," he declared, "is worthy the title of *sage*." Let us pause upon this profession of Pythagoras,

the best that was ever made by man. We shall then be prepared to learn the greatest things about that majestic ancient, without thinking at all to ask, "How could this be so?"

At Crotona he built up a great unique society, composed of six hundred seekers with him after what Socrates in a later age called "the interior beauty of the soul." His opinion on any subject of thought was, while he lived, taken by all who learned of him, as authority weighty enough to supersede the necessity of proof. After his death his scholars paid him divine honors. These things are only natural corollaries of the life of an ancient lover of wisdom.

History tells us not all of the discoveries made by this "Fabulous Wonder-Man." We know that to his disciples he openly taught doctrines, aided by images and symbols, which seemed to them divine oracles. We know that he inculcated lessons in secret, dispensing with those aids which elevated the chosen ones who heard them into *Pythagoreans*. What these latter teachings were, we cannot know. Perhaps they contained the germs of great theories, which our times see in application; perhaps they embraced sublime truths in regard to God and immortality, which none of that far-off mythic age, but such as had purged their souls of all dross by a long-continued course of mental and moral discipline, were capable of understanding. There is no voice to settle these points. We do but know that in the secret place of his private and high instructions, Pythagoras communicated discoveries, which only he and those who, by having passed the trials prescribed

by him, had gained the privilege of hearing the familiar words of his wise lips, could feel the wonderful enchantment.

Such a man as this must have gone in thought many centuries ahead of his own. He was capable of thinking astonishingly, able to think on into future civilizations. What he saw in the beauty of reality, would doubtless have been sneered at by all his living cotemporaries, except those whom he had made in a good degree like himself. It is pleasant to imagine that lofty thinker, lingering in the enchanting silence of his own deep meditations and feeling thrills of rapture now and then, which could not but have still remained secrets of his own, even if he had tried to communicate them to others. We love to imagine him in his elevation of life, his quiet dignity, his impressive gravity, his temperance, his virtue, his self-control. We love to conceive of his face, showing in its paleness, not the want of bodily health, but the superiority of his restless mind. We love to think of him as abstaining habitually from animal food, and welcoming with a right relish nearly all vegetable. What pleasure to conceive of him as one among his pupils living in perfect concord; rising with them in the morning early enough to worship the outbursting sun; then determining how the day was to be spent; joining with them afterward in reciting Homeric verses, or in vocal singing, in order to fit his own and their mental powers for the severe activities soon to be entered upon; passing with them then into the intense tranquility of serious study; after several hours, pausing awhile for a solitary walk, in which the mind might indulge itself in happy contemplations; then mingling in cheerful conversation and in the performance of various gymnastic exercises; then going to dine on the common meal of bread, honey and water; afterward attending to public and domestic affairs, to bathing, and to the duties of religion; and then, as the last business before sleep, reviewing what had been done during the day. All this it pleases us to muse upon, in connection with the genius and works of that deep and mysterious man of history—Pythagoras. For thus we are taught that the most of his life was serenely and mightily intellectual.

Let us be cautious, right here, lest we forget that Pythagoras lived in an age when thinking was not so much of a practical and utilitarian process as it is in these days. So if we find, in the systems

which he built up out of his own discoveries, too many mild and subtle conceptions, going to indicate something of a habit of fanciful idealization, we will still have the utmost reverence for the great philosopher who professed himself to be a "lover of learning." Although his ideal masterpieces are more or less tinged with the mysticism of his mystic times, yet Pythagoras was the most practical explorer of nature of all that lived when he lived. What though he carried his reasonings about numbers beyond reason? Did he not discover the five regular geometrical bodies, the *cube*, *tetrahedron*, *octahedron*, *icosahedron* and *dodecahedron*, and did he not originate the multiplication table we use to-day? What though he extended his abstractions in regard to music into hopeless mathematical subtleties? Will any one deny that he developed musical proportions and laws, known, even in our times, to be as true as they are beautiful? What though he taught the absurd doctrine of the transmigration of souls? Must we not concede that he unfolded new and noble views in regard to the origin and destiny of man? What though he held certain theories of astronomy which, in our age, appear strangely unreasonable? Will we not have to grant that he was the first of the ancients to anticipate the system of Copernicus? Wonderful as it may seem, he believed that the sun is the centre of the planetary worlds, and that every star is a sun. He knew the causes of eclipses and how to predict them. He knew that the earth is round, and that its surface is naturally divided into five zones, and that the ecliptic is inclined to its equator, and that this same earth daily revolves on its axis, and yearly wheels around the sun. He had found good reasons for believing that the Milky Way gets its whiteness from the innumerable little stars which thickly cluster in it, and for believing that Lucifer and Hesperus were but the same beautiful Venus, bearing in the one case her morning, and in the other her evening name. And that same early astronomer, who so rightly read the "heavens of the Lord" without a telescope, could not fail even to see that the other worlds must, like ours, be inhabited by living and intelligent beings.

There may be much, and there may be but little of reality in that fine theory in regard to the heavenly spheres which has given a magical lustre to the name of Pythagoras, that theory which contemplates the solar system as arranged with such a

reference to number, distance and time, as to make it one great harmonious whole, giving forth, in the varied movements of its parts through the ether, musical tones of the most exquisite melody. Little of reality, or much of reality, we say, there may be in this gorgeous conception of a grand organ, made up of restless planets, spinning and glittering around a central sun, the mysterious intonations of which have been singing, in space, through all the ages; certain it is that it points to a sublime thoughtfulness, as the habitual peculiarity of the genius of its originator. He who, in an age when the human race was but in the twilight of civilization, could so look away from the earth into the heavens, and see the creation of God in such a light of almost entrancing beauty and glory; tell us, was he not worthy, simply in the view one must take of the joy of his experience, to have it said of him, that "he was the only mortal whom the gods had permitted to hear the harmony of the spheres?"

We can but imperfectly conceive how rich the intellectual felicities of Pythagoras must have been to him, and how satisfied he must have felt with them, as rewards of his patient labor of thought.

In the second place, let us dwell upon Archimedes. No man of science can hear with indifference the name of Archimedes, for that name is inseparable from science itself. From this man, this citizen of ancient Syracuse, there came forth into the world new scientific truths to change the aspects of civilization. He was a discoverer in more than one department of science. He was a mathematical discoverer. By methods depending on developments made by Archimedes, men to-day measure their curvilinear surfaces and solids. What a penetrating mind was his, that he should have caught sight of unique relations and laws, where a thousand other minds saw nothing! What an intellectual Midas was he, that whatever he put his thoughts upon should have shone with a dazzling gold!

It was for none but him to take up the sphere and the cylinder, and by the discovery of a surprising proportion existing between the solid contents of these two magnitudes, when each has a base and altitude equal to those of the other, to make them tell of the power of one ancient man's genius, to a generation of men more than two thousand years distant from his own. It was for none but him to take up the circle, and by devel-

oping the relation of its diameter to its circumference, to make it a charming celebrator of individual greatness, through all eras of subsequent history.

But, then, this said Archimedes, of whom we are speaking, was also a discoverer, and a great one too, in practical mechanics. He it was who developed the principle of the first compound pulley, and the first endless screw. His mind was full of mechanical theories, which he himself had constructed and proved true. He daily feasted his thoughts on discoveries made in solitude, by his ever-developing genius. The historians of the past, Polybius, Livy, Plutarch, each indulges himself in admiration of the Archimedean ingenuity, as displayed in the military machines which the great discoverer projected and set in operation, to repel the attacks of the Romans during the siege of Syracuse.

It is not known, and never will be known, how much of mechanics Archimedes carried in his mind, which he never found time or means to bring into light—how many wonderful arts he knew something of, which the circumstances of the times, or his own circumstances, would not permit him to see brought into useful play—how many vast machines lived in his brain, the wheels of which were silent to the world's ears forever. Like most, if not all, of the ancient discoverers, he himself had to be the one who realized the practical applications of his own great developments of natural law. In other words, he was both a discoverer and an inventor. And hence it was that when he had got hold of the theory of the compound pulley, he set himself to making a compound pulley; and when he discovered the principle of the screw, he went and made a screw; and when he found out the law, or laws, according to which some great war machine could be constructed, he looked about for the material and means by which to make it, and if he succeeded in finding them, really did make it. Not any living man can tell how many discoveries the wonderful Syracusan had made, by which it came to be suggested to his mind, that if he only had a place to stand in without it, he could stir the solid globe from its orbit; but it was known that he was a practical man, for all the world has learned the Archimedean cry, "Give me where to stand, and I will move the world!" If Archimedes died with good volumes of unrevealed mechanics

rolled up in his head, it must have been either from a want of patronage or because he had no point of available action to operate in.

But, then, Archimedes was a discoverer in still another field of science. We have many times read of his beautiful discovery in hydrostatics, and of the great holiday which took place in his soul over it. The reader need not to be told about King Hiero's order for a crown to be made of pure gold, and about the deceitful artist who added an alloy to it by fraud, and about him who, while taking a bath, seized hold of the splendid principle, then for the first time discovered, that a body immersed in a fluid loses just as much in weight as the weight of an equal volume of the fluid, and about the application this man immediately made of the principle he had thus caught sight of, by which application he was able to determine to what extent the King's crown of gold had been adulterated. The reader is already aware of the fact that when this man, Archimedes, had come to see, with certainty, what a fine discovery he had made, he was so filled with exultation, that, yielding to an impulse of wild and almost insane delight, he leaped at once from his bathing-tub and ran naked into the streets of Syracuse, shouting, "Eureka! Eureka! I have found it! I have found it!"

Shall we pause here, and attempt to describe the joyous ecstasy which must have more than filled the soul of that "glorious old heathen" then? To use the words of a gifted writer upon this very subject:

"Who can describe the Archimedean felicity? Not even Archimedes himself could have described it. The manner of its expression is all that can ever be portrayed. It would, indeed, seem that, in the hour of that mental triumph, the very faculties of the philosopher's mind had shaken off their usual restraints, and, with a beautiful manliness, like so many victors, were clapping their bright hands, and laughing their sublime rapture right out! And it is not at all unreasonable to think of him as so unspeakably happy, that even if the glory of the 'third heaven' had burst through the skies upon him, his soul could not have been made happier.

"But then it would be doing injustice to Archimedes, to suppose that this instance of intense pleasure was any other than a single one among many of a like kind, which were experienced

during his lifetime. I will not believe, and you will not believe, that when he had discovered the mutual relation existing between the sphere and cylinder, his eyes grew not radiant with the light of an indescribable joy, and his heart throbbed not with the wild motion of a great transport, and his lips told not of the tumult of bliss going on within him. History says, that, in order to immortalize this discovery, on which he himself set particular value, men placed on his tombstone a cylinder, with a sphere inscribed in it. Perhaps they did not imagine the real reason why he set such a special value on it; and, perhaps, again, they did conceive of that reason, well and truly. At all events, it shall give me delight to dream that they thus ornamented his monument, chiefly to perpetuate their own interest in that jubilee which he must have enjoyed in his soul, when he came to realize what a splendid triumph he had gained. And I can easily fancy that when Cicero, while acting as questor over Sicily, found this monument away back in a thicket, by which it was concealed, he fixed his philosophic eyes upon the cylinder and sphere which appeared upon it, and really exclaimed, 'What a rapture these symbols are carrying through history!'"

Why did Archimedes love, like Pythagoras, the seclusion of thought? Why, when the city of Syracuse had been taken possession of by the Romans under Marcellus, was he found sitting in the market-place, deeply absorbed in serene study over some geometrical figures he had drawn in the sand? Those superior pleasures, going to reward the labors of a mind devoted to discovery; these furnish the only satisfactory answer to all interrogatories of this kind!

"Disturb not my circle!" said he to the rough Roman soldier who came into his gentle presence to pierce him, and make his bright blood gush out over the ground. "Disturb not my circle!" Beautiful and yet melancholy saying! What a fine comment on that lovely tranquility of soul, which is the inheritance of the philosopher! What an endless perpetuator in human memories of the meanness of a mean soldier!

The brutal warrior saw no sublime meaning in the last words of Archimedes, and, as he pierced the peaceful man of science, had not soul enough to see that he was only opening a way for him to the perfection of that bliss of which he had already enjoyed so many happy foretastes.

## ANCIENT DYES.

By JOSIE KEEN.

PROBABLY all are familiar with the term Tyrian Purple, yet not, perhaps, as familiar with the antiquity of this valued dye, or of how near it came to be included among the "lost arts."

There are various theories as to its original discovery, yet we believe nothing really definite has been given. One writer says: "The famous and costly Tyrian purple, the royal color of the ancients, is said to have been discovered by the Tyrian Hercules, whose dog having by chance eaten a shell-fish called *purpura*, and returning to his master with his lips tinged with a purple color, it occasioned the discovery of this precious dye."

Purple, however, is much more ancient than this, since we find it mentioned by Moses in several places. Two kinds of purple are mentioned in the Old Testament; first, *argamon*, rendered in our version "purple," denoting a reddish purple obtained from a species of muscle or shell-fish found on the coast of the Mediterranean; second, *techeleth*, rendered in the English Bible "blue." This was a bluish or cerulean purple, likewise obtained from another species of shell-fish. The "scarlet," or "crimson," for the two words denote essentially the same color, was produced from the cocus insect, *cocus ilicis*. All these were sacred colors among the Jews, and the latter were used for the High Priest's ephod, and for veils, ribbons and cloths.

The purple of the ancients seems to have included many different tints derived originally from the shell-fish, and modified by various arts in which the Tyrians excelled. As each fish yielded but a few drops of coloring matter, the choicest purple bore a very high price. Purple robes were worn by the Kings and first Magistrates of ancient Rome, and Nero forbids their use by his subjects under pain of death. Our Saviour was clothed with a royal robe of purple in mockery of His title, "*The King of the Jews*."

We find from the Old Testament that Moses used much wool, dyed of a crimson and purple color, in the work of the tabernacle and in the ornaments of the High Priests. The Babylonians also, we are told, clothed their idols in robes of purple and azure color.

The purple dye of Tyre, which admits with great propriety of being included among the dyes of Greece and Rome, we learn was discovered about fifteen centuries before the Christian era, and the art of using it did not become lost until the eleventh century after Christ. It was obtained from two genera of a species of shell-fish, the smaller of which was denominated *buccinum*, the larger *purpura*, and to both the common name *murex* was applied.

One of our writers thus describes the process of coloring: "The dye stuff was procured by puncturing a vessel in the throat of the large genus, and by pounding the smaller entire. Having been thus extracted, salt was added, also a certain amount of water. The whole was then kept hot about eight or ten days in a vessel of lead or tin, the impurities as they arose being assiduously skimmed off. The dye stuff was now ready to receive the texture to be dyed, wool universally, and the operation of dyeing was simple enough; nothing further being required than the immersion of the wool for a sufficient time, when the whole of the coloring matter, at the expiration of this fixed period, was found to have been removed, and to have combined with the textile fabric.

The tints capable of being imparted by these dyes were various, representing numerous shades between purple and crimson. Amongst these a very dark violet shade was much esteemed, but the right imperial tint, we are informed, was that resembling coagulated blood. The color appears to have been very durable. Plutarch observes, in his "*Life of Alexander*," that at the taking of Tusa the Greeks found in the royal treasury of Darius a quantity of purple stuffs of the value of five thousand talents, which still retained its beauty, though it had lain there for one hundred and ninety years.

The discovery of Tyrian purple dye, as we have already said, is referred to the fifteenth century before Christ. That it was known to the Egyptians in the time of Moses, is sufficiently obvious from the testimony of more than one Scripture passage. Ultimately, in later ages, a restrictive policy of the Eastern Emperors caused the art to

be practiced by only a few individuals, and at last, about the twelfth century, when Byzantium was already suffering from attacks without and dissensions within, the secret of imparting the purple dye of Tyre became lost.

The rediscovery of this dye as it occurred in England was made by Mr. Cole of Bristol. About the latter end of the year 1683, this gentleman heard from two ladies residing at Minchhead that a person living somewhere on the coast of Ireland supported himself by marking, with a delicate crimson color, the fine linen of ladies and gentlemen sent him for that purpose, which color was the product of some liquid substance taken out of a shell-fish. This recital at once brought to the recollection of Mr. Cole the tradition of Tyrian purple; without delay he went in quest of the shell-fish, and after trying various kinds without success, his efforts were at length rewarded.

He found considerable quantities of the *buccinum* on the sea-coast of Somersetshire, and the opposite coast of South Wales. The fish being found, the next difficulty was to extract the dye, which in its natural state is not purple, but white, the purple tint being the result of exposure to the air. At length the acute investigator found the dye stuff in a white vein lying transversely in a little furrow or cleft next to the head of the fish. This, however, was but half the knowledge needed. He simply discovered the purple-yielding *buccinum*, leaving the discovery of the *purpura* to Mr. Duhamel in the year 1736—the juices from the two shells being necessary to impart the last and richest shade of purple.

Dr. Thomson, in his "Land and the Book," says: "That variety of the *murex* from which the far-famed Tyrian purple was obtained, was found all along the coast, but it abounds most around the Bay of Acra. So also the *Helix Janthina*, from which a blue, with a delicate purple or lilac tinge may be extracted, is equally abundant. After a storm in the winter you may gather thousands of them from the sandy beach south of Sidon. They are so extremely fragile that the waves soon grind them to dust.

"A kind of *Buccinum* is found here at Tyre, which has a dark crimson coloring matter about it, with a blueish livid tinge. According to ancient authors, this was used to vary the shades of purple. Pliny says the Tyrians ground the shells

in mills to get at the dye. This could not have been the only process, because the remnants of these shells found in pits along the southeastern shore of our island were actually broken, or mashed, and not ground; and the same is true of the shells found on the south of the wall of Sidon.

"This Tyrian purple dye was celebrated in Greece even in the remote ages of Homer, who sings of

'Belts,

That rich with Tyrian dye resplendent glowed.'

"The reference to those colors of red, purple and scarlet in the Bible are more ancient still; indeed, from Genesis to Revelations they are so numerous, and so mingled and blended together, that it is almost impossible to particularize them, nor is it necessary. The merest child can turn to a score of them; and these colors are equally prevalent and popular at the present day among all classes of Orientals."

A Biblical writer says: "The prediction that Issachar and Zebulon should 'suck of the abundance of the seas and of treasures hid in the sand,' is referred by some persons to those valuable mollusks, the *murices* and *purpura* from which the far famed dyes of antiquity were extracted. These mollusks were found in great abundance on the sea coast, near the country of Zebulon and Issachar; and those tribes doubtless participated with their Pagan neighbors, the Tyrians, in the lucrative traffic of the purple they yielded."

Pliny mentions two kinds of shells as furnishing this color, with which the Romans dyed their robes, the one *Buccinum*, the other *Murex*. The former has been identified by M. Lesson with the *Janthina fragilis* of modern naturalists. This shell floats on the sea in prodigious quantities. It is supported on the surface of air vesicles, which Pliny calls a glutinous wax, and the moment it retires under the water, allows a very pure and bright reddish purple color to escape. Each animal contains a considerable quantity of it in a dorsal vessel, and when mixed with alkalis, it readily assumes a green tint, confirmative of what Pliny states. Under the action of acids, the color of the *Janthina* passes to red, while the oxalate of ammonia gives it a precipitate of deep blue; and with nitrate of silver it yields a bright gray.

We are told "The dye called from its origin, 'the purple of the sea,' was always in great request

in the Oriental market, and the preparations by the Tyrians, in which they excelled, was a principal source of their ancient wealth and prosperity. Ezekiel mentions it as an article in the 'Fairs of Tyre' (Ezk. 27: 16), 'and the prosperity of Jacob might suck of the abundance of the sea,' in supplying the *murices*, with which their coasts abounded, to the dyers of that far-famed city. Lydia, who entertained Paul at Philippi, we know, was 'a seller of purple.' "

Dr. Wilde, who spent three days in exploring the remains of ancient Tyre, found, while examining those along the shore, a number of round holes cut in the solid sandstone rock, varying in size from that of an ordinary metal pot to that of a great boiler. Many of these holes were seven feet six inches in diameter, by eight feet deep, and some very small. They were perfectly smooth in the inside, and many of them were shaped exactly like a modern iron pot, broad and flat at the bottom, and narrowing at the top. Some were found detached, and others in a cluster; when the latter occurred, two or three of the holes were connected by a narrow channel cut through the stone about a foot deep. Many of these reservoirs were filled with a breccia of shells. In other places where the pots were empty, the breccia lay in heaps in the neighborhood, as well as along the shore of this part of the peninsula. It instantly struck this traveller, on seeing these apertures, that they were the vats, or mortars, in which the celebrated Tyrian purple dye was manufactured.

He was confirmed in this opinion by the fact that the species of shell discovered in the breccia corresponded exactly with that described by the old authors as that from which a purple dye can be obtained at the present day, as is acknowledged by naturalists. It is the *murex trunculus*.

Dr. Wilde broke up large quantities of these masses, but could in no instance find an unbroken specimen, which he certainly would have discovered had they been rolled in from the sea, or were in a fossilized state. He picked up one of the recent specimens from the shore, and found it to correspond in every respect with those in the conglomerate.

It would seem that the shells were collected in these holes, or, as they might more properly be called, mortars, in which they were pounded, for the purpose of extracting from them the juices which the animal contained; and this notion is

borne out by the statement of Pliny, who says: "When the Tyrians light upon any great purples, they take the fish out of the shell to get the blood; but the lesser fish they press and grind in certain mills, and so gather that rich humor which issues from them."

There is much obscurity in the passage, "Thine head upon thee is like Carmel, and the hair of thy head like purple; the king is held in the galleries" (Sol. 7: 5). The rendering of the passage, according to Parkhurst, is, "The hair of the head is like the purple of a king, bound up in the canals or troughs."

Alluding to these words, M. Goqnet says: "In Solomon's Song there is mentioned a royal purple at the dyers, dipped in the canals after having tied it in small bundles." To this statement is added, by way of note: "The best way of washing wools, after they are dyed, is to plunge them in running water. Probably the sacred author had this practice in view when he said they should dip the royal purple in canals." The note just quoted thus concludes: "As to what he adds, as to being 'tied in little bundles or pockets, one may conclude from the circumstance, that instead of making the cloth with white wool, and afterward putting the whole piece into the dye as we do now, they then followed another method. They began by dyeing the woolen skeins, and made it afterward into woolen stuffs.'"

This account well illustrates the comparison of a lady's hair to royal purple bound up in the canals, if we suppose, what is highly probable, that the Eastern ladies braided their hair in numerous tresses, perhaps with ribbons of purple and other colors, in a manner somewhat similar to the mode described by Lady Mary Wortley Montagu.

The wearing purple robes was a privilege of princes, and those who had their express permission for the purpose. This custom was also found in the latter times of the Roman Empire. When Commodus nominated Claudius Albinus Cæsar, he said to him, in the document sent to him for that purpose: "In order that you may wear upon you a sign of the imperial Majesty, I give you permission to wear a scarlet mantle in my presence; also, when you are in my house, to wear a purple one, only without gold." Cassidorus observes in one of his letters, that "a regent was known from all the rest by his purple robe, so that by a glance of him no man might mistake."

The phrase, "a vesture dipped in blood" (Rev. 19: 13), may probably contain an allusion to the vesture worn by the Roman generals, which was sometimes purple or scarlet. This was the garb in which they fought, and this circumstance is particularly recorded of Lucullus.

Among the divine instructions that Moses received was this: "Thou shalt make a vail of blue, and purple, and scarlet, and fine twined linen of cunning work" (Exodus 26: 31), and others were to the same effect. Thus the richest color adorned the veils of the tabernacle and the dresses of the High Priest. Even in the time of David to wear such robes was a privilege of royal birth; thus of Tamar it is said: "She had a garment of divers colors upon her, for with such robes were King's daughters, that were virgins, apparelled" (II. Sam. 13: 18).

It might be supposed, on a partial acquaintance with the subject, that high intelligence and no ordinary ability were required for the production of the richest colors known to art. But this is not the case. In a description which Dr. Kitto has given of the Kyhaulee Turkmans, he says: "When we bear in mind the frequent mention of rich dyes among the Israelites in their wandering state, it is of illustrative interest to learn that the Turkman women have great proficiency in the art of dyeing. Their colors are beautiful! Indigo and cochineal, which they purchase at Aleppo, afford their blue and red dyes; but the ingredients of all the others, especially of a peculiarly brilliant green, are from herbs which they gather in the mountains of Armenia; and the dyeing process is carefully preserved as a national secret. It is applied chiefly to the wool of which the carpets are made. The wool is of the ordinary kind; and the carpets, which are something like our hearth rugs, are but seven feet long by three broad, and sell at from fifteen to one hundred piastres each."

We find the terms *scarlet* and *crimson* are used by the prophet Isaiah according to our authorized version (Isaiah 1: 18). The Hebrew word translated *scarlet* denotes properly a bright red color much prized by the ancients. The Arabic word means "to shine," and the name is supposed to have been derived from the bright appearance of the color. Of Saul it is said, "he clothed the daughters of Israel in scarlet," our English word expressing the color thus intended. This color was

obtained from the eggs of the *coccus ilicis*, a small insect found on the leaves of the oak in Spain, and in the countries east of the Mediterranean.

"The cotton cloth was dipped in this color twice; and the word used to express it means also *double dyed*, from a word which denotes repetition. It was a more permanent color than that denoted by the term *crimson*. The word scarlet, in fact, indicates a deep-red slightly tinged with blue. Of Daniel it is said, 'they clothed him with scarlet' (Daniel 5: 29), a ceremony which, according to the custom of the East, was highly expressive of dignity; where to come out from the presence of a superior in a garment different from that in which a person went in, it was significant of approval and promotion."

It is a curious fact, says this same writer, "that the figures of two Tyrians have been discovered in one of the tombs of Thebes, arrayed in a dress of purple and scarlet, one-half of the person being clothed with the one, and the other half with the other. Both colors are extremely vivid, as the Greek and Latin writers represent them to have been. The scarlet part of the outer short mantle has upon it large purple spots which appear to have been formed during the process of dyeing either by sewing on patches of cloth of the shape of the spots, or by protecting the purple in these places from the reagent which turned the rest to scarlet."

"The mantle and tunic are both edged with a deep gold lace; and the whole forms a splendid dress, fully accordant with the luxury ascribed to the Tyrians (Ezekiel 27). The purple is, perhaps, a shade between China and azure blue; the red has the distinctness of scarlet, deepening into vermilion."

"It may be supposed that the colors of this garment are not to be taken as determining the exact shades employed in the works of Hiram, but as showing the nearest approximation which the pigments of the Egyptian artist allowed. It is, however, probable that they could obtain the exact tint when it was desired."

We would add, such facts and discoveries help us to better understand ancient customs and to more fully realize Bible truths as compared with them. And may they not also incite us to a deeper study of God's wonderful Book, so miraculously handed down to us?

## THE LANGUAGE OF JEWELS.

BY ALFRED B. STREET.

A SPARKLING wreath I send thee, rich and rare,  
Wrought of all jewels, with a band of gold  
Threading it, emblem of my love for thee,  
Love talks in flowers, where smile far Asian lands,  
Where first the Sun-god rises and which glows  
With all his fervor. Shall our colder clime  
Have not a language likewise? Not in flowers;  
They are too perishing in our misty skies!  
But jewels lasting as the sun himself,  
They hold a language speaking to the heart,  
And living till love leaves this world of ours,  
And first the Garnet, sign of Constancy,  
Keeping fond faith through all the storms of life;  
How rich its tint, like that which warms the west  
In lovely red! And next, the Amethyst,  
Blue as the eyes we love, and holding curb  
Over fierce passion, guarding the wild life  
From the fell wine-cup; then, the Bloodstone, hot  
In flame, yielding stern courage to fight through  
Life's battle; likewise wisdom to choose well  
Our pathway through the world. The Sapphire, next,  
Like the fresh robe of spring, and breathing meek,  
Of kindness that blunts every thorn and smooths  
All roughness from our way. The Emerald, then,

Hue of the ocean wave and emblem sweet  
Of love successful and the shrine of Home  
Beaming with bliss. The brindled Agate next,  
Sign of the almond-blossom lingering long  
Upon the brow of Age, Health's precious boon,  
And smiling fortune. Next the Ruby, rich  
As a girl's lips that melt upon the gaze  
And healing all the ranking wounds that friends  
Inflict upon the heart. Oh, blessing rare!  
Oh, balm divine from Comfort's heavenly cup!  
Next the Sardonyx, speaking soft and low,  
In unison with the emerald of the hearth  
Crowned with domestic love. The Crysolite  
Then beams, low whispering hope to dark despair,  
Joined to the Opal, likewise bright with hope.  
Next shines the Pearl, symbol of pity soft,  
Sweet Seraph, softest, sweetest of the host  
Ranged round the Great White Throne, and with her tears  
Blotting man's sins; and last, the Turquoise, like  
The Emerald, spreading in the path of love  
Her thornless roses. Wilt thou, loveliest, wear  
This wreath on that bright brow and make me thus  
Happy that heart responds to heart, and turns  
Life's desert to a flowery paradise?

## MEDITATIONS.

BY H. J. WALTERS.

THE iron voice from yonder spire has hush'd its hollow tone,  
And midnight finds me lying here in silence and alone;  
The cold moon through my window sheds its light upon the  
floor,  
With a wierd and pallid semblance that I never saw before;  
The winter wind comes to me with a soft and sadden'd lay,  
And laden with the sorrows of a long and weary day.  
The moonlight cannot rid me of the sickness here within,  
Nor whispering zephyrs waft away my bosom's weight of sin;  
Yet my heart and all its pulses seem so quietly at rest  
I scarcely feel their beating in my arms or in my breast;  
And my rounded limbs are resting so still upon the bed  
That one would think to see me thus, that I were lying dead.  
What if it 'twere so? What if I die? Yes, die, as I lie now,  
With something of fair Virtue's glow on this polluted brow?  
What if to-night—e'en now—with my soul so steeped in  
shame,  
From the Angel often wished for, the welcome summons  
came?  
Yet I am calm—calm as the clouds that float and slowly  
form,  
To give of their ghastly ramparts some fragments to the  
storm.  
Still, still I have no tears to shed; these eyelids have no  
store;  
The fountains once within me will be fountains nevermore.  
What if I die to-night, within this cursed, gilded hell,  
Upon whose scarlet trappings no virtuous gaze e'er fell?  
What would its soulless inmates do, if they should find me  
here  
With cheek too pale for Passion's smile, too cold for Pas-  
sion's tear?

Oh! one would come, and from these arms unclothe these  
bauble hands,  
Another wrench the jewels from my cold and pallid hands;  
This robe another's form would deck. Ah! yes! And long  
before  
The silvery moonlight came again to sleep upon the floor!  
And then in earth they'd lay me down where pauper's graves  
are made,  
And never mourning willow throws its melancholy shade.  
Ah! none will plant a flower on poor Luella's grave,  
Nor trim the tangl'd grass, no summer's wind can wave it;  
Oh! none will raise above me some sweet memorial tree,  
Nor drop a tear regretful o'er a fallen wretch like me.  
No friendly hand a stone will rear on my neglected mound,  
To mark it from the kindred sod in that unhallowed ground.  
What if so young, to-night I die—die e'en as I lie here,  
As many a green leaf wither'd 'ere summer's heat could  
sear.  
As many a spark expired ere it kindled in'to flame,  
As many a dew-drop vanished before the sunshine came?  
What if to-night—to-night I read these fostering bonds of  
clay,  
And seek in yonder moonlit sky the brighter, better day?  
Would my trembling soul e'er reach the mansions of the  
blest  
"Where the wicked cease from troubling and the weary are  
at rest?"  
Would the winged seraphs meet me, and beckon me to come,  
And join with them in anthems 'round that celestial throne?  
Would they clasp their hands in gladness when they saw my  
soul set free,  
And point, beside my mother, to a place reserved for me?

## THE FAIR PATRIOT OF THE REVOLUTION.

By DAVID MURDOCH.

## CHAPTER XXXVIII. THE WINGS OF A CHERUB.

THE hunted fugitives, whose place of refuge was as yet undiscovered by their enemies, were making the best of their condition under the ruling mind of Elsie. The barking of Rover, whose quick ear had heard the growl of the angry catamount a mile off, had produced alarm in the minds of all three; more especially as this was followed by the reports of firearms and the shouts of men engaged in the combat. Gradually as their fears subsided, they had time and opportunity of considering the peril and security of their present position. Elsie had reasons of her own for remaining where they had already slept so soundly; and the confidence with which she expressed herself had the effect of preserving the other two from painful uneasiness. Margaret, whose experience of the world was more than Angelica's, felt as if Elsie must know more of the means of escape than she expressed. Possessed of an elastic spirit, she bounded up the moment the smallest release was given.

A trifling occurrence in itself here took place, which gave variety and interest to their solitary condition. Rover, who had suddenly disappeared without leave of absence, was heard by the quick ear of Elsie to give one of his pleased and familiar barks, which he always gave to herself when he welcomed her home. This would have occasioned no alarm, but for her present circumstances, when she believed that that sly snake of an Indian, Shandaagan, was in the hills, seeking after them, and that Rover had always a hankering fondness after the keen hunter. Hushing her companions to silence, and pointing them to their bed, as the securest and most retired place of safety, she crawled off in the direction from which she was most likely to perceive the cause of alarm. Her surprise was increased by hearing the tinkling of a small bell that she felt more than distinguished to be one familiar to her ear. A moment more, and what was her amazement to find her own pet lamb, which had been driven away on the day of the conflagration to the hills, and now had found his way high up in search of food. The quick ear of Rover first discerned the tinkling of his play-

mate's music; and at the instant their mistress discovered them, they were fondling each other in perfect animal rapture. The dog, by his superior sagacity, was manœuvring so that he might bring the lamb where he knew a welcome awaited him; and the innocent little fellow seemed to know that friends were near; for he was following Rover, butting with his head, as if impatient of his gambols. Elsie stood up and gave the usual signal for Dickey's meal, when he rushed to her side with meek confidence, bleating his wishes and his pleasure, as she stroked him with her hand, and spoke Dutch: "*Arme Lammeshie, schoone Lammeshie*"—Poor lamb, beautiful lamb.

This new arrival was hailed with delight, and especially by the kind-hearted Angelica, who wept now when she spoke of her poverty as so great that she was not able to give poor Dickey his pan of milk. From that she naturally went off in a deep lamentation over the probable fate of Red and Brindle, and the mooly cow, wandering over the hills, with no one to milk them.

This trifling occurrence served to pass the day, giving employment in part to the good Angelica, and even diverting the mind of Margaret from herself; so that before night came on she had almost recovered her buoyancy of spirit in the communion she found with nature; into which she entered rapturously as every new and fresh object rose before her. Her education had all tended to foster these sentiments within her, so that her mind was not untutored for any time, but was prepared for all circumstances, and so trained that the present scenes rose up before her like dreams of the past rather than like unfamiliar pictures requiring minute investigation.

"I believe, Elsie," said the lofty-minded girl, "that I must have lived here before in some time of my previous existence; for everything I see is associated in my mind with some beautiful thing of the past. Elsie, did you ever think upon the life we came from in the past?"

"No, no, my dear Miss Clinton, I have had enough to think of in the present, and any spare thoughts are given to the life to come. This is the first time I have ever heard of a past life."

"Excuse my foolish talking, Elsie. I have read about it in some old book, and I sometimes dream of things which I may have seen. Your standing just now, with your brown October garments on, and your hand holding the lamb by his string, is just as plain to me as if I had seen you a hundred times before, my shepherdess. I am not surprised at all, as I would certainly be if something of the kind had not happened."

"If that be true, then," said Elsie, smiling, "being a queen is no new thing to you, for it sits well upon you. It would not suit us girls in this land, who are putting crowns of majesty alongside of witches' brooms, and other trinkets of the kind. Let it be as you will. You are queen, and I am your shepherdess, while this play lasts, which I hope will not be long. We must go soon to our bed. Let us gather all around, and speak of the good before we lie down in our nest."

Night came with more pleasure than it had done for a week past with Margaret. The scenes of danger were becoming common, and the presence of Elsie every moment more endearing. So rapidly and earnestly had her thoughts grasped the circumstances of her own case, and combined them with those of her companion, that they seemed as if linked in one bond for life and for death. She had known her a long while, for all the time they had been together they had lived in every sensation of their sentient nature, and in every thought of their rational being. With pious feelings and subdued affections, she lay down on the humble couch prepared for her by the tender-hearted mother, who saw the two young maidens laid beside each other as she tucked in the warm coverlets around them, saying, in homely phrase, what Elsie had said to her:

"Arme Lammeshie, schoone Lammeshie, de genade zij met se."

"What is that your good mother wishes for us? She is always thinking of us more than of herself. My trust is so strong when she is near me, I am confident her God hears prayer."

"She is calling us poor lambs, beautiful lambs, and saying grace over us."

The leaves of autumn, dry and in abundance, formed their soft bed, and sent forth a fragrant smell. Rover nestled in cosily at their feet on one side, and Dickey lay down as softly at the other. The stream came down, murmuring melancholy music above them, and was answered in

the din of the waterfall beneath. Lulled to sleep, they lay in more composure than princesses, who, after a night of dissipation, have musical instruments of all sorts played near their pillow. Our damsels, though hunted by wicked and barbarous men, were not haunted by the spectres which glide around the pillow of the evil conscience—never at ease, be it on a bed of flint or a couch of roses.

Night passed without interruption of any kind. Pleasant dreams even flitted through the brain of the hunted women. They lay down under no absorbing sinful emotions, and were therefore more calm in mind when sleep overtook them. In the morning, when Margeret awoke and found that her ever faithful Elsie was not beside her, she threw her arms around as a child does in search of its nurse. So dependent was she, that she felt more like an infant than the daughter of a soldier who had taught his children the necessity of self-reliance upon all occasions. But these were new scenes to the English girl, and there was not time yet, nor room allowed, to give scope to the real character she possessed. Turning round, she saw there was no one at her side, so sitting up, she called:

"Elsie, dear Elsie, where are you? Come and tell me that all is well. Oh! what shall become of me, now that my only friend is gone."

Angelica was also absent at that moment, but soon returned, wringing her hands in a transport of anxiety lest something terrible had befallen her daughter.

"Wat can I do for my dochter. Martin gone, ande my housen burned, the cows ande sheeps, ande niggers, alle agone. Awee! awee! Elshie, Elshie, vere are you dat you never come once?"

It was now that the spirit of the deserted Margeret came out in its true energy. Rousing herself up at the sound of distress, she forgot her own troubles, and wrapping around her the blanket she had worn as a mantle the previous day, she bathed her glowing temples in the fresh running stream as it passed clear over the rock. When fully equipped, she ran back to the disconsolate mother, saying:

"I am going off to look for Elsie, and I will not return till I find her. Sit down and watch till we come back."

The astonished Angelica was startled by the ardor of the delicate stranger, and looking up in her face, saw that she was sincere in her resolution:

but at the same time she knew that the attempt must be vain, and certain to result in the capture or death of one so feeble and inexperienced.

"Nay, nay," said the affectionate mother, "tee cannot do any such ting as dat, we shall go down de clove road togeder and meet Elsie coming up. If she be in the hands of de vile Shandaagan, we may help her, tree of us 'gainst von; but feeble ting dat tou be, vat can tee do?"

"O mother," said the excited girl, "have you not seen how a pigeon will swell out and speak boldly in its own language when an enemy comes to its nest. Let us go."

As the two feeble creatures were about to start, they knew not whither, they chanced to look over the precipice, when far down they saw two figures in the bed of the stream; one of them could hardly be distinguished as human, only that it stood erect, and was lifting up its arms to the very point on which they themselves both stood. The other figure Margaret soon perceived was Elsie, who had already parted from her unknown companion and was on her way back, with great haste, as if she saw the uneasiness which her absence was causing. These things occurring at the moment of their departure, made them pause sufficiently long for their friend and protector to reach them in time to set their minds at rest.

"Wat's dat down dere among de bushes?" was the earnest query of the mother to her daughter just as she put her head above the ledge.

"Never mind, mammy, here is a pipe and tobacco and some fresh dry punk for your tinder-box. The steel is in the red pouch at your side."

A pipe of fresh tobacco was just what Angelica needed at that instant for collecting her scattered senses; and so her mind was diverted from the vision that rose in the mist of the glen to the eyes of the amazed and disturbed woman. Margaret would fain have continued the inquiry, but perceiving the unwillingness of her friend to enter upon the subject, she, with the tact of good breeding, set about helping Elsie to spread out the meal that she had brought back with her upon the flat stone, which had hitherto served them as a table.

"What a fine breakfast you have brought us; beautiful white bread and milk; warm milk just from the cow. What I used to steal out and get in our dairy at home in England. Here I am drinking it on the side of these very mountains

that Hendrick Hudson saw when he came up the Great River."

"Yaw, mammy," said Elsie, addressing the old lady, "it is the milk of old Blackie. I met her mooing on the side of the hill for some one to milk her, and when she saw me, you would have cried to see how she ran to me."

The good Angelica was wiping her eyes at the account her daughter gave her; but the prudent girl went on so rapidly that there was no room to ask questions, and it evidently appeared to the quick-eyed Margaret that there were things behind which the caterer did not wish to tell. Her high spirits and quick motions had a sympathetic effect upon the others, so that by the time the mother's second pipe was over and the repast partaken of, there was even cheerfulness felt and shown by all. Rover had eaten up the crumbs and was watching a chance to dip his tongue into the hole where Dickey's milk was poured. Elsie was carefully gathering up the remains of the meal and putting them away in case of a dearth of food; while the reflecting Margeret was lost in reverie as she recalled the strange being she had seen that morning with her guardian; of whom it was evident she must remain in ignorance for the present. She however ventured to ask a question, as they all sat looking down through the intervening glade. "Is there no path down through the ravine there," said she, deferentially, "that we might follow and come to the river where this water is now going? My dear Elsie, it is surely better to risk some danger, than be pent up here in this high fortification and perish. I have heard soldiers say, that it was a maxim in war, that to remain and never show yourself was the sign of defeat, and sure to end in that at last."

"Ah, my lady," said Elsie, "you forget that the weak must have walls of defence, and what the wildcats up here have not in strength is given them in cunning and claws. Despair never effects any noble purpose. Let us wait another day up here in the sunshine, before we risk our lives down in the dark valley."

"All that sounds very philosophical in words, but I would be willing to venture into the dark, and get my feet bruised for the least chance of escape."

"A hundred Indians are lying across that road at this moment," said Elsie, with her hand pointed downward, "and every one of them has

the scent of the Spanish bloodhound that I have heard my uncle tell about. Do you think, Miss Clinton, that you could swim to an island, when the tide is sweeping everything out into the sea? could a hunted deer break through a closing rank of men and dogs watching for him in the thicket? I saw one, a beautiful creature, chased by a hundred hunters, and he took to the ice. The men and dogs, on the banks pursuing him, but he bounded forward at such a speed that I clapped my hands in perfect joy at the prospect of his escape, when a cunning hunter, who had lain down in the bushes, lifted his gun and gave him a fatal shot."

"You mean," said Margaret, with a sigh, "that I am a hunted deer, and that there is no hope for my escape?"

"No hope for you down through that path; by and by there may be. Go down at this moment, and you will be like a fish going into a fyke."

"And what is a fyke?" said the interested young lady, always wakened up by any new sound or scene.

"A net wide at one end like this clove, but closed at the other, and narrow, so that the fish cannot turn."

"That gives me but little hope, my friend, my protector, my adviser; but it seems, after all, that you are not without some hope. Maybe you would prefer me to mount the hill, and seek a refuge on High Peak as you call it. I am ready to go with you to any place."

"Come, Miss Clinton," said Elsie, anxious, to divert the mind of her ward from her present condition; "let us go out into the sunshine and finish that queen's robe we commenced yesterday. I have some thread that we can use in binding these leaves together, as Mother Eve did in her forlorn state. We are better off than she was in the Garden of Eden."

"I am sure," said Margaret, smiling at the conceit of her friend, "she had not more brilliant colors than we have in our paradise; though on the whole, I think her outward condition was a little better than ours to the feet."

"My lady, it is not the soft or hard walks which make the difference. Let us make the most of our place, and be the noblest of beings on the mountain."

"In this way the two maidens passed the early part of that day. Elsie made a crown of the laurel,

and set in it three feathers of sumach, which rendered it quite imperial. The sceptre was a peeled staff, surrounded with red and yellow leaves, tufted at the top with a deep purple knot. A wreath made of the same material, several yards in length, which when tied at the ends was thrown over the right shoulder, and biased so as to come on the left side, where the sword of state hung, made of shingle wood which they found floating down the stream. The lozenged blanket variegated with red and blue, had a hole cut in the centre, through which Margaret's head went, and having also outlets for her arms, it hung easily, not to say gracefully, upon her stately, aristocratic form; so that she really moved among these scenes more like the queen of the mountain in October than this description would justify.

"Hal!" said the enthusiastic lady, as she surveyed herself, laughing so that her face seemed like the sun struggling through the mist; "how the Duchess of Mourtelhome would envy me, were she to see me walking into the birthday masquerade. I will keep the pattern of this until I need it;" and with that she gave a few steps in the fashion of majesty, so that her companion laughed back, and with assumed obeisance bent the knee before her, while her queenship held out her hand to be kissed.

They had not got over the novelty of this amusement when they were attracted by a scream of eagles above them in the clouds, that were slowly resting on the mountain tops, where they sometimes lie for days like a fleecy turban round the head of an East Indian King.

"See," said Elsie, who was the first to speak, though not the first to perceive, "there is an eagle resting on that white cloud. He is calling to his mate, for he sees where he may find her a dainty bit."

"Hush!" said Margaret, "let him rest there till I see him a little more. His voice is that of true love. Let us listen. How calmly he sits up there undisturbed; his head is above the mist; and he only seeks glimpses of the earth. The hand of the fowler cannot reach him. Like the war-horse of Job, he mocketh at fear, and is not affrighted. He smelleth the battle afar off."

"Yes, Miss Clinton, he scents his dinner, and not very far off either, if I may judge from the growling of a wolf that I hear below us, with the quarreling of other creatures. The shots we

heard yesterday left carcasses lying there, and both beasts and birds soon find out the place."

"I become terrified at your telling me these things as I look below; but I feel strong looking up to that majestic creature. Have you seen him ever before?"

"Oh, dear lady, he has his home up there in High Peak, from spring till the winter comes near, when his mate and he, with the young ones which they have raised during the summer, go away to some warmer climate. The Dominie says they will not stop till they reach the Andes. They know the seasons better than any old man in the country, and can find a dinner where the cunningest fox in the hills has hidden it. The Dominie preached us a fine sermon not long since from the Dutch text, 'wan alwaar het doode ligchaam zal zijn, daar zullen de arender vorgaerd worden.' It is about the carcass gathering the eagles. And it was terrible to hear the good man lifting his hand, saying, 'wherever there is a carcass, there is a bird to tear it open. Vengeance follows the guilty like instinct; cross the sea, ascend the mountain, dive into the whirlpool, there is the eagle hovering over him, ready to alight upon him. No sooner is the wicked act performed than the fatal flap of the wing follows.' But I see you are up in the clouds just now, and I must wait till you come down."

"Oh, yes, excuse me Elsie, for not listening to you. How grandly he moves. Like a ship far out at sea with sails unfurled. I could trust myself on his wings, and be free. He would lay me down at my mother's side. What is that you said about the Dominie and the eagle?"

"Doth the eagle mount at thy command, and make her nest on high? From thence she seeketh her prey; and her eyes behold afar off." So Elsie quoted, adding: "the Dominie says that 'the Creator who gave power to the eagle, can give freedom to the country.'"

"Ah very true, dear Elsie, but the eagle has been the sign of tyranny as frequently as of freedom; and he is a cruel, bloody bird, though he be a true king up there, and everywhere. I wish from my soul I were on his wings. See, he narrows his circles, and there he seems to sit unmoved upon the air."

"Wait my Lady Margaret, and you will see him alighting soon. His eye is fixed on some object below; and he will dart down like an arrow upon it."

Elsie was mistaken in her conjecture, for while the kingly bird did come down, it was to alight on a tree that stood on the south side of the ravine, where he sat pluming himself with evident pride, stretching out his high neck over the precipice. The two spectators watched him for an hour till their eyes grew tired. Margaret's, especially, melted into tears at his movements, so natural and graceful, and at the same time evincing such power. Elsie, who had not the same interest in the bird, made while she sat a wreath for herself, and was in the act of throwing it over her head when a scream from her mother, and a howl of distress from Rover, made her run to the rescue; Margaret following with equal speed. When they arrived at the spot where Angelica was, confusion spread on all sides, of what nature neither of the two damsels could tell. There was the mother, the chief figure in the foreground, with Rover and Dickey at her right and left; but the most confounding thing of the whole was to see the eagle in front, striking and flapping his wings with the utmost fury at all three; and but for the prompt arrival of new forces, he must have come off the conqueror.

The history of the battle, when they came to tell it in order, was this. The eagle had seen from his eyrie, the lamb playing around the platform, and made up his mind to carry him off captive; but like a cautious soldier, he determined on stratagem rather than upon attack in face of the enemy; so sitting down before the fortress, he resolved to bide his time. At one spring, and as quietly as a cat, he descended, putting his talons into Dickey's wool, and was in the act of lifting him up, when Rover, with true courage and self-sacrifice, ran to the help of his playfellow, seizing the eagle by the wing, and holding him to the ground. The brave bird, nothing daunted, let go the lamb, and turned on the dog with beak and talons, which made him yell and try to get off in retreat, which the enemy had no mind to allow; still keeping at him, since the woolly victim had fled. By this time the eagle deemed that dog-meat was better than none, so he was in the act of lifting up poor Rover in the air, when Angelica arrived on the battle-ground; and seeing her favorite struggling to be free, she rushed forward, seizing Rover by the tail. The eagle soon found that able as he was to lift either of the two four-footed creatures, it was more than he had bargained for when a heavy Dutch vrow had taken forcible possession of

the tail end of his prey. It was at this part of the contest that Elsie arrived, who, finding that the weapons of the enemy were so sharp that they drew blood at every stroke, made an effort to seize him at once by the neck, which she by a dexterous turn, caught in her hand, choking him so that his beak became helpless. Here Margaret came on with one of Angelica's thick quilted petticoats, which she threw around him, while the old lady, with great presence of mind, took the garters from her own legs, and bound those of the discomfited bird of Jove, so that he became nearly as helpless as one of her own gobblers on his way to the Dominie's for his Christmas dinner. Conquered, though still defiant, he lay on his side, casting fiery glances at his vanquishers, who, from the fright and the battle were in a state of great excitement.

"What shall we now do with him?" was the question which came simultaneously from the conquerors. Margaret was for setting him free at once, remembering her own imprisonment.

"I cannot," said she in her enthusiasm, "see such a bold and noble creature in chains. You may not have read of a great man like your own Washington, but I must say it, of one who delivered his country from vassalage, William Tell, who was celebrated for his marksmanship, so that he could sever an apple with his arrow at a hundred paces' distance. When out on his native hills, he saw an eagle wheeling in aerial circles above his head. With the instinctive ambition of a huntsman, he put the bolt upon the string, which all knew would have brought the king of birds down to the earth, but in a moment he let the weapon fall from his hand, shouting, 'Liberty! liberty!'"

Angelica, who had none of that kind of sentiment in her composition, was for chopping off his head at once, like any common hawk's found in a barnyard trap.

"Te wicked tief dat he is; noting betters serve him dan drink and lap lamb's blood; wid my mind izijn hoofd willende be gebragt in een' schotel like Johannes den Dooper."

"Mammy, that is not like you. His head on a charger, like that of John the Baptist! You may live through this day and see the prophecy fulfilled—to the 'woman was given the two wings of a great eagle, that she might fly into the wilderness, into her place where she was nourished for a time from the face of the serpent.' I could read that

in Dutch to you, mammy, for Dutch is the true language to teach the robber a lesson, at the same time, and make some sport."

"As the Philistines did," said Margaret, rather pettishly, "not been carried out. But he would serve to pass the time, fully, and mounting into the air, he grew on the verge of the sheaf. Coming down, she left him not spreading his wings, full six feet, while his head stood erect the spring of his limbs was lost. His noble pride a prisoner, still on his keepers. Margaret, in a moment's sight, and forgot for the time, exclaiming, as she clapped her hands."

"What a tale to tell if I ever that I helped to capture the bird!"

"It is a good omen, my dear," responded, "that you will catch the tyrant seeking to devour you is overcome."

"Yaw, yaw," said Angelica, "and he prevailed not, neder meer in den hemel."

"Many thanks to you both for your words of hope. God may be so!"

"Yaw, yaw," said the pious woman, "always at good things; 'Satan in Gabriel's wings caught in the snare'—dat is de bottomless prayer."

"You see, Miss Clinton, how favorable this morning, and your doing any rash act till the day arrives, and then it will be done up to our ability."

#### CHAPTER XXXIX. THE

THEIR great exploit with its subjects of sufficient interest of all three for a whole day's time which Elsie was so desirous that the mind of her charge be diverted from herself. Margaret favored one. Neither Elsie came near to him without making which he sent out like a

thusiast was enraptured; taking pleasure in feeding him, and even ventured to stroke down the plumage of his neck. Climbing up on the tree beside him became one of her new lessons in mountain gymnastics; so that she came at length to swing on the branches that overhung the glen with delight rather than with fear.

The sun had by this time ascended nearly to the meridian, when Elsie spread their table once more, and insisted upon their partaking with her of a dinner she had kept for them in the basket, from the morning's repast. There was broiled chicken and roasted venison, with plenty of home-made bread. The mountain air and the hard fight had given them a keen appetite, so that the meal was relished by all three women and their three companions, dog, lamb, and eagle—each feeding her own charge. Elsie had one more surprise for them; a small bottle of the purest port wine, which cheered the hearts of all.

"One might believe, my dear Elsie, that the eagles of Elijah have been supplying your basket this morning; and if so, we have made an ungrateful return in capturing one of our friends there."

"My dear lady, we cannot always tell how our commonest blessings reach us; and it is best for us not to know all in one day."

"Eat as de Dominie says, asking none questions for de stomach's sake, vat is set before tee." Having said this, the old mother looked around for Rover; but though she called to him in her kindest and most persuasive tone, he did not answer. Elsie showed most excitement of the three; starting to her feet as if she waited for some apparition. If so, it was not certainly the one that came up; for on a sudden Rover came in sight, followed by that unworthy dog Shandaagan, who took his stand upon a rocky point above the platform where they stood. The caitiff grinned a scornful smile, as he tried to look into the faces of the disconcerted women, who knew too well that he was but the shadow of another whom they both hated and dreaded still more than himself. As they feared, Kiskataam came in sight a minute afterward, uttering his usual ugh! of grim gratification at the success of his hunt.

Margaret gave a shudder of mingled fear and disgust, recalling in feeling, as in memory, the torments she had endured since she had been kidnapped from the ship. After looking aside, as if she expected yet another besides these two, she

turned her back to the dizzy precipice, standing as near to it as safety would allow; her face lighted up with a courage and defiance which made the human tiger turn his eyes away, conscious of his weakness in the presence of virtue. To relieve his growing embarrassment, he ventured to address the young lady, more to keep his own courage up than in any hope of daunting her determination.

"Will the Fawn run now, or wait to be eaten up by the big teeth of the red wolf? His feet are on the trail of the weak Fawn. He will be down in the length of ten arrows. Let the Fawn run now with the Indian. He will carry her to the big canoe down there, and put her beside the great soldier and his squaw."

This artful speech, delivered in the softest tones, and with his finger pointing down the clove to where the river is almost seen, was well calculated to make an impression on a young female, imprisoned among strange scenes, and trembling still more in the prospect of being captured by one that she hated with a perfect hatred. Had any other man on earth offered her the same convoy she would have accepted of it; but she had proved his hypocrisy already, and was not a moment in deciding against the proffered help. Elsie, who had been watching the movements of her countenance with the keenest scrutiny, was prepared to thwart the sinister purpose, had there been any wavering on the part of her ward. But the hesitation, if any, was but for a moment; for the face of the captive assumed the most ineffable scorn, which the wily serpent interpreted without requiring verbal expression, which provoked the savage more than a torrent of words. These feeble women, even the simple Angelica, had put on a calmness which confounded their enemy, and rendered him almost mad; all the more because he expected to hear the voice of Clifford in the rear every moment. Whatever, therefore, he had to do for himself, must be done quickly. Perceiving that Elsie was the prime mover of Miss Clinton's action, he tried that string, gently at first, as if conscious of the tenderness beneath. Knowing from past experience that the least scratch of an unsheathed claw would bring upon him a storm, before which he must retire, he partly addressed both the young women, as he said, in his most smiling way:

"The Boerman's young Wildcat will go with the Fawn. Shandaagan is good Indian hunter."

Elsie had not the self-restraint of Miss Clinton. Having always full freedom at home, her speech was ever the ready utterance of her feelings, and now that her contempt for the mean red-skin was so deep, it was all she could say to bid him—

“Go off to Stony Clove, where the squaws are lying hungry beside their papooses, whimpering for their double-tongued daddies.”

A flash of savage passion crossed the face of the smooth deceiver, when he leaped down on the step beneath, along with his attendant, coming up close to the very spot where the three females were standing, with their faces toward their enemies. Elsie was all alert, and whispering to her mother to keep an eye on one savage, she took the chief to herself. In the front of Miss Clinton she kept Kiskataam at bay. On the other hand, Shandaagan was pressing forward with the evident intention of pushing the old lady aside, so that he might aid his master in securing Elsie, who was the one most to be dreaded. But Angelica had not stood so long unprepared, for with a stone in her strong hand, she struck the skull of the Indian such an unexpected blow that he reeled, and all but fell. A moment more, and his tomahawk would have done its work on her head, when Rover seized the calf of his leg from behind, giving it a bite which would have made a white man scream; this gave the old lady a chance with another stone to strike the hand that held the weapon of death, when he let it fall just at her feet. She picked it up so aptly that the coward sprang back, and wreaked his vengeance by a kick on the dog's ribs, which added to the music of the day.

In the meantime, the Indian chief was pressing hard upon Elsie, whose courage was rising equal to the emergency, as she prepared for the worst, though it was not the intention of the wily foe to do more than frighten her into compliance, since he could not wheedle them into his charge. He said fiercely:

“Does the Wildcat seek a lead nut through her brown hair,” as he pointed the muzzle of his gun in the direction of the brave girl's breast, who, not in the least daunted, to the evident surprise of the enemy, drew from her bosom, where it lay concealed, a beautiful silver-mounted pistol, armed with a small dagger, that flew out at the touch of a spring.

“Does the bloody Catamount want a ball

through his false heart? L nearer and there are two re

Foiled alike in his attempt, he was frightening these feeble women to wit's end, and was evidently in a desperate, when, to the surprise of the chief actor in this sudden scene, he suddenly upon the stage. So that ran across the ravine at a gallop, looked down upon the whole scene, and a hesitation which a man of some honor, may when he sees the victim of his conscience tells him that he has lost his own esteem. He stood upon his feet, not unlike the eagle upon the lamb, hating the man, and with a satiable appetite to devour. It was the arrival of Clifford in the midst of Kiskataam. His intention was, at that moment, to carry off Miss Clinton, taken her back into the wilderness, rather than not be revenged upon her, would have set her down where he whence he abducted her. He had made with the unpriest, been nursing his vengeance, on the night of his arrival; his schemes were blown aside, and the prize to the one who had been using his teeth with rage at him, had no alternative but to seem to yield, by showing master's interest, so that even said:

“De Yudas petray his m

“Miss Clinton, I have waited after an eternity of anxiety of the cold, passionate hypocrisy of the fox with the cunning of the fox with the well do you hide, and so I move.”

With these words, he bowed with deference to beauty and save the most knowing in the crowd could have guessed that at surface but the purest stream, bow the lady gave no further toward him, watching his

“Miss Clinton,” said the nearer and standing quite

the others were grouped, for all were waiting his motion; "you look in that dress as if you were prepared to come with me to the place where Nature is exhibited on her greatest scale, and when I have you there, standing in the island that divides the tumbling waters, a poet would call you the genius of Niagara."

Margaret had been so absorbed in the events of the morning, up to this moment, that her fantastic attire was the least of her thoughts, but being now reminded of that, and casting a rapid glance over her person, a slight blush tinged her cheek as she reflected on her folly in the midst of her distress, but this was no time to be affected by trifles; important realities called for action, and for endurance; now she could neither be flattered nor frightened out of her chaste dignity, by the man who had tried before this to fascinate her, as the snake draws the helpless bird into his jaws.

"Miss Clinton," repeated the artful seducer, "you never in the days of your greatest beauty, in the brilliant assemblies we have attended together, looked half so queenly as now, standing amidst all that rugged grandeur around you, and yourself so seemly in the trappings of that holy nature you love so well. Could you but see the great lakes of the North and of the West, your spirits would expand to a breadth which you are as yet a stranger to."

"Defile not the pure air around you with such flattery. Your breath is hateful to me; I hate the pure things you put your praise upon; I have become tame, and tired of my childish romance, since it has cost me so dearly already. My liberty has been bartered for it, and before night falls, my life may be the sacrifice. But, thank God, my virtue still remains and"—

"May not," interrupted the smooth sinner, "virtue and love dwell together in a cottage, while romance would ride out in company on play-days? I remember some such sentiment sung, in a home we wot of. Our own Shenstone, you know, sings:

"I have found out a gift for my fair,  
I have found where the wood pigeons breed."

"No more!" said the impatient lady; "you have touched the wrong chord; I will sing the real truth, as Shenstone sung:

"'Tis his with mock passions to glow,  
'Tis his with smooth tales to unfold;  
How her face is as white as the snow,  
And her bosom be sure is as cold."

VOL. IX.—24

With that he leaped down on to the same platform where the three fugitives and the two Indians were already standing. Margaret stood in the centre, her autumnal crown on her head, the wreath around her person, in a diagonal direction, and her blanket robe bound at the waist by another wreath of willow twigs, that confined it, so that she moved without tripping on the skirts. As she saw Clifford approaching her, she exclaimed, with more force than could be expected of her:

"Stand back, wretched man; God has still provided me with a retreat, that I may escape from your hands."

"God himself cannot save you now, Miss Clinton. See on either side of you my two faithful servants, the brave Indian chief Kiskataam, and the cunning Shandaagan, and behind you is the roaring fall. You see that that Providence you speak of has delivered you into my hand. Surrender at will is your true courage now, and you may make your own terms. Margaret, in yielding to your fate, you conquer your conqueror."

With these half earnest words, said in a seriolight manner, the bad man took a step nearer, partly bending himself forward, taking off his cap as in deference to the presence of a queen; while the whole group presented a picture worthy of a painter's eye. It was well that a pause was taking place, since it gave time for the working of those passions within which ever gain force as they are restrained, and the time given allowed Elsie an opportunity of reflecting on the critical position of her friend. Her bosom heaved, as the veins of her neck swelled, her whole frame expanded a size which seemed above common, and yet there was a symmetry of proportion which filled the mind more than the eye.

"Stand back, caitiff!" was the frantic exclamation of Miss Clinton to the still approaching Clifford. "Stand back! Soldier though you be, you are a coward, in attacking women, and I will not trust myself in your hand. I have at least one chance of escape."

With this she sprang up into the tree at her back, climbing to the branch on which Aurelius stood, welcoming her with his curved neck and spreading wings as if he invited her to her chariot; she sat out on the branch swinging over the deep gulf, making the heads of all but herself dizzy.

"For God's sake, Miss Clinton, do not tempt Providence in that way; come down, and I swear

by my honor, that you may go where you please rather than have your blood on my hands."

"I will not trust a man whose cheek grows pale at the sight of death, and calling himself a soldier; first mocking God, and the next moment invoking his name, then swearing by an honor that has been tarnished by ingratitude and violated friendship."

The blood came back to the face of Clifford at these reproaches. He was mad, and knew not how to wreak his vengeance, or on whom. He felt himself weak in the presence of such daring as he saw. Besides, the scene before him, wild and romantic, had a charm which captivated his cultivated and experienced eye. Margaret was dressed in her queenly robes, and unconscious of her beauty at the moment. Her face flushed, her hair hanging loose on her shoulders, she stood balancing herself on the branch with one hand on the proud eagle's neck and the other ready to loosen the string that bound him to the tree. Clifford, at the moment, would have given all he called his own to have had the lady at his command, whose spirit so proudly defied him.

"Clifford," she called out in transport, "you see that the God you mocked has provided for me a way of escape; I am not without a friend since I can rise on this noble creature's wings."

"For the love of God, Miss Clinton, do not think of trusting yourself thereon. I swear on my knee that you may do as you please, only come down."

"I will trust the eagle before I will an ungrateful and dishonorable man misnamed soldier and unworthy of his flag. I feel safe. I am not the first that has been thrust upon a pinnacle, and who came down safe in angels' charge."

All this time the noble Aurelius was excited to the highest degree, by the loud speaking and the gestures of the different parties. He felt the sympathy of human passion, in which he joined so fiercely that he kept the soldier in check, by his fluttering and his screaming. It would have been more than a strong man durst have done to venture without arms near to him. Without measuring the full strength, skill and rapidity of such an enemy, Clifford made a spring at the eagle, hoping to bring him down, and thus cool the ardor of his mistress, but before he could seize his feet the proud creature, quick as thought, struck the intruder's cheek with his beak below

the eye, for which he aimed with a force and a pain which drew tears, as he stood the while in anger and contempt. His rage now up, and pausing a moment for force, he said:

"Miss Clinton, I have since you will not yield your protector must pay the penalty Majesty's servants."

With that he leveled his pistol of putting a ball through Quick as a flash, Elsie stepped the muzzle aside, when the ball fell in the gulf below. The hero in a transport of fury, looked at the brave Dutch girl, whom he had before, and who now stood before him as he demanded, "Who is my game?"

"No soldier of King George's sign of my country in my hand," he promptly answered.

"Ah," said the mortified girl, "you got a young rebel Whig up to the line and beyond the lines too; bind these rebellious arms with old Abiel and Schuyler's arms will serve as maid of honor there; I see she wears her

During the excitement the three men had closed round the women, and seemed about to charge. Angelica had a dagger for her foe in one hand and a hawk in the other. Elsie had the trigger of her pistol and was wound up to the highest pitch to court the chance of trial rather than to fear it. If she could have done more freely, as when stepping out of a balloon, in which she had been, with eye and hand firm, she would have sprung the instant hazard of her person; when it came out of the rocks:

"Clifford! coward! sworn enemy."

The apparition was not

sudden alarm of the parties; though it was a human form that stood before them and a human voice that spoke to them. It was human, but dressed in bear-skins, with a high crowned hat of the same material; the face, rough with hair, seemed as if the same animal had provided the man with a beard from his jaws. Standing erect on the north side of the shelf, the figure confronted the three men, who stood waiting for the next movement. The Indians fell back to the upper side, while Clifford moved to the south extremity of the platform confronting his new foe. The stream of water, shallow at the time, ran between them; while the females standing with their backs to the precipice, were about equal distance from the two men, who were already eyeing each other as malignant enemies ever do, when suddenly brought face to face. As soon as Clifford sufficiently recovered himself, he demanded, haughtily:

"Who dares to insult a king's officer on duty or to interfere with the king's business in any way? or what menial in an idiot's garb has the temerity to call Colonel Clifford a coward."

"His duty! the villain's duty! ha! ha, ha!"

The laugh froze the blood of even the stolid Indians, who looked on as if they had been turned to stone. "Your duty to employ a savage to decoy an enthusiastic, artless maiden into your toils! The child of your best friend, the man who defended your black name from eternal disgrace. Your duty! to hunt after women as tigers are circled round! Duty!" and the figure laughed again in scorn, until it seemed as if the echoes were the responding of the fiends from the pit of damnation. So voluble and full were the answers from up the clove that Clifford, though accustomed to the scenes of danger, shrank from the voices that called upon his conscience to reply and defend himself against those superstitions which were unmanning him.

"Fool that I am," he burst out, "to be foiled of my purpose by a madman, spook, or wizard; I have heard of you before. This is too much, and a dose of powder and lead must silence your gibberish. See if you are witch enough to catch that in your skull cap."

And with that there was a flash and a report. The ball pierced the high hat of the strange being, bringing it to the rock; and when the smoke passed away, the soldier was waiting to see the

effect of his fire, when to his utter amazement the rough robe of the figure had also dropped off even to his beard, and there, instead of a maniac, stood an officer of his Majesty's Thirteenth Regiment of Foot, in his undress, fully armed and equipped for battle; all except that his head was bare. Great beads of perspiration broke out on the brow of Clifford, while his lower jaw fell as if smitten by death, and his lips involuntarily muttered, "Calderwood."

"Thank you, Clifford, for that shot," were the first words of the unveiled man. "See, here is a better mark for you. Aim at this star, won by your side on the banks of the Hoogly. Aim at it, for it lies on the heart you have already riven asunder. Two full years ago, I warned you of the coming day of vengeance. It has arrived. There is a just God in the heavens."

At this part of the action, going on in that lately solitary chamber of nature, the different parties who had been collecting from all sides, were arriving, so as to surround the little, but perfect water-fall. The ledge of the rock served as a stage on which the main actors stood, while all around, at different points, were the spectators. Down the stream, and looking upward, were the mock Indians, gaping in astonishment. The Mohawks stood on the sides of the gulf like statues of bronze, gazing on the marvelous scene. The officers on parole who were in pursuit of game, came in from above; while Cuffee and his crew were perched like crows on the high trees outside of all. They were rooks in a gallery of nature.

The now unveiled and chief actor gave a glance of grim satisfaction around him, saying, "One of us must die. Surely, the brave Clifford, whose praises have been sung by the belles of St. James, will not show the white feather. You coward! you seducer, you ingrate, can you not be provoked; can the blood of the proud Clifford not start at the epithet coward!"

The petrified and quivering sinner at this leaped as if he had been stung, and looking up, he cried with a husky voice, "It shall never be said of Clifford that he feared death at the hand of any man: I am ready."

The two combatants stood at the extremes of that stage; the Indians on one side, and the women on the other, so that the balls must pass between them. Elsie grasped her pistol tighter

for she had a terrible purpose in her mind, in the event of one falling. Margaret bent forward from her seat, so steadily that her plumes did not quiver; but the pious Angelica hid her face in earnest prayer, as she thought of an immortal soul passing in blood to the presence of the Great Judge. The red men dilated their eyes to the utmost but stood in an evident transport of expectation that showed an inward pleasure, whatever might be the result.

The deadly weapons were raised: a flash and a report, and a fall. It was the conscience stricken Clifford. Calderwood ran forward with his sword drawn, for he feared the treachery of the deceiver; but he soon found that it was needless, for the ball had struck the right arm below the shoulder, shattering the bone.

"I bargained for nothing less than life," said the enraged Calderwood. "Confess to be a liar or die. The steel is at your throat."

"Never! never!" was the bitter reply of the vanquished but still unhumbled man. The foot of the victor was on his breast, and the weapon ready for the last plunge, when it was thrust aside by a powerful arm from behind. It was Brandt, attracted by the reports of the pistols, and just in time to save the life of his companion in arms.

#### CHAPTER XL. PAWN'S LEAP.

WHILE the grand tragedy recorded in the last chapter was acting, the spectators, as if spell-bound, stood waiting the issue. A common feeling of horror and surprise pervaded all. It was one of those seasons when the mind grasps the whole at a glance, the daring—the danger and the sublimity of the position which the young lady had taken, and where she sat with such grace and majesty. The other figures in the foreground were ranged according to their place. But the fear entertained by all, lest the fatal leap might be taken, overwhelmed every other emotion.

Every one was relieved and drew a deep breath when the danger was past. The villainous pursuer had fallen, and they had time to follow out the doings of the rest. The most prominent were four men dressed in the assumed Indian garb; one of them, without any previous warning, seized the vile Kiskataam with a vigor and skill that nearly overcame him at once. But that traitor was no common enemy. The savage saw that the cup of death was put to his lips and he resolved to

sell his life dear, and then of his fathers in company gulf toward which he was gripped by Bertram, he deterred the young Englishman with his sword. Seeing that the lady from the forest had recognized her lover, he gave a shout at the agony she was in, and then it was impossible to elude the fate which he aimed at, and which Bertram did not see. Like a serpent around a tree, he was bound by a serpent, the snake coiled round his body, but with a sudden leap upon his feet, he bit the serpent who received as suddenly a practiced wrestler, broke the rock with a crash that made the bone in his body was in time to recover his scattered hand and foot, and left him in a stoical indifference, waiting for death. His saw was now sealed.

During these fierce combats Margaret and Elsie were waiting in tension. A double beat of the drum was felt by both as the four young men came on the stage of action, disguised for then they really deemed themselves but the quick eye of Elsie saw that Teunis was present, and that he had brought friends.

"Courage, my lady," said Margaret. "deliverance has come at last, still till the battle is over we can wait."

And there they remained until the tree was conquered. Clarence fell from the tree on which his noose was fastened, pale as death. The blood fell nearly fainting in her arms, she showed no sluggishness. On the side of Elsie, he grasped her hand, afraid of her being taken, he kissed her cheek that was not unheard, and which she returned followed by as hard a slap on the cheek of her lover, which she did an hour afterward.

"A pretty kindereen you have got, two helpless women folks!"

"Elsie! Elsie!" said

gelica. "Ye kenen nae dat de kind lad was liken to go out of himself on de day dat he lost tee on de hill; sae hold ty peace, and be tankful for all our mercies."

During this little by-play, which even in the times of the greatest commotion will be played out, Bertram and Clarence were bending over Margaret, who, soon recovering from the shock of this sudden deliverance, opened her eyes, fearfully looking into the face of Bertram, lest all might be a deception. The latter dropped a few warm tears such as a heroic heart will send forth when love returns fond glances as it did here. The kiss of affection was freely given to both brother and lover.

The guilty Clifford sat where he saw the whole. Writhing in his pride and remorse, wounded and defeated, he turned himself away from the sight, gnashing his teeth with rage and pain like what we may suppose Satan to have felt when he saw our first parents in the midst of their happiness.

There was a lull in the tempest, and the late busy actors were enjoying the benefit of the quiet, waiting for the command of some master; no one exactly knew whom, for as yet they had been thrown together as by chance. An underhand movement there must have been, which had succeeded, it is true, but the very skillfulness of the operator had nearly undone the whole. An hour sooner or later would have changed the face of things. The dangerous experiment therefore of allowing the *denouement* to come out in a public display, was was more worthy of a playwright than of a wise man, who never waits for a better chance when he has an almost certain issue. The man who arranged the plot might have delivered these fugitive women a day sooner, but having ulterior views of revenge, he tempted that Providence, who, notwithstanding his rash folly, crowned his scheme with success.

Calderwood, as he was now known to all, was in earnest council with Brandt, whose mind was evidently yielding to what was presented to him. A piece of parchment, such as bears the commission of an officer in the army of Great Britain, was held out to the Mohawk, while the other hand, with earnest gesticulations, was pointing to the several parties within sight, as if he were expounding to the mind of the puzzled Indian some point of difficulty. All at once the face of the red man shot forth a fierce light. He saw that he

had been imposed upon, and coming forward to the place where Margaret sat, still arrayed in her queenly robes, he smiled and looked from her to the eagle that perched above her on the tree. Gazing on the bird, he folded his arms, absorbed in thought; then cast a glance at his own form, which a reader of nature would have interpreted to mean, "We are the true children of the Great Spirit."

"Does the Fawn wish her bird to cross the big water when she goes to the green fields of the great Father George?" This was said evidently with the intention of drawing out something else than a bare answer about the eagle.

"No, Great Chief; the bird shall be set at liberty when I go from here, if my will be law; I love England, and he loves his mountain home. He is screaming for his mate; I have found," she was almost saying—mine; but stopping in the midst of the sentence, she sprang again into the tree, and bidding Elsie look, she loosened the string that bound the legs of Aurelius, stroked his noble neck down with her hand, while he returned her fondness by rising to his full height. Feeling himself at liberty, he rose on his wings, as they spread at their full length. For a moment he hung over the deep lin, then slowly rising, he soared away to his mountain home.

As he ascended, and until he was nearly out of sight, not a word was spoken by any one, when the Mohawk turned on Margaret the look of perfect approbation, saying:

"The Fawn shall be Brandt's sister, for her love to his brother in setting him at liberty; she will wear this, and be one of the Mohawk's wise squaws." With that, as she descended, he put a silver pin in her blanket robe, having a shell attached to it. He moved back to where Calderwood waited for him, and as he passed the place where Clifford sat, he gave him one of those looks of contempt which only an Indian can put on.

"The tongue of the big warrior folds in two," said he. "The Fawn is the kid of the king's Clinton."

By this time the true and the disguised Indians had come in, and were lying all around, waiting the will of their chief. The hunt was past, and had ended so entirely different from the expectations of all, that their minds were in wonder at what should next come up, when suddenly the chief Mohawk started to his feet, and all his tribe

seemed to have risen at the same moment. Their quick ears had discerned their own war-whoop swelling over the hills and the glens, till it reached them. Then came the repeated reports of fire-arms, declaring that a skirmish was taking place not far off, which demanded the presence of the leader. Brandt, without further warning, shouted his war-cry, followed by the united voices of his men around him, till the rocks and the dells sent back the sounds doubled, and redoubled, as if the departed spirits of ten thousand warriors were raised from their slumbers by the call, to repeat the music they loved so well, once more amidst the scenes of former glory.

In a moment Brandt had cut the bark that bound Kiskataam's ankles and wrists; ordering him to his feet, he put him under a guard of his own men, who drove him off before them at full speed. Then pointing Clifford to the westward, he said, or seemed to say, there is now your only chance of escape; the bad man did not hesitate, for though fainting through loss of blood, and suffering from the spiculæ of the bone in the flesh, he was forced into motion; leaving the former companions of his proud days more like a prisoner than a colonel of his Majesty's troops, and the commander of Fort Niagara. He had no alternative but to go, for the looks of scorn and contempt that met him withered his soul; yet still, with the proud step of the soldier, he walked off with the Mohawk.

After the coast was clear, and none were left except the Clintons and their attendants, they looked round on one another, as if a feeling of forsakenness had come over them, and that some one was expected to take the command.

"Where is our captain, Gabriel?" was the cry of more than one. That faithful follower had singled

out, as the special object of his vengeance, the meacaitiff Shandaagan, whose fear had early in the fray got the mastery of his desires. While the attention of the company was engaged by the conflict between the sailor and the chief, the parasite minion slunk away behind the scenes, taking the bed of the stream as his road of retreat. Gabriel, who perceived his motions, and knew him of old, pursued after him in hot haste. The Indian, who knew the path better than the pale face, and who had not endured quite so much fatigue as the other, was soon out of sight, leaving the crest-fallen Sepusonian without a laurel to carry away of this great victory.

"We are about moving," said Bertram, "and we were beginning to fear that the cannibals had eaten you up. 'Better the end of a feast than the beginning of a fight.' You know the glutton's proverb."

"Yes, sir, but not the maxim that rules you judging from the hearty good-will with which you encountered that red rascal. But hark! there is the Dominie and his congregated troops, on the rear of the Mohawk. Gracious heaven, there must be hot work there, if guns speak the truth to-day."

"I am off," said Teunis, "to help the Dominie. He helped me and mine, and Martin Schuyler is one of the captives."

"I will lose an arm in his defence," said Clarence. "Brave soul that he is, with all his oddity."

"And I am with you," said Gabriel. "Let the sailor navigate the ship now. Carry your passengers to port, Elsie will be your pilot; and let us all meet, if we can settle this affair, at the Flat Rock, before sundown."

## THROUGH STORMS, THE HOMES.

BY COUSIN CONSTANCE.

THE blasts of winter show us the homes,  
The tenantless homes, in the leafless trees,  
Drearly swinging, never again  
To shelter a bird with its song of glee.  
From wind-swept bough, and desolate spray,  
To the far bright South they have winged their way.

Summer's green and sheltering leaves  
Screened them all; we only guessed,  
From a waft of music on the breeze,  
That near was a song-bird's place of rest.  
So we, in our dear love-sheltered bowers,  
Sing and dream through the happy hours.

Sudden a blast from sorrow's breath  
Sweeps of verdure our life's green tree,  
Leaving behind the shadow of death,  
Perchance a lifelong misery.  
Bewildered with grief, we lift our eyes  
To the home forgotten beyond the skies.

The blasts of sorrow show us the homes,  
The far bright homes no storm assails;  
The "many mansions," where, one by one,  
The storm-tost voyagers furl their sails,  
And like the birds from our desolate nest,  
We plume our wings for the endless rest.

## THE ETCHIN DIAMONDS.

By F. E. R.

ARTHUR STANGATE, attorney at law, was my brother. He had succeeded to my father's business, and no name was more esteemed and trusted in all Runnington, and Runnington was a rich and important place. My brother's offices were in the town, two miles distant; but he did almost as much business among the gentry at his own private house.

Most of the great folks employed him; but his best client was Sir Etchin Eckford, a *cidevant* Indian judge, very wealthy, and the possessor of some rare and costly jewels, known in the country as the Etchin Diamonds. Their name even makes me shudder now.

One evening, as Arthur was preparing to return to his office, where important business would detain him all night, Sir Etchin's groom left a parcel, with a note. The latter stated that the former contained the famous Etchin diamonds, which their owner thought safest to entrust to Arthur's care, as he had been unexpectedly called to London.

"I don't care what deeds they leave with me," said my brother; "but I don't like such trusts as these. Still, I suppose I must keep them."

Of course, he could not send them back; so, taking the parcel, he at once proceeded to his study to lock it in the iron safe. I went with him, and with a woman's curiosity and love of jewelry, besought a peep at the gems before they were put away.

Arthur, the best brother in the world, instantly removed the paper covering, disclosing a square morocco box, brass-bound, with the key tied to the bundle. Opening it, he showed me the gems. They were, indeed, magnificent, set in the massive Indian fashion; while many of the diamonds were yet uncut. One by one, bracelets, bangles, necklets, Arthur lifted and flashed in the lamplight before my dazzled vision.

He was holding a superb emerald and diamond necklet in his hand, for my admiration, when happening to raise my head, a cry of alarm burst from my lips.

"What is it, Nell?" asked Arthur.

"The man!" I replied. "See! the window is

uncurtained, and I am sure I saw a man looking in from the tree outside."

"Nonsense!" cried Arthur.

Nevertheless, he flung up the window, called, and gazed in every direction. There was nothing—not a sign, not a sound; and assured as I was, that I had been mistaken, he fastened the catch, and dropped the curtain.

As, however, he was about to put away the diamonds, I said, "Arthur, would it not be better to place them in the safe in your bedroom?"

He agreed in the advisability, and locked them up: then, having cautioned me to see well to the house fastenings, and asked again if I was really not frightened to remain alone a night with only the servants Jane and Jenkins, he left for town. I saw everything secure and went early to bed, locking Arthur's bedroom, and taking the key with me.

It was long before I slept. When I did, I was almost immediately aroused by a slight sound at my door. I asked who was there. Jane's voice answered in a cautious whisper. Seeing something was wrong, rising, I admitted her. No sooner had she entered than, quickly closing, she refastened the door, and exclaimed in accents of terror, "Oh, miss! what shall we do? For mercy's sake, make no noise—don't get a light. Burglars are breaking into the house, and I'm sure Jenkins is their accomplice."

"Burglars!" I cried. Then the thought of the face flashed across me. "Gracious powers!" I exclaimed; "they are after the Etchin diamonds!"

I saw it all. The groom's errand had been divined, my brother's absence was known, and, by Jenkins's treacherous aid, the place was being attacked. I dropped, stunned, on the bed. Then I started up. At any cost—even life—the diamonds entrusted to Arthur must be saved. Hurriedly I dressed, and while doing so, heard the soft sound of persons moving in the house.

"Jane," I said, having explained all to the faithful girl, "I must get Sir Etchin's diamonds."

"How, miss? If you go into the passage they'll kill you."

"True; therefore I must get out by the win-

dow. They will not hear, for they believe the box is in the study, and it will take them long to discover their mistake."

Opening the window, I got out on to the veranda. How fearfully it sloped! Could I do it? Yes, by pressing my feet against the gutter. Slowly I went, foot by foot, until I reached Arthur's window. My heart leaped as I found it unfastened. Quickly I entered, opened and relocked the iron safe, and, with the diamonds, more slowly, and with greater difficulty, returned.

Reaching my own room, I did not enter; for what could two helpless women do against strong, evil men, bent on plunder? Instead, I ordered Jane to tear a sheet into shreds, having attached which to the box, I bade her lower it to me, after I had descended by the trellis.

She did as I directed; then joining me, we carrying the box between us, ran from the house.

We had not gone a dozen yards before the dread of pursuit, and having the diamonds wrested from us, possessed me.

"Jane," I said, "this will never do. Let us make for the hollow oak. We can put the box in that; they'll never find it before help comes."

Hastening in the direction together, we managed to raise the box high enough to reach the hole, and I toppled it in. It fell with a heavy thud; I knew it was safe. I then told Jane to run to the Hawthorns, the nearest house, arouse the people, and bring some of the male servants back. She wanted me to go with her, but I dared not leave the neighborhood of the tree, lest any miserable chance should occur of the burglars finding the treasure. Crouching among the bushes some yards off, I bade the girl hasten.

Scarcely had she gone than a noise in the house attracted my attention. My flight with the jewels was discovered. My heart stood still, and the blood in every vein turned cold. With Jenkins, there were three of them. Through the darkness I saw they were beating and searching the bushes. They had guessed we could not carry the box far, and evidently were in hopes of finding it before help came.

Twice, thrice, they approached so near to where I was, that my hair stood on end. The fourth time it was Jenkins himself—I knew him, despite his crape mask—that drew aside the branches, and discovered me.

With a cry I endeavored to fly; but the burglars

instantly secured me. Had the scene that followed; it made me shudder with horror. They looked for the box, not finding it, with awful rage. I told them where it was. My heart leaped aloud, until they checked me by placing a pistol at my head. But I remained firm. I felt they, too, saw it, and by the exquisite torture, are creating, exclaimed, "It won't do to let it go upon us. Gag her, and take her to the lake!"

To the lake! What would become of me! My brain swam, but I remained firm, and save the edge of the water, the rest of the world lay behind my head beneath. My mouth could not cry out, and never felt the terrible sensation. Surely I was dead!

Every few seconds they repeated the whereabouts of the diamonds, shake of the head. How long it lasted, I do not tell; but abruptly a flash of light came to my ears—I felt the water was over me, and I was conscious no more.

The immersion caused a sensation I ever felt in my life. I was unconscious. My breath went away, and I had a painful suffocation, which paralyzed all knowledge of the world. I could not speak for the first time, able to offer the slightest protest.

When I came to I was in the water, and the first thing I saw was near me, and the first words I heard were "My brave Nellie! You have the diamonds. The help Jane brought when the ruffians flung you overboard are all captured!"

It was a considerable time before I recovered from the nervous shock occasioned. One day Arthur came to see me. "See, darling!" he said, holding up a magnificent necklace. "I have put gold on your wrists. Accept this for your bracelet. The Etchin diamonds."

## JEMIMA WILKINSON.

BY JAMES A. ROSE.

As we turn the pages of history and contemplate the record of those who have lived among us and have now passed away, we find one who enacted a long farce, but departed leaving but little in written history to allay that genuine curiosity which is aroused when the name of the famous impostor Jemima Wilkinson is mentioned.

This eccentric person, who was destined to be the founder and leader of a so-called religious sect, was born in the town of Cumberland, State of Rhode Island, in the year 1751. At a very early age she commenced to display some of those characteristics which in after-life made her the leader of a sect embracing many strong-minded people.

Jemima lived in a state of religious indifference until about the twenty-third year of her age; a revival at that time being carried on by the Baptist Society in her native town, she became interested, and from a scorner she soon turned to be one of the most painfully religious of the converts.

She, in fact, spent most of the time of two years until 1776, in reading the Bible and meditating upon religious subjects. The result of such confinement and rigid mental application could result in nothing but reaction; consequently she was prostrated by an illness which baffled all the medical aid at hand. For a long time she lay upon her bed in a state of mind approaching insanity. She pretended at times to see visions from heaven and to hold direct communication with the Almighty.

Her sickness continued until the autumn of the same year. Late one night in the month of October, she seemed to those who watched beside her bed to grow worse. Her respiration ceased entirely; her features became as those of the dead, and to all outward appearances the soul had left the body. Suddenly, when her companions were about to call the family and tell them of the death, the supposed corpse rose up in bed and demanded in a strong and authoritative voice that her clothes be brought to her. When remonstrated with and told how serious might be the consequences of so rash a course, she told them it was no longer Jemima Wilkinson who addressed them, but "The

Universal Friend of Mankind, a name which the mouth of the Lord had spoken." She continued to tell them that Jemima had died, that her body had been reanimated by the spirit of God.

All remonstrance being in vain, she was allowed to rise and dress at midnight. She went about well from that time, to all appearances.

On the next Sabbath following her miraculous recovery Jemima attired herself with more than her usual care and attended the meeting of the Friends as usual, her father being a member of that Society. Many had come to meeting, drawn hither by curiosity; the story of her rising from the dead having rapidly spread through the country. During the service she sat quietly in her seat and seemed to pay marked attention to the speakers. At the close of the morning service, when the congregation left the house to spend the interval between morning and afternoon meeting under the trees in the yard, Jemima went apart from the rest, and, when a large number had gathered about her, rose and addressed them. Being possessed of a fine voice and an excellent memory, she made a deep impression upon many who heard her. Her sermon, or lecture, was filled with Bible quotations, cant phrases and numerous admonitions to her hearers, to "listen to the words of the Lord." She took good care always to speak of herself in the third person. She never actually presented herself as Christ, but her language always was such as to allow of no other interpretation.

Being so much encouraged by this first essay, she appointed meetings to be held at "the house where she tarried;" never calling Jeremiah Wilkinson her father, or in any way admitting a relationship. Many people came to Jemima's meetings. Some came from curiosity, some to make sport, a few from really earnest belief in her divine mission.

Pretending so much as she did, it is not strange that her followers soon demanded some exhibition of her divine powers. Their demands soon became so numerous and pressing that this pretentious woman announced that at a given time she would walk the water. The following account of her

success is narrated in Hudson's "Life of Jemima Wilkinson:"

"She appointed a time at which she would meet her friends on the margin of the Taunton River, in the town of Swansey, and convince them of the reality of what she had taught them to believe, by walking on the water. She made her appearance at the time and place appointed, where she was met by a large collection of people, eager to witness the exhibition which was promised them. She then commenced with an eloquent and fervent prayer, with which she occupied their attention for a considerable time, after which she proceeded to the delivery of a discourse, in which she lectured her audience with considerable ability and with great severity, particularly on account of their want of faith. She told them that if they had faith to believe that she could perform the works of the Lord, they might rest satisfied, for it should be well with them, and as to those who did not believe, they are 'an evil generation; they seek a sign; and there shall no sign be given them but the sign of Jonas, the Prophet.' 'Why doth this generation seek after a sign? Verily I say unto you, there shall no sign be given to this generation.' 'A wicked and adulterous generation seeketh after a sign; and there shall no sign be given it, but the sign of the prophet Jonas.' She continued her discourse at considerable length, admonishing her friends to beware of the doubts and difficulties thrown in their way by a wicked world which was meant by an evil generation. She also reproved those who came there to gratify an idle curiosity, instead of listening to the voice of truth, and was particularly severe upon those who had required this evidence of the truth of her words. She then addressed the whole in kind and affectionate language, proclaimed that she was the 'Universal Friend of Mankind,' and that those who believed in the truth of her doctrines, obeyed her precepts and followed her advice, would be sure of a final passport to heaven, while those who rejected her counsels would be cut off without the hope of pardon or mercy. After hearing her through and receiving her blessings, the assembly separated and peacefully retired to their homes, some filled with awe and fear of her power and authority, some with commiseration at her delusion, and others with contempt at her hypocrisy."

Having succeeded so well in disengaging herself from this predicament, the "Universal Friend"

was emboldened to go still such feats as raising the dead and foretelling human events to her own wit, or some to relieve her of any possible

Having obtained a few villages, Jemima commenced places. Philadelphia at one of her labors. The Meeting-house of George's Church was thrown, she preached to immense numbers of time, making, however, but little progress at variance with the people in Connecticut. She formed converts in South Kingstown, Rhode Island, persons of wealth and high position, from what can be learned from her sources, it seems to have been such under her influence, the dignity of her profession.

In Updike's "History of the Church" is narrated the foundation of these intelligent converts pretended miracles:

"About this time Judge Updike, a zealous and devoted follower of her. For the more comfort of herself and her adherents, he added to his already spacious residence fourteen rooms and bed-rooms. Her influence over her servants, and income of her headquarters for about the scene of some of her miracles. Susannah Potter, daughter of a deceased, she undertook to the day of the funeral, a great witness to the miracle. Then removed, and Jemima knelt in prayer for her restoration, but she was inflexible; the impious she imputed the failure to her followers."

Having by her avaricious manners made herself very rich in Kingstown, the Universal Friend to make arrangements for the Society, issued a decree, commanding their estates and place the fund of the Society. It is

so great was her hold over the Society, that all with one accord obeyed without a murmur, and Judge Potter was the one selected to make this transaction. It is interesting to follow the history of this man in connection with that of Jemima, as he was only one of the many cultured persons who were duped by this remarkable woman.

In 1784 she terminated her arrangements and took her departure to what is now called Yates County, New York; but at that time it was unsettled, except by the Indians of whom Jemima's agent purchased the land. She named her settlement New Jerusalem. Her desire seemed to be, to get as far away from the enlightening influence of civilization as possible, where her power would remain supreme.

What an imposing sight it must have been to see this line of deluded beings, following their eccentric leader away from home and friends into an unknown wilderness!

Judge Potter returned in a few years from his emigration and occupied his homestead, but his circumstances became so embarrassed in consequence of his devotion to this artful woman, that he was soon compelled to mortgage his estate; and finding it impossible to redeem it in its deteriorated condition, he in 1807 sold the remainder of his interest in it, and settled in Genesee."

To-day none of the ancient elegancies of this place remain. The "old abbey," as the residence was called, has passed away. The beautiful gardens, luxurious summer-houses, costly shade trees, and productive fruit-orchards are among the things of the past; a small farmer's cottage, surrounded by the usual farm appointments, take their place.

A wealthy gentleman in Worcester, Pennsylvania, became a follower of Jemima, and, like Judge Potter, sacrificed his wealth in donating to her desires. There seems to be abundant proof that at one time she actually had her hands in the State treasury of Rhode Island. Many anecdotes are related of the manner in which she took possession of a desired object. If some one of her followers possessed an article which their mistress desired, she would enter the house and take the object away, saying, "the Friend hath need of this thing." This was deemed excuse enough, by her followers.

As Jemima grew older she grew more and more severe in disciplining her flock. Her power being absolute and her decrees final, it is interesting to

notice some of the methods of punishing offenders. Many and peculiar were the penances put upon those who hesitatingly obeyed her command.

One person who came under her displeasure was condemned to wear about his neck, in public and private, a sheep's bell, until allowed to take it off. Another was condemned to wear a black cap.

She often gave severe reproof for levity, and sometimes imposed the penance of silence, for longer or shorter periods, according to the magnitude of the sin. In one instance she was destined to have her commands set at defiance. A young woman of the Society who was given to laughter and mirth on the slightest occasion, was directed to keep silence for a number of hours, but something causing her to laugh, she continually broke her penance, until Jemima ordered pieces of cloth to be tied around her mouth. This for a time seemed to be a success, but an extremely ludicrous scene coming to her notice, she burst the bonds, roaring with laughter, and exclaimed: "The Universal Friend is a fool to think she can stop a woman from talking." She then left the Society.

Towards the latter part of her life she prohibited matrimony. This was the reverse of her early teaching, for she had made suitable matches for her sisters, providing husbands from among her Society. This new decree caused much trouble, and some dissension among the believers in Jemima; but she remained firm, and so bent was she in her purpose, that she even caused the separation of those who had been long married. Some wives she induced to leave their homes and follow her, thus sowing discord and unhappiness where contentment had been before.

In New Jerusalem the Friend lived in a state of luxury almost beyond comprehension, when we think of the distance from any large town. Each of the members contributed annually to the support of the Friend, and all turned out to till the fields and harvest the crops that filled the spacious granaries of Jemima.

The Duke of Rochefoucauld, in his travels in the United States of America, 1796 and 1797, met with Jemima Wilkinson in the State of New York. The Duke was struck with the extreme neatness and elegant luxury of Jemima's residence. She always seemed flattered by the attention of learned or wealthy people, so the Duke gained access, and by his letters, seems to have travelled over the

greater part of her mansion. His description of the Friend, although harmonizing with that given by others, seems to be so much more complete, that I can do no better than to insert it:

"We saw Jemima and attended her meetings, which were held in her own house. We found there about thirty persons, men, women and children. Jemima stood at the door of the bed-chamber, on a carpet with a chair behind her; she had on a white morning-gown and waistcoat, such as men wear, and a petticoat of the same color. Her black hair was cut short, carefully combed, and divided behind into three ringlets; she wore a stock and white silk cravat, which was tied about her neck with affected negligence. In point of delivery, she preached with more ease than any other Quaker I have yet heard; but the subject matter of her discourse was one eternal repetition of the same topics—death, sin and repentance. She is said to be about forty years of age, but she did not appear to be more than thirty. She is of middle stature, well made, of a florid countenance, and has fine teeth and beautiful eyes." The Duke was impressed more than anything else with her "bad acting," and seems to think all persons must have been weak to have seen anything remarkable about her. He described the dinner, of which he was invited to partake, as being the nicest he had eaten outside of Philadelphia, and praises a drink which Jemima concocted in her own room and sent to the table. The Friend did not eat with her guests, but came to the table and conversed with them after partaking of a sumptuous repast in private.

Thus the Universal Friend lived and ruled supreme in her colony until about two o'clock in the morning of Thursday, the first day of July, 1819. Having been in failing health for some time previous to her death, her summons was not unexpected; but so firm in the belief of their mistress's infallibility were some of her followers, that they stubbornly refused for some time to believe that she was no more.

Jemima's remains were placed in a coffin, and a pane of glass was inserted in the lid, that her face might be seen by her followers; no others were allowed to approach her. After a day or two of lamentation the body was removed to some secret place by her two or three trusted female companions, and no one beside these few ever knew her final resting-place. Many of her followers

believed that she rose on the death, and being encouraged those having the body in charge were able to leave the world lived, with an air of mystery memory.

In the course of Jemima's considerable property, and before her death was in consequence. She appeared before the court as plaintiff or defendant in many cases, and was involved, and as a general court victorious. It would be difficult to say of her character would disprove divinity; but it seems to have been upon her followers.

About a year before Jemima's death, leaving her large and valuable property, including household furniture, etc. to her daughter, Margaret Malin. These women were from the outset of her career her most secret counsels, and instances of great service to her. Of the Friend's body after her death were the persons who secreted her in the cellar of their mistress's house, and a peculiarly expressed instruction to the Universal Friend."

Several months after the death of Jemima she thought best to add the

"Be it remembered, That I, the said Jemima Wilkinson, do hereby certify that the doubts of the due execution of the said will and Testament being the year one thousand seven hundred and seven was known and called Jemima Wilkinson, but as the said Jemima Wilkinson, do make the within instrument as my own—do witness my hand and seal the twentieth day of the seventh month of the year one thousand eight hundred and

This was done, no doubt the Probate Court would not refuse to write her true name, in measure evading an acknow-

The following letter of Jemima is inserted to show the nature of her epistolary correspondence. It seems to harmonize with the accounts of her conversations. It is inserted just as it is written, as regards orthography, punctuation, etc. :

"WORCESTER (Penna) 20th of the 9th Month 1789. The Universal Friend, To John Rose and his wife remembers Love: Dear Souls, Try to to make your escape from the wrath which is to come, upon all the wicked, that no not God; & have not and and have not obeyed the voice of the dear Son of His Love; It is a Sifting time; Try to be on the Lord's side; Do justly love Mercy, and walk humbly with the Lord: The Friend is yet in time; & Sarah; but She is Sick. Do all of you try to obey the Counsel of the Lord which ye have heard from time, to time: That it may be well unto you: Do by all as you would be willing to be done unto: Orpha be, Be faithful; I remain to be the same Friend; I have not altered or Changed. I remember Love to Elizabeth Carr. To E: J: To H: F: To E. B: To M: M: To M: F. & to the Children. From the Universal Friend. Sarah Friend, R. Millen, Ruth & Lucy Brown remember love to you all. Watch & pray that ye enter not into temptation. Saith the Friend to J. R. & Orpha. I remember Love to Eunice Hathaway.

"U. F."

This letter, written in a bold, firm hand, was selected by the writer of this article from a number of her letters, it being a fair specimen of them all.

A great many persons have written about this notorious woman, both before and since her death, showing what a hold she took upon the minds of men. Besides the writers cited in this article, Hannah Adams, in her "View of Religion," published in 1801, devotes a chapter to Jemima. "Marshall's Catechism," 1802, and "Eccentric Biography, or Memoirs of Remarkable Female Characters, Ancient and Modern," published in 1804, are among the best known. At different times since her death newspaper articles have appeared; but have added little to her history.

The one point at which people who have studied her character are at variance upon is, whether she was a hypocrite, or whether she was suffering all these years from mental delusion. At this time, when her mortal remains have long mingled with the dust, and when her Society has, like herself, long been numbered among the things that were, we can only take the few *facts* that we have, and draw our own conclusions. We can throw the mantle of charity over those places where it would seem that we must judge harshly, well knowing that whatever individual result we may arrive at, it will have but little effect upon the memory of Jemima Wilkinson.

## CROWNS AND CROWNED.

THERE were times when his crown was the indispensable companion of every king. Not that he always wore it, like the monarchs of melodrama, but it was his personal property, always kept within easy reach. He carried it with him on his journeys; when he rode at the head of his feudal chivalry on the battle-field, a jewelled coronet on his helmet took its place; he wore it at his court; it was the one great mark of his royal dignity by which men could feel he was a king. It would seem that some of these old sovereigns slept with the crown upon a table beside their beds; there is, however, no reason to suppose that they actually wore it during the hours of repose, though they are often represented as doing so by the illuminators of medieval manuscripts. Of course, this is

only a conventional sign indicating that the sleeper is a king, for assuredly the head would lie *very* uneasily that wore a crown for a night-cap.

The oldest of the crowns of Europe is the Iron Crown of Lombardy, now restored to its resting-place of centuries in the cathedral of Monza, the sunny little town, which, from the Alpine slopes, looks down upon imperial Milan, whither many a time its treasure was borne to be placed on the brows of a German Kaiser at his second coronation. His first was at Aachen, by the tomb of Charlemagne, where he received the silver crown of Germany; his second at Milan; his third at Rome, where the Pope conferred on him the golden crown of the Empire. But the Iron Crown was the most venerable of all. For thirteen

hundred years the Iron Crown has held the foremost place amongst the diadems of Europe, for it was formed by the skillful hands of Roman goldsmiths in the sixth century, and sent by Pope Gregory the Great to the Gothic Queen Theodolinda, when she had freed Lombardy from the Arian heresy. Its form is simple, as one might expect from its ancient date. It is a broad flat ring or diadem of gold, adorned with enamelled flowers and precious stones; stones not cut into facets, as in modern jewelry, but emeralds, sapphires, and rubies in their rough uncut form as they came from the mine. But inside this circle of gold and jewels is a thin band of iron, from which the crown takes its name, and this iron, tradition asserts, is one of the nails of the true cross hammered out into a ring. Long and angry have been the battles fought by antiquaries on this point. Those who deny its authenticity, headed by Muratori, certainly bring weighty arguments to the support of their view; but the tradition has survived all their learned folios, gallant champions have fought, pen in hand, in its defence, and still in the language of the people the crown of Monza is called *il sacro chiodo*, "the holy nail." It graced the imperial front of Charlemagne and a long succession of German emperors, ending with Charles V. But the last sovereign who wore it was Napoleon I. In May, 1805, he assembled at Milan the dignitaries of the Empire, the representatives of his royal and imperial allies, and a splendid circle of marshals and generals, and in their presence he placed it on his head, repeating the proud motto of the Iron Crown: "God has given it to me; woe to him who touches it!" In 1859, the Austrians, retreating from Lombardy, took the Iron Crown with them to Mantua, and subsequently to Vienna. There it remained until, by the treaty which ceded Venetia to Italy in 1866, it was restored to its old home in the sacristy of the cathedral at Monza, and there it rests to-day amid the other treasures of Theodolinda—her jewelled comb, her golden hen and seven chickens (the symbols of Lombardy and its seven provinces), and the crown of her husband Agilulph.

Next in age to the Iron Crown, but far exceeding it in value and beauty of workmanship, are the crowns of the old Gothic Kings of Spain, discovered seventeen years ago near Toledo. They were found in some excavations which were made in an ancient cemetery at Fuente di Guerrazar, two

leagues from that city. They are eight in number, and their intrinsic value is estimated at two thousand pounds. The largest, a splendid circle of gold one foot in diameter, bears the name of King Receswinthus, who reigned in the middle of the seventh century. This diadem is adorned with fine rubies, pearls, and sapphires, and round it runs a row of little crosses of carnelian and gold. From these crosses letters of gold and carnelian are suspended by golden chains, and these form the words *Recesvinthus Rex Offeret*—"King Receswinthus offers (this)." From these again hang twenty-four drops of gold and pearls, and below these are twenty-four pink rubies, each cut into the shape of a heart, so that a gorgeous fringe of golden chain-work and jewels adorns the crown, and a large jewelled cross is suspended from it in front. The second crown, supposed to be that of his queen, is not so rich as the first, but it too is adorned with precious stones and fringed with rubies. The other crowns are of a very plain pattern, and are supposed to be the coronets of Gothic nobles. The inscription on the crown of Receswinthus shows that it was offered to a church, for it was not an uncommon thing for kings in the Middle Ages to hang their crowns above the altars of some famous sanctuary. Thus Canute gave his crown to Winchester Cathedral, and many of the cathedrals of the continent either have, or formerly had, royal crowns in their treasuries. On one of the smaller coronets there is an inscription indicating the church which possessed these splendid crowns. The inscription is in barbarous Latin, and it may be translated: "In the name of the Lord, Sonnica offers this to Santa Maria di Abaxo." Now, a church of that name stands at the foot of the hill on which Toledo is built, full two leagues from the cemetery. How, then, did the crowns make their way to it? Not by theft, or they would not have remained there long. Probably, when, fifty years after the reign of Receswinthus, the Moors came pouring into the valley of the Tagus and took Toledo, some Gothic priest or noble removed the crowns from the church to save them from the plundering infidels, and, unable to take them with him in his flight, buried them in the cemetery of Fuente, hoping, doubtless, to come back for them at no distant day. But years on years passed before the Christians returned to victory from the Asturian hills, and then no one knew where the rich treasure was concealed, and there it lay for

eleven hundred years, until in our own days an accident brought the buried crowns to light, and the bright jewels which had passed long centuries in darkness, once more flashed in the sun.

Another ancient crown now in the regalia of the Austro-Hungarian empire, has a singular history. It is the famous "Sacred Crown of Hungary." Tradition says that it was formed by the hands of angels for the sainted King Stephen; but history gives us the true story of its twofold origin, for the crown is partly Roman, partly Byzantine, and is, in fact, two crowns united, one above the other. The first was sent by Pope Sylvester II. to Stephen when he was crowned in 1001. It was a golden diadem, enriched with pearls and precious stones. Seventy years later, Duke Geyza, one of the Hungarian nobles, received as a present from Michael Ducas, Emperor of the East, a splendid Byzantine crown; and when he became King of Hungary, he joined this circlet to the diadem, so as to make of the two a single crown. From the broad jewelled ring which forms its base spring four arches of gold. At the base of each is an enamelled portrait; the largest represents our Saviour; the others, Geyza himself, and the Emperors Ducas and Constantius Porphyrogenitus. Four smaller enamels on the front of the crown represent the archangels Michael and Gabriel, and saints George and Demetrius. Besides the pearls, the stones which adorn it are sapphires, amethysts, and rubies, many of them rough and uncut, like those of the crown of Monza. At the back is a very large sapphire, surrounded by four green stones, on the precise character of which jewellers are not agreed.

This crown was regarded as the palladium of the Hungarian nation. It was more than a mere mark of sovereignty. They seemed to look upon it with a superstitious awe, as almost a living thing. It had its palace in the castles of Ofen or Vizegrad; the two nobles who were responsible for its safe keeping were among the highest officials of the kingdom; and under their orders they had a strong guard of picked men, who garrisoned the palace honored by the residence of the Sacred Crown. No king could rule until it had been placed on his brow; if he died between his election and coronation, his name was struck off the roll of kings; and even a pretender acquired a quasi-right of sovereignty if he could, by fraud or force, secure possession of this double crown. In 1301 there was

a disputed election to the vacant throne. The rival claimants were Robert of Anjou and Naples, and Prince Wenzel the Younger of Bohemia. War raged between the rival parties, and the prince had suffered some defeats, when his father Wenzel, King of Bohemia, came to his aid. Marching into Hungary, he occupied Ofen, seized the Sacred Crown, and taking it with him, returned to Prague, accompanied by his son. The Hungarians then gave up both claimants, and elected Otho of Bavaria; and, by some means which history does not record, most probably by paying down a good round sum of money, Otho succeeded in inducing old Wenzel to give him up the crown, without which his election would have been of little use to him.

In order to reach his new kingdom, he had to pass through the territories of Austria. Now ensues a series of strange incidents scarcely credible regarding the crown, which was for a time contended for by rival kings, and at length lost. At last, being found, Joseph II. brought it to Vienna, but it was soon sent back to Hungary. During the revolution of 1848, it was in the hands of the Provisional Government, and on the defeat and flight of Kossuth, it mysteriously disappeared. Some said it had been brought to London, others that Kossuth had broken it up and sold its jewels in Turkey. Neither report was true. A few months after, a peasant offered for a sum of money to restore the missing crown, and pointed out a tree, amongst the roots of which Kossuth and his friends had buried it, in order to deprive the Austrians of this symbol of sovereignty. It was solemnly restored to the castle of Ofen. "It is only now," said an Austrian statesman, "that we are really reigning again in Hungary." Only a few years ago the crown was brought from its castle under happier auspices, to be placed on the brows of Francis Joseph, as a symbol of the reconciliation between two great nations, when, after the crushing blow of Sadowa, Austria yielded all the claims of Hungary.

The ancient crown of Scotland, now in the castle of Edinburgh, has had adventures not unlike some of those of the Hungarian diadem. It is supposed to have been made for King Robert Bruce, and is formed of two circles of gold, the upper one being surmounted by a row of crosses and fleurs-de-lis, while the lower and broader ring is adorned with precious stones in their rough unpolished state.

From this rise two arches of gold, which unite in a ball and cross. Even when the Stuarts became kings of England, they came to Scotland, after their English coronation, to receive this crown at Scone. Charles I. indeed wished to have the crown and regalia of Scotland sent up to London, in order that the ceremony might take place there, but this was regarded as an infringement of the rights of the Kingdom, and he had to come to Scotland, where he was crowned, June 18, 1633.

When, after his father's death, Charles II. asserted his rights in Scotland, he was crowned at Scone on January 1, 1651. On Cromwell's advancing across the Border, the crown and regalia were sent away from Edinburgh to the strong castle of Dunnottar, on the shores of the North Sea, lest they should fall into his hands. They were placed under the protection of a picked garrison, commanded by the Earl Marischal and Ogilvy of Barras, a veteran soldier. Several guns were sent to reinforce the castle, among others Mons Meg, and the great embrasure through which this monster was fired is still shown at Dunnottar. On the 3d of January, 1652, the Cromwellian General, Lambert, having closely invested the castle, summoned it to surrender. This summons was rejected, and the siege began. Ogilvy had previously asked that a ship might be sent to carry off the crown, sceptre, and sword of state; but Charles had not been able to comply with his request. It soon became evident that the castle could not hold out long, and it was therefore necessary to devise some plan for saving the regalia. The chief agent in the plot was the wife of the Rev. James Granger, of Kinneff, a small church four miles from Dunnottar. She obtained from General Lambert permission to pass through his lines, in order to visit the lady of the castle, and on her return secretly brought away the Scottish crown. Her maid followed her, bearing two long bundles of lint, as if for spinning, but in one of them the sword of state was hidden, and in the other the sceptre. On reaching Kinneff, she gave them to her husband, and that night they went into the church, raised a flag of the pavement in front of the pulpit, dug a hole, and buried there the crown and sceptre. In another part of the church they hid the sword in the same way. When, on the fall of the castle, the regalia were found to be gone, great was Lambert's indignation. Tradition says that he suspected the Grangers, and tortured them in vain in order to extort their

secret. But suspicion was at first directed by the report that the crown had been taken away by the minister. Occasionally, the minister a night into the church to change the crown was wrapped, in order to keep it from the damp; and at the fall of the crown up the regalia in safety to Charles II. for two thousand marks reward for her faithful service. After the death of Charles II. on account of the strength of the English government very many occasions the minister regarded the sentiment of Scotland for the crown and regalia, as its most precious treasure were shut up in a strong coffin in the vault of Edinburgh Castle. This was the case until they were again restored to the king after the mission appointed for that purpose.

Of the modern crowns of Europe, perhaps the most remarkable is the triple crown or papal tiara, called also say tiaras, for there are four of them. It is seldom worn by the Pope in procession, but, except on solemn occasions, he wears a mitre like an ordinary bishop. The existing tiaras, the most beautiful is the one given by Napoleon I. to the Pope in 1804. It is said to be worth upwards of five hundred pounds. Its three circlets are set with sapphires, emeralds, rubies, and diamonds; and the great emerald in the center is the most beautiful in the world, valued at sixteen thousand francs.

Napoleon had another magnificent crown made for himself in 1804. It was proudly placed upon his head in the cathedral of Notre-Dame de Paris. The circle, from which spring the rays, is mounted by the globe and arches join the circle there are twelve and miniature eagles of gold. It remained in the French Museum until it was assumed by another Bonaparte. Napoleon III. made himself Emperor in 1854, and the regalia of France, which had been brought back to Paris from the British Museum which they were sent for security during the Russian invasion, just as the Scots were sent to Dunnottar. If we may judge from the German photographs of the Emperor

crown of the new German Empire is of a very peculiar shape, apparently copied from the old Carolingian diadem. It is not a circle, but a polygon, being formed of flat jewelled plates of gold united by the edges, and having above them two arches, supporting the usual globe and cross.

There are several antique crowns in the churches of the Continent. One of the most interesting is that in the treasury of the cathedral of Aix-la-Chapelle, which is an offering sent there by Mary, Queen of Scots. It is a gold circlet adorned with jewels and pearls. A still older crown is preserved in the great church of Namur. It is that of the

Crusader king, Baldwin of Jerusalem. It consists of a jewelled diadem of gold, ornamented with leaves and trefoil, and in two of these ornaments are thorns said to have been taken from the crown of our Saviour. The tradition recalls the words of another king of Jerusalem, the chivalrous Godfrey de Bouillon. When, after the taking of Jerusalem, the Crusaders made him king, and offered him a crown, he is said to have put it aside, saying: "I will never wear a crown of gold in this city, where my God once wore a crown of thorns;" a reply worthy of Tasso's hero, the deliverer of the Holy Sepulchre.

## RIPPLES FROM THE RHONE.

BY FRED. MYRON COLBY.

### IN TWO PARTS.—PART I.

THE RHONE has not the great name which marks the Rhine. No poet has sung its praises; no legends are in the hand-book. The superstitious creations and fantastic shapes of water-sprites, gnomes, and Black Huntsmen, have never revelled among its waves nor haunted its olive groves and sunny vineyards. Neither does the traveller seem to fancy the most rapid of the great European streams. The few who make its acquaintance usually do so with knapsack on back and steel-pointed baton in hand, when they stand upon the mother glacier and watch the river child glide brightly into air; or perhaps it is near fair Geneva that, loitering on a stone bridge, they mark the second start in life of the strong river, and philosophize, if they are addicted to the habit, regarding the corruption which fouls the pellucid waters of the snow from their partnership with those of the clamorous and uncleanly Arne. If they ever descend the stream it is with no thought, no perception of its beauties. They regard it only as a mere beast of burden. They are bound south, and they know that the "swift, arrowy Rhone" will add wings to the speed of steam; that stepping on board the long, low steamboat from the noble quays of Lyons at summer's dawn, they will step ashore amid the uproarious Avignon porters by the summer's eve. All else is a blank—the flight past rocks and vines and carnlands, by old Roman

towers, villages and cities, where medieval architecture mingles with the modern, and under bridges of stone whose arches may have been laid by one of the Cæsars, and which may have bristled with the lances of proud old Raymond's warriors in the brave Crusading days—all this is unnoticed. Why is this partiality exhibited? Why should the Rhine, with its castled rocks, its Mayence, its Coblenz, and its Cologne, its memories of Cæsar, Charlemagne and Napoleon, be the delight of tourists who scarcely deign to look upon the Rhone, equally as famous for its historical lore? We answer: It may be fancy; it may be the secret charm of fable which has invested the northern stream with memories of mermaids and Oreads to the exclusion of the other, or it may be the tyranny of Fashion. Really we incline to the latter. For the moment let us put the two streams in juxtaposition so that we may the more readily compare their respective charms and beauties, and arrive at a just conception of the same.

The two rivers have their sources in the same Alpine mountains. One Rhine spring rises to the north of the Pennine Alps, no more than twenty miles from the cold fountain cradle of its southern sister, the Rhone. The same rain and melted snow feed them, but each stream follows the course it has traced. The one flows towards the north, traversing the vast forests of the Germanic tribes,

ancestors of the Angles, the Saxons, and the Franks; cold, cloudy, industrious, resolute, are the countries it waters, fit types of the majestic stream which gives them life. The other flows to the south towards the sunrise; it crosses all the towns where the Greeks and Romans successively planted the germs of civilization, the traditions of their genius, and those melodious languages immortalized by the noblest poets and the greatest authors that ever honored humanity. The Rhine, stately and calm, glides on its way to that northern sea through countries richly illustrated by history, legend, and romantic minstrelsy, as well as the evidences of modern industry. Over its vine-covered borders and dead volcanoes hover the shadows of three mighty men—Cæsar, Charlemagne, Napoleon. What memories are hers—of Romans marching and countermarching, and building camps, towers and towns on its banks and gorges; of their victories and reverses; of the feudal ages when "banners waved on high and battles passed below;" when mighty strongholds rose up as if by magic, the homes of knightly robbers who levied toll on travellers and burghers, till the latter put iron pots on their heads and came to drag them down; of great movements of emperors and kings, generals and ecclesiastical councils, and all the long fierce argument—not yet ended—between the French and Germans—the men of Frankenland and the men of Hessenland.

The Rhone, by turns a rivulet and a torrent, now flows, now precipitates itself through a land filled with poesy which has never been sung, beneath a blue sky, towards an azure lake—that glorious midland sea, which from the beginning of history has seen developed on its banks all the destinies of mankind, and where perhaps some day will be decided the future fate of humanity. Between sunrise and sunset its waters sweep from the land where the chestnut and the walnut abounds, through the zone where the mulberry is almost exclusively the tree; next past the region where men are clipping and twisting and trimming the olive, at once sacred and classic, and, finally, fairly into the flats, where tropical rice grows out of the fever-haunted swamps and Hindoo-like jungles of the Carnague, thus accomplishing in a day a run of one hundred and ninety leagues from a climate which may be described as temperate, to one which is to all intents and purposes torrid.

Mars and Minerva have in the Rhone as well as on the earliest age it has been a his all its annals of war and blood in the beginning of the of before the tales of the great France were in vogue, grim the Albigenses and Count R and in later days dealing v Ivry put an end to, but which the peasants of the wild hill their white *camisas*, Largue which the name of Camisa over their clothes as uniform and obstinate contest of the quently beat even the great de Villars, with the best of Grand Monarque, there is horizon the great name of H Carthaginian worthy was on tary heroes that the world he was no less great as a peace than at the head of estimate of his character is much more candid and corre contradicts the charge of cr brought against him, and of ness not a single instance is and statesman his name r those of Cæsar and Napoleon compared with him. With nibal would have conquered was more than a great gener man. He was an ardent j Bruce, Gustavus Vasa, Touiss not more gifted with the spi was also a man of cultivated learning and progress and t Like his father, the great seems to have possessed too sonal attractions which enal control all those who were u difficulty. That he was be detract from his glory. H though he had conquered t and turned the tables on old, and it was better for the wo triumph.

There was no grander e either in ancient or modern march from Saguntum to the

this had been a retreat from a victorious enemy such courage and endurance would have been praiseworthy. Julian retreating across the desert, Napoleon fleeing from Moscow, and Suwarrow over the Alps, are wonderful events in the annals of war. But Hannibal was marching after an enemy instead of fleeing before one; he was leaving home and safety behind to attack the enemy in his own country, and thus to encounter perils and hardships voluntarily was certainly an act which has no parallel in human history. It is a striking proof of the capacity, the hardihood, the daring energy, and the skill and firmness of that man whose genius well-nigh wrought Rome's ruin, and who, in all her history of a thousand years, was the most terrible enemy she ever encountered.

Let us go back for a brief time to that pleasant month of June two hundred and seventeen years before Christ, and watch Hannibal on the banks of the Rhone. Hannibal was a swarthy young Moor or Saracen, of the same blood with the Arabs. His people, enterprising and commercial, had sailed with their galleys into every part of the Mediterranean. They had conquered a home in Southern Spain, and the towers and ramparts of Carthage dimly foreshadowed the splendor and beauty of the Moorish Alhambra. Rome, their powerful rival, regarded with envious eyes their many conquests, and the fiat had gone forth from the Roman senate that no hostile array should pass the Rhone.

With an army of fifty thousand foot, nine thousand horse, and thirty elephants, Hannibal, however, now stood looking across the deep, broad, wild rushing river to those distant snow-clad hills, beyond which was Italy. The great river must have been honored at the splendid spectacle which flashed for the first time along its banks and was reflected in its waters. Barbaric, half-clad tribes, with now and then a wandering Greek or Phœnician vessel, had before been the only visitors to its banks. Now all the warlike pageantry of a powerful civilized nation was gathered there. War elephants glittering with the rich paraphernalia of Oriental taste; squadrons of Numidian cavalry, horses and warriors clad in gay trappings; slingers from Sicily and the Balearic Isles, dressed in short tunics and crimson caps, and the heavy infantry of Spain armed with shields, helmets and breastplates of brass, carrying short swords and spears; all these had been arrayed by the great leader for

his adventurous enterprise. Over all shone the ensigns, indicia of the different tribes, here a star, there a crescent or a shining sphere; but most usually a floating cloth emblazoned with the colors of Carthage—the red and the blue. And most splendidly decorated of all, riding at the head of his chiefs, was Hannibal, his vestments richly embroidered, his air that of a king, lithe, active, handsome, his eye and his mind busily scheming how best he could overcome the overwhelming opposition of that rapid, sullen stream—a barrier more formidable than the Alps or the legions of Rome. What a picture it was!

Hannibal's genius triumphed over the Rhone, as it triumphed over everything else save Roman energy. In three days he carried his glittering brigades across the rushing current. Various accounts tell us how he accomplished the feat. The old historians grow eloquent as they relate how the horses, mad with the terror of fire, swam wildly across the stream, and how the elephant roared upon the rafts. Hannibal made this wonderful passage somewhere in the neighborhood of Roquemaure, at Pont St. Esprit. From this point he marched up the river nearly a hundred miles. Near where the Isère empties into the Rhone he formed an alliance with the chieftain of the Allobroges, who furnished him guides across the Alps. This was the last that the Rhone ever saw of Hannibal, and when after fifteen years of alternate triumph and defeat the Carthaginian hero stood gazing at the fading towers of Capua and the distant blue of the Campanian hills beyond, from which his war-ship was conveying him, the Roman eagles held the Rhone stream in jurisdiction.

Politically the Rhone is not so important as the Rhine. The latter stream has been from the earliest period closely interwoven with the fate of empires. A boundary for the empire of Cæsar for four hundred years, it has since then seemed to insure the supremacy of the power to which it belongs. With the loss of the Rhine Rome began to decline. The most formidable captains of Europe have led their armies across the Rhine, and become powerful in the possession of its water-course. It was from the Rhine that the Franks under Clovis descended to the conquest of Gaul and at the same time laid the foundation of the modern glory and civilization of the French people. Charlemagne made the Rhine the centre of his empire. The house of Lorraine grew strong in its

possession, and Louis XIV. derived his greatness and triumphed over his enemies by means of the power it gave him. To-day the house of Hohenzollern has no surer lease of power than is derived from the possession of the banks of the Rhine. To this one fact Prussia is indebted for her supremacy in Germany. Such is the Rhine; the stream of the warrior and the statesman, a river set for the rise and fall of kingdoms.

But let us look at the Rhone, a river which for its beautiful scenery, its commercial affiliations, and its pageantry of associations, so to speak, is not rivalled even by the Rhinus superbus—the river of the Fatherland. On the banks of this black, fierce, foaming current are striking points of scenery; nooks, and ravines, and old towers; vineyards covering the sides of the hills where the luscious grape grows ruddy by the hot kiss of the sun, and broad pasture lands that remind one of the Lombard plains around Milan. Great cities crowd the stream: Lyons, Valence, Avignon, Arles, Geneva; cities which have marked eras in the history of the world. Down its valley passes the commerce of France, the silks and the jewelry of Lyons, the watches and wool of the Swiss cantons, the wines and the olive oil of Burgundy and Languedoc, and the fruits of Provence. Beauty, chivalry, and heroism, too, have breathed a thousand charms upon the stream, and its shores are classic ground. At each end of the winding wonder liberty has long held her most cherished abodes; one among the high plateaux of Switzerland, whose people have ever been the worst foes of tyrants, the other in the rich plains of Languedoc, the home of the valiant Albigenes and the heroic Camisards.

The Rhone enters the Lake of Geneva a dark muddy stream; it leaves it perfectly pellucid and of the finest azure hue. Its waters are soon discolored, however, by the current of the Arne. Later it is still more fatally fouled by the sluggish Saone, which flows down by Lyons, heavy and fat with the rich mud of Burgundy. In its whole course it is a black, unmerciful looking stream. Its very aspect suggests the fate of Hylas, though no poet could ever imagine its waters being haunted by mermaids.

It is at Lyons where the traveller begins to see the Rhone in its grandeur. Immediately upon the affluence of the Saone the river assumes a breadth and a depth commensurate with the commercial reputation that it bears. From this place

till its waters join the sea, a distance of two hundred and forty miles, the Rhone is a great river, constantly increasing in volume by the accession of the Doux, Ardèche, Cèze, and Gard, from the Cevennes on the right, and of the Isère, the Drome, the Vigne and the Durance from the Alps on the left. It enters the Gulf of Lyons by two mouths—each a mighty estuary a mile wide. Despite its rapid current, its sudden floods and its shingle banks, the Rhone was always navigable. See, toiling up the stream is a Greek galley or quireme, with four benches of oars. Slowly the rowers struggle against the tide, but up they go for a hundred miles, when they draw to land. Bales of merchandize are unloaded and carried out upon the shore. Bands of natives approach from the surrounding forests, bringing ore, and furs, and fruits. In a short time a bargain is consummated, the galley is reloaded, and the sailors embark and row down the stream. The ship is a trading vessel from the Phœcean city of Marsillia, now Marseilles, whose enterprising people include the Rhone among their commercial routes. The scene changes. Hannibal has passed with his glittering legions three hundred years or more, and war ships and pleasure galleys go rowing up the tide. Banners and devices float from the masts, paramount among which is the eagle, conquering symbol of Rome. Still later by fifteen hundred years and another sight meets the vision. An *equipage* goes crawling along under the purple skies, in the golden air of soft, voluptuous Southern France; an *equipage* consisting of half a dozen huge barges drawn by twice as many more struggling, panting horses upon the bank. Before the invention of the steam-engine there were fifty of these barge squadrons in use upon the Rhone. The passage down the river from Lyons to the port of Beaucaire, opposite Arles, generally occupied three days; but tedious and protracted was the voyage back. A month sometimes was consumed in the dreary struggle with the obstinate, ever-opposing current. The introduction of steam has destroyed forever the utility of *equipages*, and the great steamers that now fly along the river's bank have reduced the cost and toil of transportation to a minimum.

Lyons, a city of three hundred and twenty-five thousand inhabitants, is not unworthy of mention. The ancient Lugdunum, Lyons, was a great place under the Romans. A colony first settled there

as early as the year 43 B.C. Under Augustus it became the capital of the province. It was the centre of the four great Roman roads which traversed Gaul, the seat of a college, an athæneum, and a senate. Claudius, who was born there, gave Lugdunum the privileges of a Roman city. Under the Franks it was a first-class city. Childebert and his queen resided here in the sixth century. The Hôtel Dieu was founded by these sovereigns, and is about the only memorial left of their greatness. Lyons is the first of European manufacturing cities; she sits as a queen and has no rival. Her jewellers and goldsmiths transact a large business; woolen shawls are produced to the annual amount of two million four hundred thousand dollars, and carriages, glass, machinery, leather, and soft-soap are manufactured to some extent. All these branches of industry, however, are overshadowed by the silk manufactures. They were introduced into Lyons in the reign of Louis XI., by some Italian merchants, and now for two hundred and fifty years have been the great source of its trade and industry. At the present time it employs some sixty-five thousand looms, and provides employment for one hundred and ten thousand persons. The total annual value of silk manufactured in the arrondissement of Lyons is estimated at forty million dollars.

Lyons has some fine architecture. The City Hall and the *Palais des beaux Arts* are the two principal public buildings. The latter consists of four large piles of buildings devoted to the several arts and sciences, and contains a public library which is the largest, out of Paris, in France. The City Hall is one of the finest structures of its kind in Europe. The Cathedral of St. John is a fine specimen of the Gothic. Many old edifices whose foundations go back to the early days of Frankish monarchy, are found in various parts of the city. The site of the ancient palace of the Roman Emperor is occupied by the Hospital of Antiquailles, devoted to lunatic and incurable diseases. Lyons is the seat of an archbishop, and is the headquarters of the eighth military division.

Steaming down from Lyons towards Vienne, the traveller, if he wishes to, notes magnificent scenery. He in fact commences the enjoyment for which the stranger has journeyed so far—the aspects of the Rhone set beautifully off by its natural and historic surroundings. The masonry of Rome stands by the stream, and ancient rock-perched

ruins are there reminders of the grim old feudal ages. Waving along the sky on the river's right bank is the picturesque line of the Cevannes, beautiful and bright in the sunlight, grand and solemn in the shadow. Bacchus loves the country through which we are passing. The banks of the Rhone below Lyons is as famous for its vintage as any of the Rhinelands. Every declivity is clothed with vines. Wherever a prominence can catch the sun rays the peasants have planted the grape, and it grows here as it grows nowhere else. Anacreon might have sung still sweeter Bacchiodes if his lips had quafied the wine pressed from these luscious grapes, rather than the cold Greek beverages, and Sardanapalus himself, or the most exquisitely fastidious Sybarite or Pompeian lived in vain, despite the farmer's well-known apothegm, "eat, drink, and be merry; the rest's not worth a fillip," for how could they be merry seeing they had never tasted of the Hermitage or the unequalled Languedoc?

Vienne, on the left bank, is an old and strongly fortified place. Here was the home of the famous Count Vienne, who gallantly defended Calais against Edward III., in those bloody wars of the Plantagenet and Valois princes. Here is the knight's tomb where his ashes lie, leagues and leagues away from the old seaside town with which his name is indissolubly connected. Vienne was the capital of the first and second kingdoms of Burgundy which existed in the fifth and sixth centuries. It was a very important place in the Middle Ages. The fifteenth ecumenical council, under Pope Clement V., and which abolished the order of Knight Templars, was held here in 1311.

We sail on down the river. Soon the stream contracts, the boat sweeps toward a rocky promontory. From the opposite shore another bold cliff intrudes into the current, and the narrowed river dashes forward under a chain bridge which connects two small villages clustered beneath vine-covered steep. The village on the right hand is Tournon, that on the left is Tain. Above Tournon rises a crag, castled most picturesquely, reminding you of Rheinfels or Ehrenbreitstein on the Rhine, and equally as good. Above Tain the hill is crowned by a more genial diadem. The village is shabby and dirty, but you forget it all while contemplating the overhanging cliffs covered with vines, stretching their tendrils from rock to rock and looking like green garlands arranged to orna-

ment the stern basaltic wall that hems in the rushing waters. Every slope of the hill is split into squares, triangles, and parallelograms, bounded by stone walls, and every one of these enclosures is filled with vines. Wherever a bit of sunlight promises a harvest, the peasants carry up baskets of soil and manure, and the result of this labor is the production of a grape from which the choicest wine in all France is manufactured.

Descending the Rhone a little farther we arrive at Valence, celebrated for being once upon a time the residence of Napoleon, when a poor unknown lieutenant. The intervening country is a fine alternation of smiling agriculture and the wilder properties of uncultivated nature—farms, vineyards, and thriving villages succeeded by bare hills and rugged rocks crowned by ruined fortresses of the predatory feudal times. Opposite Valence, surrounded by an extensive tract of corn land, rises a bold peak of rocks unusually lofty, and crowning the summit is a nobly perched eyrie of a castle. A horrible story is connected with this old castle, the property of a Protestant lord, the Seigneur De Crussol. During the theological wars this noble was a prominent actor. From his stronghold he would rush down with his steel-clad men-at-arms, and laying siege to some unfortunate abbey, secure prisoners and booty and then retreat to his mountain fastness again. The wealth thus gained helped to increase his power. The prisoners, unless they preferred to renounce Catholicism, were flung into the "chimney of Crussol," whence flying down eight hundred feet through the yielding air, nothing but indefinite masses of horror could be discovered of them after.

A half-crumbled, cavernous looking recess is noticed in the thick wall. You think at once that it might have been a fireplace. But this fireplace has no back, and fuel flung in there would roll out at the orifice behind, tumbling far down into the smiling valley below. This is the chimney of Crussol. Those were cruel, bloody days. Both parties were unforgiving, merciless. At Béziers, so runs the legend, true or false I cannot say, the pious bishop thereof ordered twenty thousand Protestants slaughtered, which was unhesitatingly begun by the soldiers, but night coming on they declared that they could not distinguish the Orthodox from the heterodox. "Well, no matter," replied the episcopal dignitary, in Latin; "Kill them all! the Lord will recognize his own."

To turn, however, to a more pleasant theme. Do you remember Avignon, the holy city, at present sad and gloomy like a fallen power, who looks at herself eternally in the Rhone? Once she wore the papal tiara on her brow; once she vied with Rome, the imperial city, in luxury and pomp, in vice and voluptuousness. Here kings and princes thronged to do reverence to the successors of St. Peter. Here Rienzi and Petrarch have left memorials of their names—the one in the dank, stone vaults of the Pontifical palace—the other in the musical murmurs of the fountain of Vaucluse. For nearly a hundred years Avignon was the centre of all that was noble, learned, and exalted in Christendom.

It was Philip the Fair of France, who, snatching at the papal crown that had fallen from the head of Boniface VIII., from the buffet given him by the fierce Colonna, had placed it on the brow of Bertrand de Goth, and who, to unite in his own hand and in that of his successors the power, spiritual and temporal, conceived the gigantic project of disinheritng Rome of its Catholic royalty, and of endowing France with it. Clement V., sacred lord of the Vatican by the grace of the French king, dwelt in Avignon, and the Rhone saw the Vicar of Christ stretch forth from his balcony that hand which binds and loosens, and the French people heard for the first time pronounced within their borders the universal benediction, "Urbi et orbi." This was in 1309. The seventy years that followed were the brilliant days of Avignon history. She was girdled with a new belt of ramparts by the Grand Master of the Order of Malta, endowed with palaces and churches and magnificent wharves, by John XXII., Benedict XII., Clement VI., and Urban V. Her court rivaled in splendor any of the royal courts of Europe. Secure in that tranquil seat of power from the threatening violence of the turbulent Roman nobility, the courtiers of the See relinquished themselves to a holiday of delight. Her licentious cardinals and mundane abbesses devoted their repose to enjoyment and pleasure. They lived by day in an atmosphere perfumed by the incense of ceremonies and fêtes, by night they feasted voluptuously while music and poetry charmed the passing hours. All was gayety, brilliancy and sin. But amid the councils of faction and the orgies of debauch an air of literary refinement was diffused by the genius of Petrarch.

## NOTES AND QUERIES.

**Apparitions.**—Being a constant reader of the *AMERICAN MONTHLY*, and having derived much interesting and valuable information therefrom not obtainable elsewhere, I am prompted to seek, at the Editor's convenience, if agreeable to him, such ideas, suggestions and light as he may be able to give on the subject of Apparitions. There is so much mystery connected with the subject, of both a strange and curious character, that I feel sure that many friends and subscribers of the excellent *MONTHLY*, besides myself, would appreciate its ventilation.

A. Z. W.

The Editor's disposition is to disseminate truth whenever he can command it, and find recipients for its diffusion. In touching, however, the subject of APPARITIONS, there are two difficulties in the way of accomplishing much good: a dearth of intelligible information attainable, and a general predisposition among mankind to believe in whatever is mysterious to the naked and unadorned truth. Incredulity in matters of business and finance, and want of faith in the future, are in healthy growth; but as applied to phantoms and improbabilities they seem to pine and wither like leaves in the autumn. Superstition has survived the shocks of time and the dazzling glory of knowledge, and to-day, as of yore, it musters an army under every government beneath the sun. Tradition still wields a power almost invincible, and the hoary-headed sage to the prattling child transmits, as did his sires before him, the story of strange sights and sounds associated with some portion of somebody's history. The more marvelous these stories are, the more charming and fascinating, or the more terrible and impressive they are to the young, and thus, in early life, imagination is given wings to soar into the darkness and the unknown. Truth welcomes light, but Error clings fondly to that which will not bear reason's rays of revelation. Shakespeare says:

I think it is the weakness of mine eyes  
That shapes this monstrous apparition.

Had he said "it is the weakness of my mental vision," he would have come closer to the truth. Apparitions only put in an appearance when the powers of conception have swung out of their natural orbits. The strange and wonderful figures which stand before us as real, after all have only an interior or subjective existence. They are but the sparks of excited conceptions, magnified into bewitching forms or terrible monsters. Thus come apparitions of angels and departed spirits, which figure more largely in the history of apparitions than other objects of sight. From the same cause, landscapes, mountains, rivers, lakes, precipices, festivals, armies, funeral processions, horses, chariots and temples seem to pass before the physical sight. Nor are these apparitions confined to the sense of sight. Hearing and touch marshal their subjects, growing out of the overwrought faculties of the mind. At times we seem to hear sounds, and feel touches when stillness reigns, and all motion is in repose. Such manifestations are more frequently seen

among children than adults, as their minds are more susceptible and easily excited. In youth these phenomena come less frequently, and as age creeps on apparitions are rarely witnessed. These facts go to demonstrate that the fires which illuminate the conceptive faculties are the sources, in an eminent degree, of what we sometimes call the mysterious. As we grow older these fires burn less brightly, but with more mild and uniform flames. Judgment becomes matured, and mind-sight clearer and more reliable. And wisely it is so ordained, for the older can more safely guide through the thorny paths and mountain passes of life the young committed to their care. Children, it is well known, are constantly projecting their inward conceptions into outward space, and erecting the fanciful creations of the mind amid the realities and forms of matter, beholding houses, men, towers, flocks of sheep, clusters of trees, and varieties of landscape in the changing clouds, in the wreathed and driven snow, in the fairy-work of frost, and in the embers and flickering flames of the hearth. We are sure that this was the experience of the early life of Cowper, for he has embodied it in a fine passage in his poem of the "Task":

Me oft has fancy, ludicrous and wild,  
Soothed with a waking dream of houses, towers,  
Trees, churches, and strange visages expressed  
In the red cinders, while, with poring eye,  
I gazed, myself creating what I saw.

Beattie too, after the termination of a winter's storm, places his young Minstrel on the shores of the Atlantic, to view the heavy clouds that skirt the distant horizon:

Where, 'midst the changeful scenery ever new,  
Fancy, a thousand wondrous forms describes,  
More wildly great than ever pencil drew:  
Rocks, torrents, gulfs, and shapes of giant's size,  
And glittering cliffs on cliffs, and fiery ramparts rise.

Excited conceptions which are merely transitory, are frequently called into being in connection with some adversity, grief or anxiety, but these are easily distinguished from such as are based upon the passions of love, jealousy or hatred. As an illustration, a person standing on the seashore, looking out for and anxiously expecting the arrival of his ship, will at times see the image of it, and for the moment will feel certain that the object of his anticipations is in clear view, while in fact no vessel is in sight. That is to say, the conception, idea, or image of the vessel, which it is evidently in the power of any one to form who has previously seen one, is rendered so intense by feelings of anxiety, as to be the same in effect as if the real object were present, and the photograph of it were really formed on the eye's retina.

As bearing on this thought, we may be allowed to relate some instances connected with the captivity of Mrs. Howe, who in 1775 was taken, with her seven children, prisoner by the St. Francois Indians. During the period of her imprisonment or captivity, she was informed at a certain time by the Indians, that two of her children were no more;

one having met a natural death, and the other one had been knocked on the head. "I did not utter many words," says the mother, "but my heart was sorely pained within me, and my mind exceedingly troubled with strange and awful ideas (referring to images or conceptions). I often imagined, for instance, that I plainly saw the naked carcasses of my children hanging upon the limbs of trees, as the Indians are wont to hang the raw hides of those beasts which they take in hunting."

Turning now our attention to another form or phase of excited conception, that of *sound*, we find that it is less vivid as well as less frequent than that of sight. There are numerous cases, however, on record of such phenomenon. In our own observations, and perchance in our own experience, our attention is sometimes arrested by the supposed hearing of a voice as if calling, or in distress. It may be, as is generally the case, that no one except the one that calls for silence, hears the noise, or supposed voice. This sound is but another form of internal conception of that particular voice. Is it not more than probable that this theory solves the mystery of what has been related by Boswell as a singular incident in the life of Dr. Johnson, *i. e.* that while at Oxford he distinctly heard his mother call him by his given name, although she was at that very time in Litchfield. What is related by Napoleon is explained by the same principle. Prior to his Russian expedition, he was frequently discovered half reclined on a sofa, where he would remain several hours, buried apparently in profound meditation. Occasionally he would start up, convulsively, and with an ejaculation. Imagining that he heard his name, he would exclaim, "Who calls me?" Such exhibitions of sudden surprise are legion. Wherever humanity finds footing, there these idiosyncrasies of the mind occur. They have the same origin as the sounds which aroused Robinson Crusoe from his sleep, when there was no one on his solitary island but himself; they are the sounds we often hear in forests' wild, in mountain glen, on placid lake, or the prairie air:

The airy tongues, that syllable men's names,  
On shores, in desert sands, and wilderness.

These highly exhilarated conceptions appear to lose their moorings to judgment, and when they are protracted and specially vivid, they affect the belief of their subjects hardly less powerfully than the original perception of truth itself.

Our ideal faculties are of such delicate texture, and the principles which govern their operations so complex that we cannot hope to elucidate their offsprings in all their incipient and later stages of development, in a short magazine department article. The whole subject of apparitions, however, is so interesting that we will give one or two other views of it. Inflammation or diseases of the brain favor the sight of strange objects. Shakspeare, in explanation of the apparition of the dagger which appeared to Macbeth, says,

A dagger of the mind, a false creation  
Proceeding from the heat-oppressed brain.

In regard to spectres, they generally are mental illusions, caused in the main by perverted vision. They are usually seen at night and in the dark, and as a rule correspond with some previous conceptions. If, for instance, the ghost be the *spirit* of one with whom we have been particularly ac-

quainted, he appears with the same lineaments, but generally a little paler, though with the same apparel.

Now does not the principles we have endeavored to set forth illustrate many remarkable incidents found in both modern and ancient history? The alleged presence of the ghost of Caesar to Marcus Junius Brutus on the plains of Phillippi, is certainly at least evolved by their application from much doubt and obscurity. In the play of Julius Cæsar, we have this passage:

How ill this taper burns! Ha! who comes here?  
It comes upon me; art thou any thing?  
Art thou some god, some angel, or some devil?

There is a higher and broader view which may be taken in regard to *many* of the so-called apparitions, and that is the spiritual. The lives of many good and worthy people, whose temperate habits and integrity of character are beyond the pale of doubt, furnish stable ground for the belief that actual spirits, after the departure of their original tenements, revisit their old haunts and scenes of the by-gone life, and hold intercourse with the living, in sundry forms and varied manners. Theologians generally ignore this idea, although the Scriptures abound with illustrations of such revisitations, notably where the dead Samuel appeared, through the Witch of Endor, unto King Saul, when in sore distress.

**A Problem for the Curious.**—China was one people and one kingdom a thousand years before that half-mythical period when the Greek heroes led their followers to the siege of Troy, and it has maintained, ever since, unbroken, the identity of its language, its national character and its institutions. What changes, what overturnings and reconstructions, has not every other part of the world had to undergo during that interval of four thousand years! There alone upon the earth's face does stability seem to have reigned, while revolution has been elsewhere the normal order of things. We say deliberately stability, not inaction. China has known during all that time as constant action, often as violent commotion as other countries, and in many respects not less real progress; had it been stagnant only, had there not been in it a healthy vital action, it must long since have perished in inanity and putrescence; but, far from that, China has seen within the last two hundred years one of its happiest and most prosperous periods. Here is a problem for the student of history, of which the interest cannot easily be overestimated. How have the Chinese succeeded in finding and maintaining the stable equilibrium which other races have vainly sought? Is it in their character or their peculiar external circumstances, or in the wisdom with which they have harmonized the two, that their strength has lain? As we look upon this venerable structure, the sole survivor of all the fabrics of empire reared by the hands of the men of olden time, we can hardly help wishing that it might have been left to stand until it should fall of itself; that the generations to come might have seen whether it yet retained enough of the recuperative energies which had repeatedly raised it from an estate far lower than that into which it was seeming now to have fallen, to give it a renewed lease of its old life, a return to its ancient prosperity and vigor. That is now no longer possible.

## CURRENT MEMORANDA.

**Sowing and Reaping.**—The scattering of seed by the soil-tiller, and gathering, in due season, the rewards of his faith and labor, are but illustrations of the teachings of the greatest Reformer the world has ever known. The Parable of the Sower possesses a force and beauty not weakened nor marred by time. It announces to day, as it did at the dawn of Christianity, a great truth; it promulgates a lesson, only made grander and nobler by the light of science and the experience of mankind. The principle designed to be impressed upon the minds and hearts of the multitude who stood on the sea-shore, was not to be confined to the WORD of the KINGDOM, AFAR OFF, but its application was intended to be broad, so as to bear upon *secular* as well as spiritual things. The wayside, the stony places, the thorns, and good ground, most happily and clearly indicate the character and distinctions of the soil, whether as referring to the heart or the mind of a single individual, a corporate body, or the many who go to make up a Church, State, or Nation. TRUTH was to be received and nourished in order to bring forth abundant harvest.

Now, according to this standard, and following the line of thought suggested by our caption, let us group a few retrospections in individual and governmental history together, and ascertain, if possible, where we stand and whither we are drifting. In one group we see municipal and State officers, high in trust and power, spurning the truth and accepting stipulated prices for their votes and influence in behalf of a corrupt charter for the government of the chief metropolis of a great nation, while the revelator, still a prisoner, furnishes this intelligence to the world, as part consideration for his release. One of these officers, once a District-Attorney and friend of the Drama, is now spirited away across the ocean, eluding the execution of that law which he was sworn to defend. Another, a Representative in the legislative halls, ignoring the sacred character of his oath and that modesty which accompanies honor, takes flight for Southern skies, hugging the delusion that ill-gotten gains will secure happiness.

A second group shows us *Guardians of Widows and Orphans* in Saving Banks and Trust Companies, allowing "the care of this world, and the deceitfulness of riches to choke the WORD," only to reap for them undying shame.

Drawing our vision down to the present time, we see the chief officer of a great Exhibition (the child of the Centennial) and President of a city railway (second to none in the country), straining conscience and confidence by over-issuing stock in amounts reaching into the hundred thousands. The honest shareholders did the sowing, but "not in good ground." And lawyers, brokers, and confidence men, some of whom, holding the dread secret of trust betrayed, bleeding, as is alleged, the chief and central figure, as the price of non-revelation, help to complete this picture.

Still another group of the unfaithful is witnessed, and it is representative of the sacred profession. The robes of priests of holy temples are stained with records of lust, and

the chastity of female character and the purity of the family circle are made to succumb to the polluting influences of hypocrisy.

And, not content with plundering civilized communities, other rings invaded the habitations of the untutored savage, and made him the victim of their debasement. In these groups we find trusted agents of the Government, who have added to their coffers at the expense of depleted supplies, guaranteed under sacred treaties. Witness the result! revolting tribes, war, massacre, and desolation. The gallant Custer and his brave men in arms slain in the Western wilds, and homes put in mourning as the cost of such treachery. And now, again, the red Chiefs are called to Washington that another treaty may be made, and we fear only to be violated. Hear Spotted Tail, in the Grand Council, to the President:

"My Great Father, I have come to your house to-day with a happy heart. I see you and shake hands with you with a good heart. I wish to talk to you about business. It is a good ways where I come from. The country I live in belongs to me and belongs to the government. I have come to find out where is the best place to remain. Where I live there is a good deal of talk about my agency. A line has been drawn from where I am from the Black Hills toward the Big Horn. I do not understand the line. All I know is they are trying to frighten us into this business. That's the way I came to sign the paper that I did (meaning the agreement of last fall). They told me at the time that my Great Father sent the men there for the purpose of treating for the country. If so, I am willing to treat. They told me a good many points not kept up in the old treaty should be given to us in the new, and said if I signed all I wanted would be given according to their promise. They told me then if I did not sign they would send me south or across the Missouri river. Although I signed without their telling me exactly what they wanted, I wanted to tell them how I was to live after I signed the papers, how many cattle and agricultural implements I was to have and other things. That's the way they treated me. I know one thing; it is this: When a white man owns land he builds a fence round it and it is his so long as he doesn't sell it. That is the way white men live. But your people don't ask questions. You take our lands from us. Before the white men came to us we had a good time in taking care of our property, but now, as I told you, we can't do it. Your people make railroads and drive away the game, and thus make us poor and starve."

There is the eloquence of simplicity in this appeal for justice, and a confirmation of the prevailing idea of unfair dealing on the part of the white man. And we are now reaping the crop grown from injustice.

The seeds of slavery brought forth their legitimate fruit, the most terrible domestic strife known to history, only to be followed by suffering, and business and financial disaster. Nor is this all. The great struggle brought in its wake ill-gotten gains, extravagance, indolence, and a depraved virtue.

The desire among the many for rapid accumulations of money and property, fostered by the incidents connected with the war, has taken such a strong hold of some minds, that honor in both private and public life has been in no small degree swept out of the market. The love of dress and display has also become so inflamed that simplicity and economy are almost among the lost virtues. The present conflict between Capital and Labor is only one of the natural offsprings growing out of exhausted treasuries. We had hoped for the dawn of brighter skies in the moral world with the incoming fall, and as a sequence, a healthy current in the avenues of business; but just as we begin to look out with hope, a dark cloud casts its shadow and gloom upon the marts of trade.

The question which now confronts us is, "Are we, as a people, to be made better by these tribulations? To us, at least, one thing seems sure, *i.e.* that each new revelation of crime is a precursor of reform. History leads us to believe that when broken pledges, plighted faith, and falsehood so multiply as to taint the atmosphere of the major portion of an enlightened community, revolution is destined to follow. The world is only lifted up on to higher planes of thought and action by witnessing and suffering from the evils of moral depravity. As a nation, we are too vigorous to crumble like Rome, when invaded by the Gauls and Lombards.

Amid all these clouds of moral obliquity we think we see fair promises of a bright future. As the curtain rises, other groups lead us to hope. Chief among these is found the nation's President and his able Cabinet. We see the true spirit of reconciliation growing under his non-sectional policy. The cordial reception which the people of the South have given him while "sweeping the circle" are the best evidences of the return of better times in the near future. Hands have been clasped containing the hearts of the representatives of the two great sections of the Union. Capital moves, and with it muscle and brains, across the line; and already the hum of mill-wheels and the song of educated industry swell the chorus of "better times." Railroads are being rebuilt, new settlements made, and a general move towards a new era.

In the principal commercial centres in the North, the volume of business for the past month shows renewed activity in nearly all departments of trade, giving us more than a glimpse at "the bow of promise."

We have only to keep on sowing the seeds of reform in every circle where education, religion, and traffic are found if we would achieve substantial prosperity through an abundant harvest. Let us look at the bright side. In that is Hope.

**At Home and Abroad.**—The International Rifle contests as practiced at Creedmoor and Wimbledon have earned for all the leading spirits engaged in them lasting praise, but to the American Team is due the double honor of two signal victories, fairly won, with competitors skilled and experienced. Such exhibitions of clear-sightedness and self-possession, intelligence and manly courtesy as are displayed in these struggles for supremacy have more than a local bearing and mere passing interest. They are indicators of the progress of nations through their representatives; progress not only in marksmanship, but in the cultivation of the social elements, and that fraternal feeling which knits more closely together nations and communities.

In the political world the geese are flying high in the blue skies. Men who more fully represent the population, and whose record for the light of day, are being made, have more healthy principles than in past times. The balance has been squared, and the President more at their posts of duty. The North and the South, destroyed, have been restored, and the business more advantageously than they have encouraged confidence, and integrity.

New Jersey has brought again a date for Governor, General George F. Edmunds, congratulating the supporters endorsing the Democratic principle out by a Republican President.

In New York, Senator Conkling, in convention and out of the Republican family against its policy of the national administration endorses it. From the proud and manly man, it is mortifying to see *rule* serve to wreck the noble reputation and pride of the Empire State.

In Ohio and other States the people are a triumph of reform; and we hope—for the fullness of the sea—only was found the dregs of adversity.

Abroad, the military strife has developed into a great war, and appalled at the reported atrocities, the printed papers and sensational sheet and terrible pictures of the cruelty of the war, and we are slow to believe the largely of the sensational. One writing, *i.e.* that the strength of Russia, measured by Russia, and that the already brought defeat and shame in command of the several corps of history is teaching in this war, as it is numerical strength is no sure guarantee of *will power*, when controlled by editorial leaders, frequently batter down its own in number. The Crescent is in triumph. Plevna is being deep all these disasters, gallant little Serbia, her banner, winning victories all hesitating Servians, and conserving opportunity to make their power may not come again.

In France, the Provincial cantons, representing all shades of opinion, have addressed to the nation. It is the manifesto of MacMahon's manifesto. The following passage: "Your duty will be of those who presume to impose that cannot become the instrument of must have Republican functionaries, order, peace, and stability through

## LITERATURE AND ART.

**Sculpture.**—We have given the readers of the MONTHLY in preceding numbers ideas and principles relating to the Fine Arts, but have, in the main, confined ourselves to the department of Drawing and Painting, and the rewards associated with the artist's profession. These rewards are twofold—one of pleasure, the other of a compensatory nature.

The intellectual and æsthetic enjoyment in witnessing our own creations on canvass or in stone, is probably among the superlative pleasures of this life. The monetary reward, at least, is but a small tribute to either genius or art-talent. Here and there we see isolated cases of artists becoming wealthy, according to the world's standard of wealth. The instances, however, are so rare that were it not for the inherent love of the beautiful, and the consequent striving to attain it, galleries of art and beautiful homes would gradually disappear. But, fortunately, taste is a perception of intellectual pleasure within itself. Beauty, the object of taste and source of pleasure, becomes potent in its influence just in proportion as we are able to approximate the true ideal, NATURE, with pencil, brush, or chisel. There is a sort of charm which broods over our labors when their objective is a reproduction of life in some, even if not in all its parts. This life, as connected with the vegetable kingdom, is more specially the province of the brush and the pencil. Flowers and plants, woods and lakes, mountains and plains, rivers and rivulets, all form suitable subjects for the easel. They all exhibit, however, non-intellectual, though animated creation, conforming to NATURE's laws in their growth and decay.

When we come to the intellectual order of creation, here sculptors find their themes the objects of their highest emulation. Hence, we find that real or typical human characters, as seen in life and death, in peace and war, in defeat and victory, have been chiefly the subjects for the sculptor's chisel in ancient as well as in modern times. As lord of creation, man has almost alone been wrought in stone and marble, and to this fact are we indebted for much of what we know of the past, regarding governments, rulers, the arts and sciences.

As to the origin of sculptural design, much has been written, many conjectures made, and theories advanced, each

asserting for some favorite nation or people the honor of invention. Of all the imitative arts, we are led to believe that sculpture was one of the first which called into exercise the thought and ingenuity of mankind. The production of tangible forms corresponding to the reality, would seem to be the most natural way to imitate nature. We see evidences of this in the rude carvings on the spear-shaft or canoe of the Indian, and that these exhibitions of his skill surpass all

others. The history of sculpture, therefore, dates back to a time almost coeval with the earliest formation of society. The chronology of ancient empires sustains this opinion or belief. All the kindred arts, with which taste and feeling are mingled, have their birth and subsequent improvement in the same universal principles of the human mind; principles mysterious and powerful in the achievement of the greatest good to the human race. Endowed with these, man seeks now, as in the long time ago, the haunts of NATURE to gather the great lessons of truth and inspiration which she continually furnishes. Feasting on these, his untutored

STATUE OF A FEMALE, FOUND IN ROME.

mind is kindled as with a new life, and his soul drinks in from inexhaustible fountains. Thus, by communing with the Great Architect through His models, he aspires to imitate the works of His hands. It is thus that human achievements are ever copies after the Great Artist. The process of education has been going on since the dawn of time, and the fruition in a larger degree than all who have preceded us, is our special privilege, in this nineteenth century of the Christian era.

Handed down for us to enjoy are the art creations of those who have gone before. Piety, Patriotism, Friendship, Devotion, Gratitude, Admiration, Faith, Hope, Charity, Humility, Reconciliation, Courage, Love, Anger, as attributes or virtues, we now see in stone and brass. The sculptor's chisel has placed these representations of the virtues and vices, so indissolubly connected with human history, in the markets of the world. And to these are added sculptures of men and women who have shed lustre upon their race and kin. And we rejoice to know that the American people are moving toward the front in this direction. In no better way can we, as a nation, perpetuate the grand principles and blessings of a republican form of government, than by the sculptor's

chisel. To this end, we should foster art-talent and art-schools by a still more liberal policy than that now pursued. That

NIobe AND HER CHILDREN.

education which cultivates a love for the true and the beautiful in an eminent degree elevates, refines, and secures happiness to any people. The Fine Arts of a nation are generally safe indexes to its character.

Glorious thoughts and grand principles are crystalized in such enduring forms in sculpture that we gaze upon such creations with an admiration akin to awe. How beautiful, and yet how true, the allegory of Grecian poetry, which feigns that Love, or the natural affections, taught man the art of genius! What an influence, silent though it be, do statues and statuettes exert wherever found! If our models be æsthetic, our homes are made happier and our lives purer by having them there. Paintings and Drawings embellish the parlor and drawing-room, and aid in moulding character; but it is left for sculpture to teach impressive lessons through the cycles of time. We turn to Egypt, which has been styled the cradle of the arts, and can see the conceptions and emotions of its earliest inhabitants in its carvings.

According to some authorities, there were three distinct eras in the history of Sculpture:

1. An era of original or native Sculpture.
2. An era of mixed, or Greco-Egyptian Sculpture.
3. An era of imitative Sculpture, improperly denominated Egyptian.

The first or true age of Sculpture in Egypt, ascends from the invasion of Cambyzes to unknown antiquity. During this period only were primitive institutions in full vigor and integrity, and public works, reflecting national taste, con-

ducted by national talent. The two remaining eras, extending downwards through the successive dominion of the Greeks and Romans, have been added in order to embrace the consideration of topics, which, though remotely connected therewith, have hitherto been regarded as integral parts of the subject. In examining the principles and character of this aboriginal school, there are still left two sources of judging with sufficient accuracy the merits of its production—vestiges of ancient grandeur yet existing on their native site—and the numerous specimens in European cabinets. These remains may be classed under the following divisions:

1. Colossal statues.
2. Groups or single figures, about the natural size.
3. Hieroglyphical and historical relieves.

In the formation of these various labors, four kinds of material are employed; one soft, a species of sandstone; and three very hard, a calcareous rock, out of which the tombs, with their sculptures are hewn; basalt or trap, of various shades, from black to dark gray, the constituent

STATUE OF THALIA, FROM THE BATHS OF CLAUDE.

generally of the smaller statues; granite, more commonly of the description named by mineralogists, as *granites rubicunda*,

of a warm, reddish hue, with large crystals of feldspar; though it is sometimes, though rarely, of a dark-red ground,

A GREEK BUST.

with black specks, as in the magnificent head, misnamed of Memnon, now in the British Museum. Colossal figures are uniformly of granite, in which also is a large portion of the relievos. Beside these, from the account of Herodotus, as also from the statues of wood actually discovered by modern travellers, we learn that even in great works, the Egyptian sculptors were accustomed to exercise their skill on that less stubborn material. Metals appear to have been sparingly used; at least, only very small figures have yet been found of composition similar to the bronze of later times. Yet the Book

of Job especially, and other parts of Scripture, would lead to the conclusion that even colossal figures were, from an early period, cast of metal. In the tombs, as those near Thebes, small images of porcelain and terra cotta are frequently found.

In ancient Egypt, we are told by the writers of Greece of such numbers of colossal statues that it appears almost incredulous, especially when we consider the magnitude of some, and the materials or compositions of others, were the account not well authenticated by countless remains. In most of these, there are striking evidences of a disregard of time, patience and toil. Of these mighty labors, some are hewn from the living rock and left adhering to the natural bed; as the celebrated Sphynx, near the Pyramids of Ghizeh, and various sculptures on the rocks of the Thebaid, which seem like the shadows of giants cast by a setting sun.

To the second class belong both the earliest and latest works of the Egyptian chisel; yet, between the worst and the best, we find no diversity of merit corresponding to the lapse of time—a certain proof that the principles of the art were fixed at an early period of its progress and on a basis independent of its precepts. In every specimen, without exception, which can be ranked as Egyptian, a pilaster runs up the back of the figure, no matter in what attitude it may be represented. The origin of a practice not natural, in an art professing to copy Nature, must be sought for in some external circumstance of its primitive history. Some such circumstance is plainly discernible in works still remaining in the excavations of Philae, Elephantis, Silsilis, and at El Malook, in the tombs of the Theban kings.

At the period to which we refer, anatomy and drawing appear to have been in their infancy; the limbs show no joints, and the movements exhibit neither balance nor elasticity; proportion and perspective seem to have been unknown. Military engines, buildings, horses, soldiers, all appear of the same dimensions, and all equally near the eye. The

heroes in all these monuments bear striking resemblance. They exhibit youth and victory, and show beauty and grandeur mingled together. Sculpture shows us everywhere monuments of courage, but it also reveals to us the fact, that in all ages no inconsiderable proportion of the human family have been the dupes of fears and phantoms, and also that man-worship runs back to time immemorial. In our own day, and on both continents, this deifying prominent character still goes on. This custom can lay claim to some merit, as it exerts a wholesome influence upon the mind and spirit of the age. Especially are the youth of the land stimulated to renewed efforts to become prominent characters in history. Upon this point a chapter might be written profitable to the American student, but our limited space obliges us to forego that pleasure now, as it would be a departure from the main object in view, which is to awaken the latent thought of the rising generation to the benefits, beauties and glories belonging to Sculpture as one of the Fine Arts.

Our illustrations tell their own story so well that no remark of ours would enhance their value. For the information of those not versed in classical mythology, it may be well to say, that NIOBE was the daughter of Tantalus, and one of the Pleiades, married to Amphion, king of Thebes. Proud of her numerous offspring, she provoked the anger of Apollo and Diana, who slew them all. She was herself changed by Jupiter into a rock, from which a rivulet, fed by her tears, continually poured. The subject of Niobe and her children was a great favorite with the ancients, and it has furnished a broad field for sculpture among modern artists. This story,

NIOBE—AN ANCIENT BUST.

like many legends and fables handed down to us, is very pretty, and shows the ideal and imaginative power of the

minds of past ages. We trust it will lead to a better understanding of the men and women who have figured conspicuously on the stage of life in human history, and add to the votaries of Sculpture, as one of the elevating and refining influences of the world.

**The Centennial History of the Battle of Bennington.**

By FRANK W. CORBURN. Boston: George E. Littlefield, Publisher.

This is a small publication, 12mo, and some seventy odd pages, setting forth in readable form the main facts bearing upon the battle. In the introduction the author says: "I have endeavored to present a comprehensive and faithful account of the battle fought near Bennington, August 16th, 1777. I have consulted, in the preparation of the work, the Collections of the Vermont and Massachusetts Historical Societies; Records of the Council of Safety of Vermont, etc." Gathering his information from such sources, the matter may be accepted as worthy of confidence, and, we doubt not, will prove of general interest to the reading public and especially gratifying to the citizens of Vermont. We think, however, the engraving of General Stark—the frontispiece—does not add to the lustre of his memory.

**Proceedings of the New England Historic, Genealogical Society.** Boston: *The Society's House*, 1877.

Much valuable information is furnished in this pamphlet, and not the least are the lists of present members and officers, of the Society from 1845 to 1877. Among these names are many who have held, and others who now hold, prominent positions in connection with State and National affairs; indeed, it would be difficult to find an organization more brilliant in its membership. Among its present officers we notice the name of Hon. Marshall P. Wilder, of Boston, as President; Hon. Israel Washburn, Jr., LL.D., of Portland, Maine, and Rev. Asa D. Smith, D.D., LL.D., of Hanover, Vice-Presidents.

From the address of the President, we extract the following: "The library has been steadily increasing in the number of its volumes, in valuable manuscripts and rare autograph letters; and we are also gradually accumulating a collection of curious relics highly important to the illustration of the different epochs of our history. Our gallery of portraits is also increasing. The financial affairs of the Society have been administered, as in years past, with the strictest regard to economy, a principle of the greatest importance in all institutions, but especially in a Society like this." And further on in the address we read, "The year which has just completed its circuit will always be a marked one in the history of our country. It has quickened the interest of our whole people in our local and family history. It has told us over again, in greater fullness and truer proportions the aspirations and achievements of our fathers, and thus enlarged, enriched and endeared to us the record of our national history."

We are glad to note the spirit of patriotism with which this address teems, and the evidences of its prosperity. Such societies should be fostered, for they are instruments to preserve and perpetuate the ideas and deeds of our worthy sires and their successors.

**History of the City of New York.**

J. LAMB. New York: A. S. B.

Parts XIII. and XIV. of this careful and elegantly illustrated work ready to press, and we take pleasure in behalf. In clear type, on rich cream and publishers are giving to the history of the great metropolis ever taking into consideration its exalted Lamb in this work gives indisputable historical writer. The style is sufficiently animated to entertain, with history. On page 615, in speaking of Lancy, she says: "He was an breadth of knowledge, culture, may wit, condescension to inferiors and made him a general favorite with his was their friend and champion. His gilded chariot with outriders in hand envy; his grand old mansion on more elegant country-seat, were of habitants of the city." The citizens congratulate themselves in having the great characters who helped to written up.

**Minutes, Sermons, and Report of the Conference of the Congregational and the Maine Missionary Anniversary of the former, and of the latter.** Bangor: *Bangor Printers*, 1877.

This publication gives to the public proceedings of the General Conference with special interest the "Report of the Churches." This shows an increase for the last current year greater than exhibiting a net gain in the State twenty-seven members. This is fully justifies the expressions of gratification in the Report, which tells us: "It is an honor to borrow the words of a Song of David: 'The Lord turned again the captivity of his people, that they might dwell in their own land.' Then was our mouth open, and our tongue with singing: then said we, 'The Lord hath done great things for us; whereof we shall sow in tears shall reap in joy. He will weepeth, bearing precious seed, shall sow with rejoicing, bringing sheaves with showing speaks well for the discipline both Church and Society, and we will go on."

**Frank Forrester's Sporting Scenery.**

By HENRY WILLIAM HERBERT. New York: G. & Co., Publishers.

This is a new and revised edition of illustrative engravings, from designs by F. O. C. Darley. It is replete with

## SCIENCE AND MECHANICS.

**The Science of Living.**—In the MONTHLY we have devoted considerable space touching the problem at the root of the recent labor revolt, but have mainly considered the RIGHTS, WRONGS, and REMEDIES of the subject of CAPITAL AND LABOR from business and legal standpoints. Intimately connected with the question is the cost of living, and what kind of food, practically and scientifically considered, will best supply the muscle and brain-power of the laborer, whether that be intellectual or manual.

The subject as to how workingmen shall live is of such general interest, that we give the following table taken from the *Scientific American*, as prepared by the wife of a working man, showing a list of necessities on which her husband, herself, and five children (under nine years of age) subsist. This category, which is claimed to represent the cheapest and most economical living attainable by the compiler, we here republish, as we propose to use it as a text for some farther remarks in another issue:

WEEKLY.	DAILY.
Rent.....\$9.00	One quart milk, 6c.....\$ 42
One barrel wood..... 25	Two quarts potatoes, 6c..... 42
Two pairs coal..... 15	Two eight-cent loaves..... 1.12
Burial society..... 22	One and a half lbs. meat, 20c. 1.40
Oatmeal..... 14	Salt..... 2
Two pounds butter..... 60	Pepper..... 2
Three and a half pounds sugar 40	Mustard..... 2
Half gallon oil..... 9	Matches..... 1
Two cakes soap..... 14	Starch..... 3
One pound soda..... 3	Bluing..... 1
Half pound tea..... 25	Total.....\$3.47
Newspapers..... 12	4.50
Shaving..... 10	
Total.....\$2.50	Total.....\$7.97

It will be observed that this, among other things, is intended virtually as a practical answer to the question as to the minimum amount of food on which a family of presumably average size and weight can live without detriment to health. The ultimate destiny of food is, to quote Dr. Wilson, of Edinburgh, "the development of heat and other modes of motion, which together constitute the physiological phenomena of animal life." Food not only, however, supplies potential energy—which becomes converted into actual or dynamic energy—but it supplies the material for the development of the body. Hence inorganic and organic matters are both necessary, the latter, however, being alone oxidizable or capable of generating force. The organic constituents are divided into nitrogenous, fatty, and saccharine compounds—the inorganic into water and saline matters. Of these the nitrogenous portion constructs and repairs the tissues, it is the muscle and brain producer; the carbonaceous portion goes to maintain animal heat, aids the conversion of food into tissue, generates fat, etc.; the saccharine portion has heat-producing powers inferior to the fatty constituents, and finally the water and saline matters dissolve and convey food to different parts of the system, consolidate tissues, remove effete products, etc. In general, however, the phenomena of nutrition depend mainly on the chemical interchanges of nitrogen and carbon with oxygen, and therefore different articles of diet are estimated in nutritive value according to the amount of nitrogen and carbon they contain.

**Oriental Honors to an American Inventor.**—Thaddeus Fairbanks, the inventor of the scales bearing his name, who some time ago received from the Emperor of Austria the knightly Cross of the Imperial Order of Francis Joseph, has just been the recipient of the Decoration and Diploma of Nishan-el-İfticar, of the grade of Commander, from the Bey of Tunis. He is the only American manufacturer upon whom this honor has been conferred. Mr. Fairbanks was born in the town of Bromfield, Massachusetts, and is now in the neighborhood of eighty years of age. In the latter part of 1829 what was known as the "hemp fever" broke out in New York and Vermont. The farmers entered largely into the cultivation of the article, but the enterprise was ultimately a disastrous failure. Mr. Fairbanks lived in one of the districts where a great deal of hemp was raised, and the difficulty of weighing it by the old-fashioned method first suggested the idea of devising a more convenient kind of scale.

**College Architecture.**—In former days the first idea in connection with the buildings that were to enshrine an American college was the erection of a species of barracks for the accommodation of the students. Utility and economy were the guiding principles, and taste was utterly discarded. Hence the structures were usually hideous to the eye and utterly devoid of anything that could educate the artistic spirit of the youthful seeker after knowledge. It is not necessary to particularize in our search for examples. All the colleges in the last century bore a dreary uniformity in the stone and brick parallelograms that crowned the academic campus. Many a monument of this utter lack of a refining taste still defaces the fair sites of our universities and colleges, and pleads for the hand of the iconoclast who has sworn to spare naught that is a blot on the face of nature.

Happily the last quarter of a century has seen a change for the better. The beneficence of private individuals has found a method of benefiting the cause of education.

**Fall or Winter Painting.**—Good authority states positively that paint spread in the fall or winter will last twice as long as that put on in the spring or summer. When applied in cool or cold weather, it dries slowly and forms a hard surface or crust, while that which is spread in hot weather loses most of oil by being driven into the wood by the heat, leaving only a dry lead, easily crumbled off. Another advantage gained in fall painting is the absence of swarms of small flies that so often collect on the paint. Economy is secured also, as the wood absorbs less paint in cold weather.

**A Remarkable Railway Bridge.**—The new iron railway bridge over the river Douro, near Porto, Portugal, crosses it with an arch of a single span which measures 160 meters (520 feet) and has a rise of 42 meters (138 feet 6 inches). It is crescent-shaped in form; that is, the extrados and the intrados, which are connected by struts in the form of St. Andrew's cross, are farthest apart at the crown.

## GOSSIP AND NOTE BOOK.

**Nature's Teachings.**—The falling leaves of autumn rarely fail to awaken thoughts not crowded with past events and pictures of coming realities. They make suggestions in their own modest way, scarcely less impressive, at times, than the "silver-tongued" orator on the lyceum platform. They tell us that summer, with her scorching sun and torrid winds, has completed her annual visit, after having made beautiful and fruitful mountain, valley, forest and glen, and the heart of the husbandman to leap with joy. It requires no renowned linguist to read the simple story. On these gold-tinted garments of tree and vine, are written infallible teachings and sublime truths. In them we see the elements of science, the models for art, the emblems of mortality, the hope of resurrection, the evidences of Omniscient intelligence. The seed only dies to gain a new life; the leaf only sings as fanned by the breath of Deity, and drops from its parent stem to assume other forms, to dissolve, and become restored to its original elements. Matter is not annihilated, nor space destroyed. In what forms these leaves will reappear in the course of another revolution, is known only to Him who controls the planets and regulates the seasons. This lesson, however, is not a mystery. These crimson and variegated emblems admonish us of chilly winds and biting frosts; they turn our minds from the outdoor to the indoor world; from the seaside and lake, the forest and dell, to the bright fire and happy circle of friends and kindred at HOME.

This change of season creeps on so silently, that ere we know it, the echoes of departure are heard along the line. The "good-by!" and the "good-morning!" as recorded on Time's dial, saddens memory and brightens hope everywhere. Editor and reader in spirit have clasped hands many times, and often have we thought that in each a heart was found. Say what we will, there is a sort of inspirational communion between reader, editor and contributor, which mind can know and heart can feel, while the world at large moves onward heedless as the river toward the sea. The future of the AMERICAN MONTHLY, we feel, promises rich stores for all. Its friends have multiplied at home and abroad, and we enter into our preparatory work for the new year with substantial evidences of a brilliant future. That the leaves of our tenth volume be replete with lessons not only drawn from Nature, but from the vast store-houses of history and humanity in all parts of the world, to elevate and beautify many additional thousand American homes, shall be our highest aim and fondest hope. Help us forward in the good work!

**The Language of the Clouds.**—The colors of the sky at particular times afford wonderfully good evidence. Not only does a rosy sunset presage fair weather and a ruddy sunshine, but there are other tints which speak with equal clearness or accuracy. A bright yellowish sky in the evening indicates wind, a pale yellow, rain; a neutral gray color constitutes a favorable sign in the evening and an unfavorable one in the morning. The clouds are full of meaning in

themselves. If their forms are soft, undefined and feathery, the weather will be fine; if the edges are hard, sharp and definite, it will be foul. Generally speaking, any deep, unusual lines betoken wind and rain, while the more quiet and delicate tints bespeak fair weather.

**Mind Culture.**—A cultivated mind may be said to have infinite stores of innocent gratification. Everything may be made interesting to it, by becoming a subject of thought or inquiry. Books, regarded merely as a gratification, are worth more than all the luxuries on earth. A taste for literature secures cheerful occupation for the unemployed and languid hours of life; and how many persons, in these hours, for want of innocent resources, are now impelled to coarse pleasure? How many young men can be found who, unaccustomed to find a companion in a book, and strangers to intellectual activity, are almost driven, in the long, dull evenings of winter, to haunts of intemperance and bad society.

**Prettily Said.**—A little girl said to her mamma, "Mamma, have you heard of the man that got shot?" "No, my child, how did he get shot?" asked mamma. "Oh," said young precocious, "he bought 'em."

**"If I Had a Mind."**—"Wordsworth," said Charles Lamb, "one day told me he considered Shakespeare greatly overrated. 'There is an immensity of trick in all Shakespeare wrote,' he said, 'and people are taken by it. Now, if I had a mind, I could write exactly like Shakespeare. So you see,' proceeded Charles Lamb, quietly, 'it was only the mind that was wanting.'"

**An American Knight.**—Our fellow-countryman, Cyrus W. Field, can add "Sir" to his name, as he has been knighted by Queen Victoria.

**Is She a True Type of the Race?**—Miss Josephine A. Sloan, a colored girl, graduated at the head of her class in the Rogers High School, at Newport, Rhode Island, recently, receiving the gold medal awarded to the first scholarship and pronouncing the valedictory. Her average in every study, on examination, was within a fraction of the maximum, which is 100. She took her last two years' study in one year, and excels in Latin, Greek, French, and German.

**The Doctor's Query.**—There was an old doctor, who, when asked what was good for mosquitoes, wrote back: "How do you suppose I can tell unless I know what ails the mosquito?"

**Precisely the Difference.**—"Gentlemen, I introduce to you my friend, who isn't as stupid as he appears to be." Introduced friend, with vivacity—"That's precisely the difference between my friend and myself."

## POWER AND PROGRESS OF CULTIVATED MIND.

BY ROBERT WINTHROP MARSH.

AMHERST COLLEGE—VIEW FROM THE COMMON.

SAY what we will about education being a dry or threadbare subject, it is one of the great topics of the day, and is destined to assume still larger proportions in the discussions and movements of the future.

In these days of leagues, unions, and strikes; of Communism, Mormonism, and free love; of speculation, fraud, and bad faith in high and low life; of tramps, rowdies, and criminals of every dye; of the growing prevalence of "the social evil," intemperance, pauperism, and manifold tricks and devices to live without honest labor; when society seems to be upheaving from its base, turning up things good and evil that strangely "multiform

and mix," and keep the world in a state of agitation and unrest; peace struggling for the ascendant, and yet war still ruling in the councils of the nations; some fighting, others protesting—in this state of conflict, vacillation, and change, thoughtful men naturally inquire, "What is to be the result or end of all this? Where is the mighty arm that shall lift the body politic and social from the debasement into which they have fallen? What potent influence can grapple with, and eradicate the giant evils that stalk abroad and threaten to destroy the very fabric of society itself? What organizing, controlling power, or plan, shall bring order out of confusion, restraining the evil and

strengthening the good? What puissant and charmed sceptre shall touch and calm the troubled waters, roll back the clouds of error and national vice and throw wide open the gates that shall let in floods of heaven-born light?" We answer that, under God, education, far more specific and practical, as well as general, than at present, is to be the great remedy; not working alone or in opposition to other good and saving influences, but leading and coöperating with them all.

For what does it mean but that the world needs and could profitably use more knowledge, skill, and inventive power; more intelligence, wisdom, and practical truth; that the intellectual and moral nature need elevating over the animal part; that all the higher faculties, aims, and aspirations require discipline and a full, harmonious development; that if we would redeem the race from low desires, selfishness, and perpetual disturbance and conflict, we must give them the capacity and disposition to reach up to a purer and calmer life; and that the best, if not the only way to do this is to educate them. This can alone be done properly by moulding and training the children, boys and girls, in the best sense of these words, according to their present meaning, or their possible significance in the future. Into the fountains of our schools and homes the salt must be cast, if the world is to be saved.

If any evidence were required beyond our own immediate observation and consciousness, as to the value of intellectual culture, and the part it is destined to take in the progress of the nations, as they move on in the march of civilized life; or emerge from the shades of barbarism, and sweeping away the mists of ignorance and superstition, advance to the front ranks of those nations and peoples who are contending with a noble emulation in the race of improvement—we need only to contrast Scotland with Ireland, both nations springing from the same Celtic race; the United States with Mexico and the Republics of South America; Japan with Siam; England with Spain; Germany with Russia, although the latter is rapidly coming up in the scale of progress.

More and more each century, and even decade of years, is it seen that public opinion and international law are coming to rule the world. A nation's weight in the grand council of rulers and people, depends in a great measure upon its cultured mind, its inventive skill, its literary and

scientific wealth, its financial ability, and especially upon weight of intellect among its leading men. It is true that a fine army and good fighting qualities in a people, add to its prestige and influence. But this is due to that relic of barbarism that can respect nothing that is not backed by physical force—a standard and test of national and individual greatness that is disappearing, happily for the world and to its credit too, before the advancing light of an era of reason and of peace.

The power and progress of cultivated mind has been gathering force and increasing sway for several centuries. We have a remarkable illustration of this in the past history of Germany, and her standing among the nations.

Even while cut up into petty kingdoms, and distracted by internal divisions, making her one of the weakest nations in Europe for offensive war, she yet ruled in the Republic of letters, in the empire of mind. In the great mental awakening and spiritual emancipation that succeeded the middle or dark ages, she dominated the ideas of the age, giving to the world international law, the rules of diplomacy, its theology, its methods of science. She did this through her cultivated intellect, profound learning, and eminent scholars and statesmen—her Vattels, Metterniches, Tholucks and Humboldts.

This was the Germany not of military glory and power, but of intellectual sway. This role of mind extends from the time of Luther to the death of the author of *Cosmos*. During that period, Germany had more influence over Europe and the world than she has to-day, with all her military prestige and renown.

To what does our own country chiefly owe its influence and standing among the nations now, and in the immediate past? Not to its army and navy, or even its war record or fighting muscle, but rather to its intelligence, intellectual stamina and muscle of mind—to its inventions and discoveries, its free institutions and unprecedented progress in population, wealth, and all that tends to the comfort and elevation of the masses. It is true the nation has made a good war record. But this is a late thing, and the world has taken but little note of it as yet. Our people are much better and more favorably known abroad for their railroads, telegraphs, steam-engines, sewing-machines, agricultural implements, etc.

The great International Exhibition, that dis-

played to the world our triumphs in the peaceful arts and industries, will do us more practical good, and add more to that spotless fame that shall shine down through the coming ages, than the temporary *eclat* and fading glory of a hundred battles. The wealth, the military power, and the battles of the ancients, we care but little about. But their architecture, their works of art, the genius of their

who wins a great battle, or even many battles. Perhaps Napoleon was conscious of this while reading, as he often did, Bunyan's "Pilgrim." Yet, it is undoubtedly true in this sinful and disjointed world, so full of paradoxes and *apparent* contradictions, that some knots must be cut with the sword, some causes baptized in blood, and precious rights wrested from tyrants by the strong

language, and the immortal words of their poets and orators, this and succeeding ages will never cease to admire and imitate. So too, in a few years *our* military achievements and prowess will almost fade from men's minds, or be regarded as a relic of a dark age—an age of passion and blood; while our conquests over matter and our achievements of mind, will shine on with ever-increasing lustre.

And here the thought occurs to us, that the man who invents some article of general use among his fellow-men, is a greater benefactor of his country and the world than the general of an army; and the writer of a good book may do more for his own generation and posterity, than he

arm of force, or protected by resistance unto blood.

So, too, it is intellectual culture acting upon the public opinion of the world, and that financial ability which comes from diversified industries, the direct result of that mental training which quickens the faculties and produces inventive skill, that has given Great Britain her supremacy among the nations, which, though somewhat less than formerly, is still a great weight and controlling influence in the councils of nations. Even in war, where low passions and brute force come into fierce and deadly collision, and where it is sometimes said weight of metal and numbers decide the contest, we see the power of mind over matter, of

intellect over mere physical strength and prowess. This was strikingly illustrated in the "Crimean War," as it is called. Russia had a population at least equal to both England and France, and had the very great advantage of fighting on her own soil. Yet the superior intelligence, the inventive skill, as embodied in the various appliances of war, the greater financial ability of the allied nations, and the combined strength that springs from freedom and the general diffusion of knowledge among the people, and which is felt among the soldiers as well as officers, was more than a match

for the one-man-power of Russia and the blind force of her then vast but unwieldy army. Weight of intellect and depth of purse turned the scale in favor of England and France, and gave them the victory.

An army of freemen is a thinking machine, and other things being equal, will always prove more than a match for the inert force of an army of serfs, or of ignorant, brutal mercenaries. Since that war, Russia has emancipated her people, and made great strides in all the arts and industries of modern civilization and the more advanced ideas of the age, whether relating to war or peace. We see the effect of this, and the bearing of the principle we are discussing, in the present war of Russia with Turkey. We have no doubt it will tell with increasing emphasis in the coming events and final results of the contest, proving not only the superiority of intelligence over brute courage in campaigns and battles, but the vital energy

Isaac Newton with Zerah Colburn, Longfellow with Joaquin Miller, and see what mental discipline will do for men. In each case the natural abilities are and were about equal. The one class is the diamond in the rough, that can scarcely be distinguished from the almost worthless quartz ;

The other is the polished gem  
That's set in Learning's diadem.

With the same, or equal natural powers, one man may live and die "alike unknowing and unknown," while another will sound the depths of philosophy and science, or rise to the stars in imagination's flight and the creations of genius, and write his name high on the scroll of undying fame. But intellectual culture and acquired knowledge

and each year thereafter, he sends out at least ten young men fully drilled. Each of these in turn becomes a teacher, and does likewise ; and so each of their students, in a multiplying ratio, that soon eclipses the celebrated problem of the grains of corn.

How, then, can mind-culture and the general diffusion of knowledge be regarded as a dull or hackneyed subject, so long as men believe in individual or national progress? The world of mind cannot rise an inch, nor the race advance a step, in real improvement, without it. The methods and even systems of instruction may vary or become obsolete, but the grand cardinal principles—its mighty power and glorious fruits—will

never grow old, nor can its great themes become tedious, except from the dullness of those who treat them.

When we discard education, or lose our interest in its proper discussion—when communities and nations come to this, they are prepared to open wide the floodgates of vice and social degradation, and to slide back into the midnight darkness of

barbarism. Even apathy upon the subject, is the sure indication of national decline.

The topic of mental training and the highest development of the physical powers uninteresting? Real knowledge, scientific skill, and practical learning are the guiding light of the nations—the salt of the earth—the lever that moves the world with more real power than the imaginary force of Archimedes.

Rightly viewed, it is of the very highest concern to man. No other interest or topic pertaining to this life is so important, and reasoning from analogy and the teachings of the Inspired Word, none can have a more important bearing on that which is to come. Evidently, this life is but the primary or preparatory school for the next. Here

philosophy, worlds and relations of intelligence life, we obtain, and we expand the the immortal great New wonderful disc achievement as having a pebbles on while an ocean ing onward lay unexplored

We need no better evidence of intellectual culture and the living interest of the public in many of our leading journals given lengthy articles on the them series of articles, the drifting in the direction of self training, and not unfrequently

plication to labor and the elevation of the laboring classes.

But it was not our intention to give a lengthy homily upon the subject, either in the abstract or concrete, nor to cite the views of leading educators; much less to put forth our own private opinions.

We will remark, however, in passing, that those

In seeking examples, we naturally turn to New England, the birthplace of public schools and the seat of the best colleges, academies, and other eleemosynary institutions as well as private schools. Here they were early established, generously endowed, and have hitherto maintained the highest standard of scholarship and general excellence.

That great lawyer, eloquent orator, and scholarly

VIEW FROM MOUNT PLEASANT.

opinions are radical and sweeping in their scope; for we believe that the system in vogue is superficial and inadequate, not to say obsolete, and destined to be removed, though we fear not soon enough for the good of the world. When it disappears, a method both more intellectual and physical, and far more practical, we have no doubt, will take its place. For that "good time coming," the glimmering twilight of which we can already discern, we must watch and wait. In the meantime we should make the best possible use of the facilities we have, for all education is valuable, and any system is better than none, if thoroughly applied. Instead of attempting to show what our methods should be, we shall rather be content with giving examples of what they are.

man, Rufus Choate, addressing the students of Dartmouth College, once spoke of that region substantially as follows: "New England, in territorial extent, is but an insignificant patch on the map of our common country, and has the most rigorous climate and sterile soil of any portion of the nation's magnificent domain. Restricted by its limited powers of production, and depleted by emigration, her census shows but a trifling increase in population from one decade to another; while the great West is making rapid strides in both population and wealth. Already the sceptre of empire has passed to the valley of the Mississippi, with its unprecedented growth and boundless resources, and it is evident that that favored region has before it a splendid future. Yet our own New

England need not be discouraged. She too has a bright future, a glorious mission before her. It is to furnish intellectual culture and cultured intellect for the whole country—to raise up noble men and women. New England, in fine, is to be the great breeding place of intellect."

This prediction was uttered by Mr. Choate more than twenty-five years ago, and doubtless the elo-

quent, subtle, and generally far-seeing man, who thus spoke of the then present, and prophecied of its future, sincerely thought that he could lift the veil and discern the realities of the coming years.

Since then, however, great changes have occurred in many things over our whole country, and in none more than in respect to schools and the intellectual culture of the people. The great West has not only increased in population and material wealth, but has adopted an excellent system of public schools, aided and stimulated it is true by a grant from the General Government of two sections of land to each township. Some of these States even claim to have made many improvements over the Eastern States. Prominent among these stands Illinois, whose system of schools is certainly

she has done, but gives a glorious promise, of what tl can and will accomplish in the intellectual culture of I

The Normal schools of th and well conducted; and v not all equal to those of so are constantly improving a standard; notably among tl lege and Pennsylvania Uni just rejuvenated herself, tak and in her fine new dress, si beautiful hills of West Phil stately as a Queen, giving p ful and brilliant career.

The schools of Philadelph

for their excellence, and are the pride and boast of her citizens. The graduates of her High School are found in almost every walk of usefulness and honor in the land. Even little Easton, one of the most picturesque and beautiful of Pennsylvania's provincial towns, and as public spirited and ambitious as she is beautiful, has something to boast of in her public and private schools. Her schools, and the mode of conducting them, so struck and interested that enlightened Emperor and sagacious man, Dom Pedro, that he called for and obtained a copy of all their documents showing their *modus operandi*.

It will be remembered that this town and its schools sit not under the *shadow*, but under the *light* of Lafayette College—are kept by her graduates—prepare many of her students for admission, and that, wisely, though an unusual thing in the history of colleges, there is the most perfect accord and coöperation between the College and the public schools, the professors and people. We say again, Easton has something to be proud of, and to tell to her children.

Wilmington, Delaware, has some of the best schools in the country; and the Peninsular State is slowly advancing towards the front line of learning's moving columns.

Baltimore, too, is doing much to lift up the standard and improve her schools and school system, not forgetting, but wisely providing for the thousands of colored children in her midst.

Washington also has good schools, that are constantly improving. The public schools are well conducted, and some of the private institutions of great excellence. That city, under free institutions, has had infused into it some of the best elements, as well as the worst, of the whole country. Among the former, we emphasize her educational improvements.

So, too, the whole South is awaking on this subject, not as universally as we would like to see,

and not always moving in the most enlightened and consistent manner. But under the stimulus of free institutions, and with the aid of the munificent Peabody fund, in addition to the sums raised by public taxes, they are wheeling into the line of intellectual culture, and may yet lead the van in the grand march of national progress.

Thus we see that New England, with all her

WALKER HALL.

vantage ground and the conceded excellence of her schools, must look well to her laurels or they will pale before the increasing radiance and manifestly growing lustre of those that adorn the brow and crown the head of her sister States. Mr. Choate's prophecy may fail, not from the falling off in the former, but by reason of the greater progress of the latter.

As yet the home of the Pilgrims, the land of "rocks and rills," bears away the palm of literature and learning. Her people, planted upon "a stern and rock bound coast," with a sterile soil and rigorous climate, are compelled to make the most of their intellectual culture and inventive skill. In this respect, that section reminds one of Scotland; and like the inhabitants of the land of

"John Barley-Corn," they are bound to have cultivated minds at home, and to thrive intellectually and socially wherever they live and wherever they go.

We will now turn to New England for examples, representative schools—showing where the children of America, and particularly at this time, "where the boys are trained."

To represent the colleges, we shall select not Yale, with her beautiful location in the City of Elms, her brilliant scholarship and imposing numbers; nor Harvard, with her vast wealth, high culture, and ancient and almost imperial renown. No, not these—there is an institution far less pretentious, and, as yet, much less noted in the world of letters, that has come quietly and almost noiselessly into notice, like the stone cut out of the mountains by an unseen hand; which has, little by little, moved into its true position, and taken its stand among the best of the higher institutions of the country. We refer to Amherst College, situated in the Connecticut Valley, the heart of New England, in a community largely composed of farmers, and which, with their excellent institutions, civil, religious and educational, and their marked habits of sobriety and industry, furnish the very best material for the higher walks of learning and of life—for scholars and for men. From this region, one of the most beautiful in this or any land, and from a community which is probably as intelligent and moral as any in the world, and very largely from the farming class she draws her material, her stock in trade. With these, however, there is a due share of the sons of professional and business men; but all, or the greater portion, part, full-grown, mature young men.

In witnessing the gathering of the students of this College at the chapel recently, nearly four hundred strong, we were struck with their large size, mature looks, and manly bearing.

There was every indication of intellectual and physical stamina; and we thought that good instructors ought to give a very good account of the use of such material, furnished to their hands to make up into cultured and noble specimens of true manhood, to become lights in the world, pillars of society. We have no doubt that this work of drilling mind and manufacturing the raw material into polished and useful citizens, will be well done by those who have it in charge; yet we confess

that we almost envied the professors their fortunate lot, and, for the time being, felt like coveting the privilege of moulding and training these promising young men; at least of taking part in the exalted and responsible work.

Their appearance is in striking contrast with the slight frames, pale, delicate faces, and juvenile indications which we have seen at some of our colleges of high standing. We will call no names, since comparisons are commonly regarded as odious.

Amherst College had its origin in the wants of Western Massachusetts—in the full need of an institution in the very centre of the great Connecticut Valley, not only for that particular portion of the old Bay State and that part of the valley, but extending its scope into other States. It was seen that this rich and prosperous region, composed largely of wealthy tillers of the soil, had marked characteristics and wants of its own. It was felt that those wants could best be met by an institution in their midst, after their own religious and social views.

Williams College was situated beyond the mountains, in the extreme northwestern part of the State, almost inaccessible at that time. Harvard was in the far eastern portion, and far too expensive for the means of most families—families who greatly prized educational privileges, and whose talents and moral worth the Commonwealth and Country most needed. Besides, the temptations at the latter college were such, from its nearness to a large city and the character of the young men gathered there, that many parents, however abundant their means, were unwilling to subject their sons to the dangerous ordeal. There was another motive that had a controlling influence with parents of decidedly orthodox views. It was that Harvard had relapsed into the most pronounced type of Unitarianism. It must be borne in mind that religious feelings and prejudices ran much higher fifty and seventy-five years ago than now.

For one reason and another, many of the young men of Western Massachusetts, and particularly the Connecticut Valley, were being educated out of the State. A very strong argument was based upon this fact, and the desirableness of training their sons at home, on the ground both of State pride and self-interest.

But Amherst did not have its birth and come into its present vigorous growth and useful being

without many throes and pains. It is the child of a long struggle and much self-denial on the part of its early friends. The bitter opposition it met with, the unjust and unreasoning conduct of its enemies and opposers, seems almost incredible, not to say ludicrous, at this day. But it was no joke, no holiday amusement to those who had the battle to fight. The very idea of opposing the praiseworthy efforts of the enlightened friends of liberal education who would enlarge its facilities and plant them where they were much needed, seems to our obtuse vision absurd and unjust in the extreme. It is like an effort to shut out the light, the pure free air, or an attempt to cut off the streams of that crystal fluid that God sends flowing and coursing through all the veins of mother earth, or pours down from the heavens into every man's cup.

When we read the record of the struggle it cost the friends of Amherst College and of sound education to give it a being and a name in the land, as recorded in the interesting and truthful history of Professor Tyler, we can scarcely credit our senses that such an effort to shut out the light of sound learning and sound morals could have been made in the nineteenth century, and in the enlightened and progressive State of Massachusetts. For three long years the struggle lasted, after preliminary efforts had crystallized into the form of an effort to procure a charter.

It is a striking illustration of the bad effects of that special legislation that is required in this State, for legalizing colleges, railroads, and all other corporate institutions. The whole system and its vicious fruits are a reproach to this grand old Commonwealth.

Amherst College was founded in 1821, though it hardly got into working order till 1825; and we may even say 1830.

It originated in a seminary established here some years before, much as Dartmouth College grew out of "Moor's Charity School." The first funds raised were fifty thousand dollars to aid Christian young men in indigent circumstances to prepare for the ministry. And the aid and educa-

tion of this class of students has constituted a leading feature of Amherst College from the first.

"The great object of this College has been," says Professor W. S. Tyler, who is authority on all these matters, "to raise up ministers and teachers." Nobly, indeed, has it fulfilled its mission! But let it not be inferred that only religion and the art of teaching are inculcated here. On the contrary, all branches of learning are taught most thoroughly by its numerous and accomplished professors, while in the classics, ancient and modern, and in mental

LIBRARY, PRESIDENT'S HOUSE, AND COLLEGE HALL.

and moral philosophy, their course is unusually full and critical. In the natural sciences, especially geology, this college is among the foremost in the land.

It has given to science the greatest geologist of the country, if not of the age, although it is difficult, in the case of Dr. Hitchcock, to tell whether the man did most to make the college, or the college the man. In fame, in good influences, and in far-reaching results, they are one and inseparable. And here we should mention, that Amherst, in common with many of the best institutions of the country, has a scientific course for those who prefer it, of four years' study, embracing all the branches of the regular college curriculum, except that other studies are substituted for the dead languages; or a partial course can be pursued subject to the control of the professors and the rules of college.

One thing we have noticed here, which constitutes a marked and most praiseworthy feature of the college. It is the special interest that the

professors take in the students, extending to their minutest wants and difficulties, and compassing their whole welfare with a sort of paternal watchfulness and kindness.

It is in such decided contrast with the dignity and reserve which the teachers in some of our colleges affect, and the distance at which they keep the students, as to be the more noticeable, and serves to make true dignity and a manly Christian courtesy appear more attractive in the face of its counterfeit.

One result of this kind and familiar treatment, is that the graduates go away regarding Amherst as indeed their *Alma Mater*, and the professors as their elder brothers; and, as we might expect, they work zealously for its prosperity and good name.

As to the decided religious atmosphere of the college, and the possible prejudice it might excite in the minds of some, we are inclined to think that the fact that the faculty are men of deep and earnest religious convictions, and that a large proportion of the students are young men of piety and sound morals and habits, will not deter judicious fathers from sending their sons here; and certainly religious parents will not think less of it on this account. Good principles and practices injure no one; corrupt ones, *may* taint and destroy not one, but many, including the most gifted and promising.

There is one important feature of this College which we have not yet mentioned, though it is of the first and last importance, and to omit which altogether would be scarcely less than criminal. We refer to its fine gymnasium and thorough system of physical training and the deservedly great importance which the faculty attach to this literally vital branch of education. In most other Colleges, it is a mere form when it is not left out altogether—a mere show of good things—and is either passed over informally, or done so much at halves as to make the whole thing a mockery and a farce. Here, on the contrary, it is no sham or make-believe, but each student is made to see and feel that it is a matter of the very highest importance. It is required of him in the weekly and daily routine as much as any branch in the College curriculum, and he is marked, in rating his standing, as fully on the gymnastic exercises as in reference to any other branch. The whole thing is under the inspection and judicious man-

agement of Professor Edward Hitchcock, a regular physician as well as teacher in the classic department, and a son of the former President. It is in good hands, and well administered. The result is plainly visible in the robust health and manly forms of the students.

This College is now amply endowed, with only the exercise of that economy which is best for the prosperity of any institution, public or private. Its buildings are twelve in number, and as a whole are convenient, attractive, and well adapted to their purposes. "Walker Hall" is the finest of them all; the College church is of a rich and elaborate style of architecture; and "Williston Hall" is a much better looking edifice that it appears to be from the engraving. The position of the artist, as is too often the case, was not the best.

The location of Amherst College for beauty, healthfulness, and safe and desirable surroundings, could hardly be improved. It is in the very garden of Massachusetts, and amid some of its most beautiful scenery, if not the most grand and picturesque. The air must be exceedingly pure, for the college buildings, in which most of the students room, are situated upon the summit of an irregular and exceedingly beautiful tract of table land, opening on every hand to the most delightful views and the freest circulation of air.

In the village and surrounding towns, drinking and the other vices, are reduced to their minimum; while most of the families in which the students board, are well-ordered and refined Christian homes. Not a few board in clubs under appropriate regulations, and thus greatly lessen their expenses.

While the teachers of this institution do not place before their pupils mere scholarship and fame as the highest motive to effort, but only as they are subordinate to principle and the good of the race, they do hold up the standard of finished and profound scholarship, and encourage by example and precept the most manly and persevering exertions for high attainments and high position. They furnish them with all the means and incentives for the most eminent success.

Hence, as we might expect, the graduates of Amherst are taking a high stand in the national councils, in the republic of letters, and in general usefulness and fame. We must remember that it is but a half century old, in making comparisons.

Among her graduates who are in political life, we may mention ex-Governor A. H. Bullock, of Massachusetts; Henry M. Spofford, Senator-elect from Louisiana; Galusha A. Grow, of Pennsylvania, formerly Speaker of the House; Horace Maynard, of Tennessee, now Minister to Turkey.

Of her eminent scholars found in almost every college and literary and scientific institution of the country, we will mention a few: the late Professor James H. Coffin, of Lafayette, a distinguished mathematician and astronomer, and author of the meteorological charts used by the Government at the different stations, whose great work on the "Law of the Winds," has just been issued by the Smithsonian Institute; Dr. Bela B. Edwards, author of several important works, and for many years a learned and eminent professor at Andover Theological Seminary; Dr. Francis A. March, Professor at Lafayette, and considered one of the greatest living philologists; and General Francis A. Walker, late of the Census and Indian Bureaus, and now Professor at Yale, who ranks high both as a scholar and a successful public man.

Among divines we may mention Rev. Henry M. Storrs, Secretary of the American Home Missionary Society, and a growing man; Dr. Roswell D. Hitchcock, of Union Theological Seminary, and a distinguished teacher and public speaker; Dr. Storrs, of Brooklyn, the eminent orator and divine; and last, but not least, Henry Ward Beecher, who, like Dr. Storrs, needs no introduction to the American people.

Of her presidents and founders, we find such names as Noah Webster, Dr. Heman Humphrey,

AGRICULTURAL COLLEGE—VIEW FROM THE WEST.

Dr. Edward Hitchcock, and the Hon. and Rev. Julius H. Seelye, the present gifted and popular incumbent of the presidential chair. President

Seelye, unlike most learned professors and savans who enter political life, has, in his congressional career, done honor to himself, his State, and the institution with which he has been so long and favorably connected. The success and *eclat* of his public life cannot but tend to draw students to Amherst College in increasing numbers.

There are many eminent scholars and public men graduates of this College whose names, at least, we should like to mention. We will only allude to Professor W. S. Tyler, an accomplished scholar and writer, and the senior Professor of the College. We do so chiefly to approve his work entitled "The History of Amherst College," and to commend his example to others. The literary and scientific world, especially the graduates of Amherst, owe him a debt of gratitude for this laborious and valuable work.

Before leaving the classic halls of Amherst, with its many interesting characteristics and associations, we will mention one or two incidents connected with the history of its greatest light and benefactor, the late illustrious President, Dr. Edward Hitchcock, who may be said almost to have created the college; or in the language of its historian, "to have saved it" from a slow death by paralysis. The Doctor, though not what is technically called a wag, had a deep vein of pleasantry and enjoyed a really good joke; and when opportunity offered was not averse to perpetrating one himself.

On one occasion, at an evening party or gathering of his friends, when the time came for refreshments, he invited them into another room, where a bountiful collation had been spread upon the *well-loaded* tables. When "all things were ready" the guests were invited to help themselves. With watering mouths they laid hold of the tempting viands; when, lo! to their great amazement, instead of bread they found a stone, and for fish, a serpent, etc. The Doctor had selected and arranged his mineral and other cabinet treasures with such ingenuity and skill in counterfeiting the various articles of food, as to make the deception complete. Of course, the friends of the witty scientist, many of whom were persons of culture, enjoyed the clever joke, as he did, hugely. But they probably concluded that when invited to a repast provided by a scientist or savan, they should be prepared for the possibility of having *scientific food* set before them.

Dr. Hitchcock was an interesting and very instructive lecturer to a select audience, but not a stirring and eloquent orator, especially before a large and promiscuous gathering.

He was addressing an assemblage of this kind in one of our cities, in an evening lecture, on his favorite theme, the "bird-tracks" in the red sandstone of the Connecticut Valley. Not being in one of his best moods, and the discourse being very lengthy, not a usual fault, we believe, with him however, it became to many of the less educated portion of the audience rather tedious, when all at once the learned speaker fired up, his face glowed with enthusiasm, his voice became strong and clear as that of a young man, and seizing a huge slab of sandstone, with the significant footmarks upon it, and slinging it upon his arm and shoulder with the strength of a Sampson, he strode across the stage, back and forth, with an air of triumph and the dignity of a prince! His tone and manner as much as said, "Open your eyes, ye stupid and sleepy souls, and behold the wonders of creation! See! Written upon this rock, as upon the ancient tables of stone, are grand eternal truths, which the Great Architect of the Universe has inscribed on them, and in the revelation of these latter days, permitted me to decipher, and you my hearers, if ye will, to see and understand. The marvelous facts written here, these 'footprints of the Creator,' though inscribed by his feathered tribes, are pregnant with great truths that are imperishable as the everlasting rocks in which they have been sealed up till this set and favored time, when God has permitted me, his unworthy servant, to break the seal, and as his mouthpiece, reveal them to you. O stupid and ungrateful ones! Could ye not look and listen for one or two short hours to such glorious ideas—to these surpassing wonders of creation?"

A wicked, waggish person remarked, at the close of the lecture, that "That stride of the learned Doctor across the stage, with the huge slab of rock on his arm, *was the most eloquent passage* in the discourse."

Having taken a look at Amherst College, its origin, characteristics, and the young men who gather there to receive a sound and symmetrical education, and having followed some of their number to the high positions which they fill in society, we will now trace them back to the preparatory course. It is like tracing the mighty

river to the rivulets and fountain-springs, that gush from the hills and mountain tops.

A goodly number have been "fitted" in the town of Amherst, some at the High School, which is kept by college graduates, and has a thorough preparatory course; and a still larger number at the "Mount Pleasant Home School for Boys," the site of which is a point whence one of the views of Amherst College was taken. This School has one of the finest locations in the country for purity of air and beauty of scenery. It has prepared over five hundred young men for college, and so thoroughly that the certificate of the Principal, Henry C. Nash, A.M., is taken at several colleges without further examination. It is said that Henry Ward Beecher, who graduated at Amherst, in 1835, fitted at this School, though it was before it came under the present management.

In the township of Amherst, about one mile from the beautiful village in which the Classical Institution is situated, the State Agricultural College of Massachusetts is located, on a farm of about two hundred and fifty acres, which is a fine site for the School and its objects. It is provided with a laboratory, hot-houses and other appliances for teaching the science and practice of farming, and the three fine buildings displayed in the cut, or, rather, two cuts, the larger one not including the hot-houses. The number of students at this time is about one hundred, and the Institution is said to be the best of the kind in the country. The President, William S. Clark, A.M., a graduate of "Amherst College," and for awhile a tutor in it, has just returned from Japan after more than a year's absence, where he went to establish similar institutions for that progressive people.

On the other side of the Connecticut River—Amherst being east of it—in sight of the College and only seven or eight miles from it, is the very important institution of Williston Seminary. It was founded in 1841, by the late Samuel Williston, a millionaire and a man distinguished for his liberal and systematic benefactions to this Seminary, Amherst College, and many of the literary and religious institutions of the county. But Williston

Seminary, situated in the village of his home and named after him, was the favorite object of his attention and benefactions. His gifts to this institution, are expected to amount in a few years to the large sum of three-fourths of a million. East Hampton, the location of the Seminary, is a place of great natural beauty, both in the village and its surroundings, and has been most extensively and tastefully improved, chiefly through the efforts of Hon. Horatio G. Knight, the present Lieutenant-Governor of the State.

AGRICULTURAL COLLEGE—VIEW FROM THE NORTHEAST.

The leading feature of this school is to fit boys—young men we will call them from their mature, manly looks, as we saw them there assembled in the chapel, a few days since, having a large sprinkling of Chinese youth among them, bright as knivel coins—thoroughly, in a four years' course of study for college. In this respect it ranks with those exceptionally good schools, Exeter and Phillips Academies. There is also a scientific course, either full or partial, for those wishing to qualify themselves for business. The present and usual number is about two hundred and fifty. At first it was open to both sexes and its numbers were considerably greater. But in 1864 it was decided to devote the institution exclusively to the training of boys.

The buildings of this Seminary, including four spacious brick edifices and among them a fine gymnasium, with its beautiful campus, make it look more like a first-class College than a Seminary; and it probably does a more thorough and important work than many institutions that go by that name. Formerly most of its graduates entered at

Amherst. Now, while a large number prefer that College, or find it more convenient, many go to Yale and other first-class colleges. Its present Principal, Mr. James M. Whiton, Ph.D., is a graduate of the last named College, an experienced teacher and thorough disciplinarian.

In a large, wealthy, and noted institution like the above, where spirited boys, and some of them "a little wild," are gathered from all parts of the Union and the world, thorough system and strict rules are necessary; and with most boys, especially, who can take life "in the rough and tumble," it is just what they need. But there is a large number of both boys and girls) every community having some and almost every family at least one) to whom this

SPRINGFIELD COLLEGIATE INSTITUTE.

rigid system becomes a yoke, and the school, if they attend such, a bondage; and worse than this, their education, and even life itself, is liable to become a failure.

In this category, we class the feeble in health, the backward, the precocious or forward, those peculiar in temperament, or mental and physical constitution. For the special benefit of such, Rev. M. C. Stebbins, A.M., a graduate of Amherst, and an experienced teacher and scholarly man, has established a school in the beautiful and flourishing city of Springfield. The school has attached to it a very large corps of teachers for the number of scholars, and hence each student can receive just the kind and amount of assistance that is needed; and the judicious hand of the Principal, with the coöperation of his numerous and able assistants, can reach the peculiar traits, wants and

difficulties of each scholar, and mould and train them for useful and happy lives. To the class we are speaking of, such an institution is a Godsend.

Yet the school is not limited to this class, but has a thorough course of study for college or for business, and a partial course for those who desire it. It was established in 1874; is for both sexes, and as an evidence of its high standing and thoroughness in the classics, we were told that its students are admitted to the leading colleges of New England, on the credentials of the Principal, no examination being required.

The building occupied is the former Court-House of Hampton County, which doubtless has a most interesting history. But we doubt if it was ever devoted to a more useful, or noble and ennobling purpose than training faithfully and successfully the boys and girls of our country for their various callings.

We should like to consider more fully the power and progress of cultivated mind from the child to the man—to trace it from its small beginnings in the quiet citizen and ripe scholar, armed with this latent strength—this inward, mighty force—that is to work out its grand results in professional or public life—as seen in the onward and upward career of a Webster, whose forensic pleas could make strong men weep like children, and stern, grave judges bow their heads like the bulrush; and whose mastery of the great principles of State and international law, command of language, and control of the reason and passions of men, could give him power to make those great arguments that shook and awed Senates, and to put forth those State papers that were more than a match for the greatest statesmen and diplomatists of Europe.

The same power that education gave to Webster it gives to all—only in less degree. Its combined strength and mighty results, as seen in communities and nations, are so marked and wonderful as to attract the attention and admiration of the most careless observer, and to prove most conclusively the great advantages and unlimited possibilities of cultured intellect. What it has done for Prussia and the United States, it would do for all nations.

And if the present confessedly imperfect system does so much for individuals and communities, what would those more perfect methods, which we ought, and doubtless shall have, universally applied, do for the race individually and for the world collectively?

## THE KING OF THE PIANOFORTE.

BY MARY GRANGER CHASE.

To Hungary belongs the honor of having given birth to the greatest of living pianists; we may add, to the greatest pianist who has ever lived. At Raiding, in that country, Franz Liszt first saw the light on the 22d of October, 1811. His father, who held some office on the estates of Prince Esterhazy, was an intimate friend of the German composer, Haydn, and was himself an amateur performer on the pianoforte and other instruments. He was the first musical instructor of his son, who, like Mozart, betrayed even in infancy that he was endowed with extraordinary gifts.

Before Franz was nine years old, he performed in a public concert in Presburg, and to the astonishment and admiration of his audience. Two Hungarian noblemen who heard him on this occasion, immediately offered to assist his father to educate him, and, with their aid, the marvelous boy was sent to Vienna, where, for eighteen months, he studied music under competent masters. The child-artist then gave a concert at Vienna, at which Beethoven was present, and he gave concerts at Munich, and elsewhere—all with great success.

When about twelve years of age, his father took him to Paris with the intention of having him pursue his studies at the Conservatory, but he was refused admission because, forsooth, he was a foreigner. His genius, however, was recognized by professional people and in the highest social circles. Little Franz was the pet and favorite of the gay metropolis, and it required no little surveillance, on the part of his proud father, to prevent his being spoilt by early admiration. Meanwhile, Franz studied counterpoint under Reicha, and practiced daily upon the pianoforte the works of some of the best composers. When this course of drilling was completed, the father and son travelled in the provinces, giving successful concerts; and, in the course of three years, Franz made three visits to England, where he was enthusiastically received.

At the age of sixteen years, Liszt lost his father, and, overwhelmed by the bereavement, fell into a morbid state of mind and feeling. An unfortunate *affaire du cœur* also distracted him from his art, and for a long while his splendid genius lay fallow.

He was aroused from this dangerous lethargy in 1831, by hearing Paganini, the peerless master of the violin, perform; and he made the resolution that he would become the Paganini of the pianoforte.

After winning no little applause at Paris, Liszt found himself eclipsed there by Thalberg, when he withdrew to Switzerland, spent some time studying in obscurity, and then, suddenly, after eight years' absence, returned to the capital of France to electrify the city. He took it completely by storm. Night after night he played alone, and would have four pianos at his service. His vigorous striking of the keys has been known to break the strings of all four in one night, and, after his performances, the ladies would press forward and beg for the broken strings, to have bracelets made of them for memorials of the *Meister*. Mendelssohn heard him play at his first concert in Paris, and remarked, as the lithe Hungarian tripped across the stage, "There's a novel apparition—the virtuoso of the nineteenth century." Mendelssohn, however, was moved to extreme admiration of the "virtuoso's" power. When Liszt played Schubert's weird poem, *Der Erlkönig*, half the people, it is said, stood on their chairs.

Since the *furor* of this appearance in Paris, Liszt's whole career has been one of continuous and dazzling triumph. He went from one European city to another, winning fresh laurels at every step. After the great inundation at Pesth, in 1838, when two thousand two hundred and eighty houses were destroyed, Liszt gave a concert at Vienna in aid of his suffering fellow-countrymen. In gratitude for this benevolence, a deputation of Hungarian noblemen waited upon him, to request him to visit Pesth, and, on his arrival there, he was welcomed with most enthusiastic demonstrations of joy, and presented by the inhabitants with a sword of honor and the citizenship of the city.

An effort was made in 1839 to erect a monument to the memory of Beethoven, at Bonn, his birthplace. After six months, the subscriptions amounted to only six hundred thalers, and about sixty thousand thalers more were needed to com-

plete the work. Liszt supplied the whole sum, and the monument was dedicated in 1845. Liszt is the fortunate possessor of the piano that Beethoven's own hands played upon, and when, in 1853, the old harpsichord that had belonged to Beethoven was offered for sale in Weimar, Liszt purchased that instrument.

In 1847, Liszt, having become satiated with the life of a wandering musician, accepted an offer from the Duke of Weimar to take the post of leader of court concerts and operas in that city, and, taking up his residence there, he has made Weimar one of the great musical centres of Europe.

In 1861 Liszt repaired to Rome, where he was most cordially received by Pius IX., who is, or at least has been, a great and appreciative lover of music, and Liszt was appointed organist in the Sistine Chapel. At the musician's own request, the Pope made him an abbé of the Roman Catholic Church, an office which does not require ecclesiastical duties of its holder, but enjoins celibacy upon him. As an abbé, Liszt has composed a great deal of church music, and has contributed very generously to charitable and religious objects, giving from out his abundance; for, during Dr. Liszt's brilliant career, fortune, as well as fame, has perpetually smiled upon the votary of art. The abbé Liszt had a villa at Rome; but, in 1871 he suddenly sold it, and returned to Hungary. In the month of November, 1873, his musical jubilee was celebrated at Pesth with great splendor; and the succeeding year, which was the fifteenth of his artistic career, he presented the museum of the grateful city of Pesth with his valuable collection of curiosities and works of art.

Dr. Liszt has done much to educate and aid other musicians. The gifted young artist, Tausig, was a great favorite with him. He bore and forbore with Tausig's erratic ways, paid his debts for him, and would say, "You'll either turn out a great blockhead, or a great master, my little Carl." He expected, indeed, that Tausig would be the inheritor of his own mastery over the pianoforte, and the younger man's death of a fever, in 1871, at Leipsic, where he had gone to meet Liszt, was a great disappointment and grief to the abbé.

Mention is often made of Liszt's pupils. In the ordinary sense of the term he does not teach at all, for he would scorn to receive remuneration from any of his scholars; but he allows artists who

evinced real musical talents to come to him at regular hours, and does, in his own sovereign way, give them instruction. An American young lady who was one of these favored pupils in 1873, has published parts of her home letters written at the time. She says of the great master:

"He is the most interesting and striking-looking man imaginable—tall and slight, with deep-set eyes, shaggy eyebrows, and long iron-gray hair, which he wears parted in the middle. His mouth turns up at the corners, which gives him a most crafty and Mephistophelean expression when he smiles, and his whole appearance and manner have a sort of jesuitical elegance and ease. His hands are very narrow, with long and slender fingers that look as if they had twice as many points as other peoples'. They are so flexible and supple that it makes you nervous to look at them. Anything like the polish of his manner I never saw. . . . When he walks out in Weimar he bows to everybody just like a king! The Grand Duke has presented him with a house beautifully situated on the park, and here he lives elegantly, free of expense, whenever he chooses to come to it. . . . I am at that summit of my ambition—to be *his* pupil! He is so overrun with people that I think it a wonder he is civil to anybody, but he is the most amiable man I ever knew, though he *can* be dreadful-too, when he chooses, and he understands how to put people outside his door in as short a space of time as it can be done. I go to him three times a week.

"At home Liszt doesn't wear his long abbé's coat, but a short one, in which he looks much more artistic. It is *so* delicious in that room of his! It was all furnished and put in order for him by the Grand Duchess herself. The walls are pale-gray, with a gilded border running round the room, or rather, two rooms, which are divided, but not separated, by crimson curtains. The furniture is crimson, and everything is so *comfortable*; such a contrast to German laziness and stiffness generally. A splendid grand piano stands in one window (he receives a new one every year). The other window is always wide open, and looks out on the park. There is a dovecote just opposite the window, and the doves promenade up and down on the roof of it, and fly about, and sometimes whirl down on the sill itself. That pleases Liszt. There is a carpet on the floor, a rarity in Germany, and Liszt generally walks about, and smokes, and mut-

ters (he can never be said to talk), and calls upon one or other of us to play. From time to time he will sit down and play himself, where a passage does not suit him, and when he is in good spirits he makes little jests all the time. His playing was a complete revelation to me, and has given me an entirely new insight into music. I've begun to study now in an entirely new way, and I feel that every time I go to him it is worth a thousand dollars to me.

"But Liszt is not at all like a master, and cannot be treated like one. He is a monarch, and when he extends his royal sceptre you can sit down and play to him. You never can ask him to play anything for you, no matter how much you're dying to hear it. If he is in the mood he will play; if not, you must content yourself with a few remarks. You cannot even offer to play yourself. You lay your notes on the table, so that he can see that you *want* to play, and sit down. He takes a turn up and down the room, looks at the music, and if the piece interests him, he will call upon you. We bring the same piece to him but once, and but once play it through."

Another American writes, perhaps somewhat later: "A few days later I reached Weimar. The place has almost become a Mecca to American travellers, for beneath the sod of the cemetery lie the bodies of Goethe and Schiller. On inquiring for Liszt's house I was directed to a point on a hillside high above the city, where a house was perched upon an apparently inaccessible precipice. In a few minutes the door opened, and I stood in the presence of the man who had talked with Beethoven, and was then considered the greatest musical genius of his age. A long, clean-shaven, massive face, with clear-cut features and prominent chin, framed in long, flowing dark hair, his gray eyes full of fire; his dress was a long, closely-buttoned black coat, showing a symmetrical figure of medium height, with small and well-shaped hands and feet. A pleasant smile lit up his face as he advanced, shook hands, and bade me welcome to the Eagle's Nest, as he called his home. We sat and talked on various subjects, on all of which he was possessed of considerable information, showing that he had been a close observer of men and things. He asked a great many things about America, and then I inquired why he did not visit us. He shrugged his shoulders, and said he was getting too old to think of visiting a New World.

Then he courteously asked me if I would like to hear him play. 'Of course I would.' He sat down to the piano and played one of his own sonatas, after which he extemporized, producing some startling effects upon the instrument.

"He then insisted upon my playing, and would take no excuse; so I, perforce, sat down in some trepidation; but the first chord I struck produced no tone. I tried again with a not much better result. Then I heard him quietly laughing, and, turning around, I saw the joke. I had been trying to play on the famous Tomascheck piano, which was made for him as a practicing instrument, and on which the touch is so heavy that an ordinary player can scarcely produce a sound from it; yet he plays the most delicate *pianissimo* passages upon it with apparent ease.

"'I will show you my Erard,' said he, 'if you will follow me.' We ascended to the next floor, where there were two large rooms connected by folding-doors. The one was his dining-room, the other an extension parlor, luxuriously furnished, and containing the famous 'Erard Grand,' presented to him by the makers. It is in this room that the delightful musical reunions take place, in several of which I had the pleasure of sharing. These informal meetings take place frequently, and all who have an earnest love for the art, no matter of what station or nationality, could easily obtain an *entrée*; but the host has a thorough contempt for curiosity mongers, who come merely to stare at him, to be able to say they 'have seen Liszt.'

"On the third floor of the house, where Liszt does most of his work, and where his musical library is stored, there is in one room a piano and organ combined, so that he can play on both at once. And with these two instruments he produces the most novel and beautiful effects. Another room contains his relics and curiosities, some of which he holds almost in veneration. Chief among them was Beethoven's piano—the instrument upon which the great master had played. Another was Mozart's spinet, in which the tones were produced by the twitching of the wire with a piece of quill, a key-board similar to the present one producing the movement."

Apocryphal to the acknowledged impropriety of any one's asking Liszt to play, we have met with the following story: "One lady of rank, at whose house he was spending the evening, committed the

extreme indiscretion of asking him to play, a violation of all rules of etiquette among great musical artists. He had been enchanting the guests with his divine music in the earlier part of the evening, and had just come in from supper, when she preferred her request. 'Madame, j'ai mangé très peu,' was his answer (madam, I have eaten very little); and with this implication of having played out the worth of his supper, he left the house."

Liszt makes no affectation of ignorance concerning his own superiority. It is related that many years ago, a lady asked him whom he considered the greatest living pianist? "Thalberg," was his immediate reply. "But," continued his questioner, "do you consider him superior to yourself?" "Madam," he rejoined, "I had no idea you made any reference to me; I stand too high to be compared to ordinary pianists."

Liszt is not only the marvel of the musical world as a performer, but he has written hundreds of compositions, working in almost every department of music. He has also set to music the songs of Goethe and other poets, especially excelling with those of Victor Hugo; and he has been a great song-maker himself. Nor has his authorship been limited to these productions, for he

wrote, *con amore*, the "Life of Chopin," the gifted Polish composer; and, also, "The Gypsies and their Music," which was published in Paris in 1859.

Chopin delighted in hearing his compositions rendered by Liszt's masterhand. The two men were greatly attached to each other, and one of Liszt's pupils relates that in a private talk with the abbé, he said, "that when he and Chopin were young together, somebody told him that Chopin had a remarkable talent for mimicry, and so he said to Chopin, 'Come round to my rooms this evening, and show off this talent of yours.' So Chopin came; he had purchased a blonde wig ('I was very blonde at that time,' said Liszt), which he put on, and got himself up in one of Liszt's suits. Presently an acquaintance of Liszt's came in; Chopin went to meet him instead of Liszt, and took off his voice and manner so perfectly that the man actually mistook him for Liszt, and made an appointment with him for the next day; 'and there I was in the room,' said Liszt. 'Wasn't that remarkable?'"

It has been said, "Hear Liszt, and die!" but, far more wisely from every point of view, "Hear Liszt, understand him, and live!"

## OUT OF WORK.

BY MRS. HARRIET M. SMITH.

### IN TWO PARTS.—PART I.

A PLEASANT cottage on a pleasant street of a thriving manufacturing town in Massachusetts. Everything about it in apple-pie order; from the well-swept walks, the clean back piazza, where some fat pumpkins and squashes were ripening in the sun, to the comfortable kitchen and neat housewife, who was deftly spreading the tea-table, while answering the question her daughter Lucy had addressed to her, as to whether father would have the new melodeon brought home that night.

"And I," said Bennie, a lad of eight years, "want my new jacket; just look at this old thing!" and he held up a ragged cuff to view.

"Yes, Bennie, you shall have your new suit soon, and I should not be surprised if father had the melodeon brought to-night, Lucy. Here he

comes now," she added, glancing out the window, "but no melodeon; probably will have it sent up in the morning. Set up the tea, Lucy, it's late."

"Why, how slow you come, pa!" called out the boy, as he swung open the door and ran down the walk, laughingly adding as he opened the gate, "Got the rocks?" for that had been pay-day at the shop where Mr. Green worked.

A damper fell on the boy's joyousness, as his eyes met the grave face of his father, who took his hand without replying, and came slowly up the walk, looking sadly all about the little place as he did so.

The little kitchen, with all its usual brightness and the appetizingly spread tea-table, met him as he passed in.

"Come, father, I've some extra biscuits to-night, and—" but Mrs. Green started as she glanced at her husband, as he seated himself, without a word, at the table.

"Tired, father?" said Lucy.

"A little," he answered, as he took his tea.

"Anything gone wrong at the shop?" inquired his wife.

"No, but they've shut all down to-night, and will not open before next April."

"Shut down?" and Mrs. Green dropped her knife and sank back with a sudden pallor on her face. "Why, they've said nothing about it before, have they?"

"No; but the failure of that house in New York that sent such large orders, and that owe for the last six months' work, has crippled them so that they will not be able to go on at present, and here are sixty men thrown out of work these times, just as winter is upon us," and Mr. Green leaned his head on his hand, and seemed unable to swallow his food.

The quick tears had sprung to Lucy's eyes as the announcement was made, to be as hastily brushed away, as she silently gave up the coveted melodeon, for Lucy was a sweet singer, and longed to perfect herself in music.

Brave Bennie, though with a child's disappointment he had said, "then I shall have to wait for my new suit," quickly added, as his father's head went down, "but I can wear this a little longer; I shall put on my overcoat soon, and that will hide the rags."

"Never you fear, Bennie," said his mother, "you shall not go in rags, so don't borrow trouble; we'll manage somehow."

"Mr. Stone told me to-day, father, that if I passed examination, I should have the school next term," said Lucy.

"Did he?" and a little of the care lifted from the brow of Mr. Green at the cheerful words of those who loved him.

"But you are too young, child," he answered, "to be confined to teaching; I'm afraid you can't endure it."

"Yes, indeed, father, I can, and I mean to get the school too."

"And we'll take Sears to board," said mother; "you know he's been teasing us ever so long for our parlor, because it's so sunny. He met me on the street to-day, and offered me ten dollars a

week if I would let him have it, with board. Hadn't we better send him word this evening that he may take it?"

"I suppose we shall have to, but I hate to have my home invaded by strangers, and the cross, crotchety one he is; I'm afraid you'll get sick of it."

"We will try it, at least." And so it was decided, with many misgivings, that Bennie should carry a note in Lucy's neat hand to the rich old bachelor at the hotel, saying that he could have board with them as soon as he wished. The answer came, "he would take possession of the parlor on the morrow;" so said Bennie, as he rushed into the house with all a boy's uproar, and shouted out, "only think, mother, Mrs. Wade stopped me as I came by, and said she wanted a boy to pick her apples and pears, and asked if I wanted the job? Guess I said yes quick enough, for Jim Thompson said she paid him well last year; I'll bet I'll earn enough for my new suit," and with a twirl of his cap, it lighted on Lucy's head, and a laugh went around the circle at the boy's enthusiasm.

Mr. Green had worked hard and long, assisted by the economy and thrift of his wife, to get his little home; he had partly paid for it, and given a mortgage for the balance, to one of the hardest men in all B—. Had his work continued, he would slowly have paid it off, but that had given out, winter was close at hand, fuel to be laid in, some necessary repairs to be done to the house, and only his last month's pay to meet it all with.

But we have seen how nobly the dear ones at home met the emergency; and though early on the morrow they proceeded to carry off the pretty parlor furniture to the attic, spread a drugget over the new carpet, and arranged the chamber-set from the spare room in it, they all worked with rather heavy hearts, albeit the voices of Mrs. Green and Lucy were gay and cheerful, that father might not think they regretted it too much.

"No, father," his wife had said, as they talked it over the night before, after the children had retired; "we'll hold on to our home. Some way will be provided to meet the mortgage."

"But, mother, are you going to be able to do the work if Lucy takes the school? You know you have not been strong since that sickness."

"Oh, she can help a good deal out of school; and, then, Bennie can run all the errands; and

here's yourself—what are you going to do but play hired-girl, and do the *hard* work, that is, if you don't get employment anywhere?"

"Sure enough," and with a smile she had succeeded in bringing to his face, they retired to rest, thankful for the oneness of heart, at least, of their family. Yet Mr. Green thought long after retiring of the uncertainty of the future.

"Out of work!" How little can any one who has never depended on the labor of his hands for the support of himself and family reckon of the ominous meaning of those words—words that are mournfully ringing all over our land to-day!

The withered old bachelor of sixty appeared promptly with a truckman, bringing his trunks, books and pictures by the time the room was in order. And it must be confessed, a sad tremor ran through the family at the thump of his cane, as he limped through the hall, and took his place at the dinner-table.

Poor, crusty old John Sears! Few liked him, or would have tolerated him a moment had it not been for his wealth. An early disappointment had soured him against all womankind; he had outlived all his family, as he supposed, and had devoted the whole of his life to the amassing of money. A few hundreds inherited from his father he had invested in a cotton-mill of B—, and with untiring industry and sagacity, he had seen it slowly accumulating, until, at last, he became owner of mill after mill, and at the period of our story owned half the houses in B—.

"Well," he said, shortly, as he unfolded his napkin and glanced around on the family, "I don't see as you've any reason to complain, if work has stopped. Got a comfortable place here."

"Yes, if I can keep it, Mr. Sears. You know I've a mortgage on it."

"Keep it—of course you will. So, don't talk nonsense, Green."

Knowing his ways, Mr. Green turned the conversation, and presently the boarder went to his room, which a bright fire in the shining stove had made comfortable, for the evenings were beginning to be chilly.

Most men would have thanked Mrs. Green as she drew up to it a nice large stuffed rocker, that she had robbed herself of from the sitting-room, saying: "I thought you might like this chair; it is one my father used to sit in after his rheumatism got so bad, and said it felt easier than any other one to him."

But he only settled himself in it with a groan, and abruptly asked her the breakfast hour. "Seven," she told him, and retired to her own apartments.

Now, it was not that John Sears was ungrateful to Mrs. Green; but he had been so long used to being served for his money alone as to not expect kindness and consideration, and was therefore so surprised and touched with it as to feel a strange choking in his throat, and rather than betray any feeling, kept silence. People did not read rightly the closed book of the cynical old bachelor's heart.

Lucy had secured the school, and bid fair to excel as a teacher. She was a bright, healthy girl of seventeen, full of enthusiasm and with a great taste for music. And though she did often have a headache as the coveted instrument seemed farther and farther off, yet her voice never betrayed it as she poured it out in the choir on the Sabbath, or caroled her songs about the house.

Mr. Green had failed to find work in B—, or in any of the towns about them, and had to content himself with making all the improvements about the cottage, and in being "hired girl." But, strong and well, he felt keenly, as so many all over the land do to-day, the inactivity of his life. He fretted under the petty exactions of their rich boarder. It was misery to him to see their happy circle invaded by strangers, for Mrs. Green had fitted up the spare chamber with articles from their own rooms, and taken the new high-school teacher to board; and to see his darling Lucy, after teaching all day, have to come home and assist about the sewing instead of being out in the exhilarating air with her associates, was bitterness to the doting father, and many a time he would have given up in discouragement had not he seen the cheerful courage of his good little wife, who preached, "Patience, father; when work starts up at the shop, we'll have back the parlor, and Lucy shall have her melodeon in it, too."

January was nearly through, when one night Mr. Green said to his wife, after all, as he supposed, had retired: "What are we to do? The first of next month the money is due on the mortgage, and old Mills, if it is not forthcoming, will foreclose, as he did on Talbot. The board money will not much more than meet the expenses of the month, for you know we had to get coal, which is an extra. I would ask an advance of board of Sears, but I hate to; and then it would only be staving off this month to be met another."

"But we can't give up our home, father, and if Mr. Sears will advance a part of next month's board, there'll be Lucy's pay coming at the end of the month; and then there's those expensive ear-rings Robert sent me, I shall never wear them, they are not suitable in our circumstances, and as to Lucy ever wearing ear-rings, I don't wish to see my child copying an Indian squaw. I'll see if Mrs. Bond will do as she said when she saw them, 'give me any price I'd name,' if I'd sell them to her. Shouldn't you think they'd bring twelve or fifteen dollars?"

"What will your brother say to your selling them?"

"Robert will be glad under the circumstances, for he hates debts, and would not like us to contract them."

"Well, I suppose I must ask an advance, but I hate to," and a long sigh followed the words.

Just then the cars thundered past, and under cover of their noise Mr. Sears crept off the lounge behind the door of the sitting-room, where he had thrown himself after leaving the supper-table, and as none of the family had happened to pass through the room since, he had lain there dozing, until the voices in the kitchen had aroused him, and hearing his name, his curiosity was aroused to know what was said. So he had learned all about the perplexities of the Greens now, and as he slowly undressed, his face worked in an unusual manner. Occasionally his head would give a decided jerk, and his hand come down on the table, as though an inward resolve had been taken. As he snuggled down in his blankets, he chuckled out, "ask an advance on board, will you, Green? Sell your ear-rings, will you, woman? Take all that gal's hard earnings? not if my name's John Sears." The thought of what he could, and *would* do, kept the old man awake for an hour, until at last he lay in a quiet sleep, and if good angels prompt to good deeds, they must have been pretty near old John that night.

"You are up early, Mr. Sears, this morning," said Mrs. Green, as he came into the kitchen a half hour before breakfast next morning.

"My fire won't work," said he, as he hovered about the stove rubbing his chilled hands.

She drew a chair for him, saying, "Sit right down and get warm; Mr. Green will see what ails it after breakfast."

He watched furtively the brisk little woman as

she set out the breakfast, called the children, and placed his chair at the table. When the meal was over, Lucy gone up to her chamber-work, Bennie to his chores in the shed, he said to Mr. Green, "Step into my room, will you, and see what ails my stove."

Mr. Green followed him, and looked it over. "Oh, I see, look here, you didn't open this damper," giving it a push that started the fire roaring up the chimney.

"Sure enough; I'll remember it next time," said artful old John, who had purposely left it as an excuse to get him in without his mistrusting anything.

"See here, Green," he said, as he turned to go out of the room, "here's some money I've had paid in lately, that I don't care to invest these times, and don't want lying around; as you are out of work, can't you find a use for it? You can take your own time to pay it in, and I'll warrant you I'll take no interest," and he held out two fifty dollar notes.

Did Mr. Green hear aright, Miser Sears, as he was called, saying this? He was too much surprised to answer, but at length said: "Thank you a thousand times, Mr. Sears, your money comes in just the right time," and then told him of the mortgage.

"Well then you'll be ready for old Mills now, so go along. But hold on a minute, I forgot, here's a little parcel for your wife; I notice my mending is always done when the clothes come from the wash, that's something I can't allow without compensation."

"As to that, sir, my wife wishes nothing I'm sure, and you are already too kind."

"No more words, sir, take this to her," and he fairly pushed Mr. Green out, and shut the door on him, for the old man's eyes were filling with tears of satisfaction, and he was not going to be seen making a baby of himself. He had it out alone, that unwonted tenderness, and was a better man for it too.

Out in the kitchen was a joyful little group, gathered about father, as he showed the notes and opened the parcel, in which lay a five dollar bill and a handsome brooch for the "girl."

"And that's me," said Lucy, as she adjusted it in her collar, and danced up to the mirror.

"What good taste he has shown, too," said Mrs. Green; "no tawdry thing, but that coral rose, with a real expensive setting."

So the money was paid in on the mortgage the first of the month, and the family breathed freely. How the chilled heart of the old man opened to the warmth of gratitude, the family vied with each other to show him. And how richly was the patient wife rewarded for all her long-suffering.

It had been hard for a mother to hear her only son called a "noisy cub," if he moved out of a walk; to have him continually called upon to do little things for the comfort of the man who never thanked him, but snubbed him on all occasions. Hard for her to spend the Sabbath forenoon in getting up a nice hot dinner, when a lunch had always sufficed them, and left her rested enough to attend church. Hard to exert herself in getting up some delicacy to please his fastidious appetite, and hear him gruffly decline, with "I never eat such trash."

Better rewarded still was she one day, to hear him saying to her husband in the shed:

"That wife of yours, Green, is one of a thousand. How I've tried ever since I've been here to get her temper raised, and she's kept it all the time, and I'm a good-for-nothing nuisance for my pains. And I say, Green, you are a man to be envied, not that I wan't any man's wife; I'm quite content to be her boarder."

One bright morning in February, Mr. Green said to Lucy, whose vacation was nearly over, "Don't you want to take a ride with me to-day? I'm going down to J—to collect that bill of Jones, and, come, what says mother?" turning to her.

"I say go right up and get ready Lucy, you need the change and ride, for you are losing your color fast."

"I can afford to lose some of it," said the laughing girl, as she flew off up stairs.

In less than half an hour she was back, cheeks and eyes radiant, dressed in her pretty brown suit, with a warm shawl over her arm, the jaunty velvet hat with its drooping plume resting lightly on the glossy curls, knotted back with a scarlet ribbon.

It was a twelve mile ride on the cars to J—, and they were soon whirling along their journey through the crisp winter air. Mrs. Green turned to her ironing-table with a strange mixture of sad and joyous feeling, for one so usually light-hearted. She was glad to have them take this little recreation, but there seemed a foreboding in her heart, and long before the hour the train was due in the

afternoon, she began to look up the road for the cars.

The travellers meanwhile had arrived at J—, and after getting well warmed at the stove of the station, Mr. Green had bought at the periodical counter a magazine for Lucy to read, while he hunted up his debtor. He found him, got his money, and after partaking of a nice dinner, stood at the window of the station waiting the up train, that in a few minutes rushed up, halted, took on its load, and sped away.

Just in front of Lucy and her father, a young man, apparently twenty years or thereabouts, bronzed with travel, but of a fine, open countenance, with a tall, well-knit frame and most winning blue eyes, took his seat. He seemed to scrutinize the country through which they passed closely, and as they neared B—, and passed a large factory, he turned to Mr. Green and asked, "Are we near B—?"

"Yes," said Mr. Green, "we are nearly to the last station before entering it. You are a stranger in these parts?"

"Yes, I never was here before, but B— was my mother's birthplace, and it possesses an interest for me."

"Then your mother is not living?"

"No, my parents both died in California when I was a lad of fourteen."

"Have you no relations living in B—?"

"I had an uncle, a brother of my mother's, living here at the time of her death, but as he never answered the letter I wrote him at that time, I suppose he may be dead or gone away. He might, however, have cherished his anger against the child as he did its mother, for he never forgave my mother for marrying my father, and so no intercourse was kept up between them."

"What was your uncle's name, sir?"

"John Sears."

"Why, then I'm glad to say he's living, and boarding with me at this time."

"Is it possible," said the young stranger, and his face flushed, and he made minute inquiries as to his looks, character, etc., to all of which Mr. Green returned answers, softening down as much as possible the truth as to his churlishness, and ending with, "Your uncle is a very rich man, I can tell you."

"Glad to hear it; I supposed as much from what my mother has told me."

## MINNESOTA, OR THE LAND OF LAKES.

BY MARTHA CORNELL WOODWARD.

## II.

THE HUNTER'S PRIZE.

## CHAPTER V.

DUST on thy mantle! dust,  
 Bright summer, on thy livery of green!  
 A tarnish, as of rust,  
 Dims thy late brilliant sheen;  
 And thy young glories—leaf, and bud, and flower—  
 Change cometh over them with every hour.

Midsummer dullness has overtaken us at Clear Lake. Several good reasons might be given, if one chose, aside from the warmth of the atmosphere, which really is not objectionable, from the fact of its accompanying purity and healthfulness, as also, the amount of air each person feels entitled to. One becomes ambitious of space here in Minnesota, and reaches out indefinitely, feeling a capacity to clasp the world.

I see by the map that a good deal of unoccupied soil lies due north, over whose solitudes fresh, unpolluted breezes greet us. Breezes which sweep down from the North Pole over unknown regions of territory; fanning the cheek of the Indian

maiden to fresher bloom, and awakening, with vigorous breath, the peaceful waters of lakes and streams. It is not so much the atmosphere by which we are disturbed, as it is some gaseous poison accompanying it; perhaps a taint wafted from fields of Northern bloodshed. One scarcely understands the subtleties of antagonistic influences.

The Professor is very decided, and towers above us like a giant. I think that he is destined for the Presidency, at least. One hardly ventures an opinion upon matters of positive knowledge and experience, without fearing that some famous German thinker, in emphatic tones, will be brought to the surface, as authority against it—as if since early youth, we have regarded these authorities in the least; though it would be impossible to impress him with the knowledge that it is not the veriest ignorance in us, instead of the highest wisdom, that we have come to regard ourselves as authority for ourselves.

It is wonderful how much this young man has

to learn. One's sense of superiority becomes almost dazzling when, judged from his standpoint, one's own progress is contemplated. Though

TEAL DUCKS.

sadly we have to acknowledge that he disregards our deepest experiences, and turns with contemptuous smile from our counsels. He takes for granted that there must be outward demonstration of inward struggle, not having yet learned, that for the deadliest wrongs there must be no complaint, if we would escape the contempt and pity of the world; and that silent endurance, and heavenly forgiveness, are the only weapons with which life's battles must be fought. Thus, he misunderstands the grand success of our lives—this flippant youth. One might almost imagine from the fact that Adam accepted the apple from Eve's hand, that man's superiority is not so much a natural endowment, as an accidental growth of questionable authority!

Truly our lives are becoming rounded by gossip in these midsummer days. Charley brought news from the station that two men, named Cameron, have bought land upon the prairie within a mile of us, and furthermore, that they have the reputation of being horse thieves. This is startling news in a neighborhood where no lawyer has ever yet found material of cobweb consistency in which to entangle the brains of this honest people, and where doors remain always upon the latch. It is evident that civilization is making rapid strides, and that soon law will go about like a roaring lion, in place of rollicking at ease in shaded bowers. Alas, for these fleeting happy days! Alas, for the days to come!

We have made a pilgrimage to the Tamarack swamp, four miles distant. We started upon a pleasant Sunday morning, a full load of worshippers—"who through nature, looked up to nature's God"—well packed in the lumber wagon. The Professor was in high spirits. Pointing to the wild roses over which we drove—prairie fires keeping them reduced to the merest twigs of roses—he sang in good voice, "'Twas the last rose of summer," which was a brilliant witticism in the light of a pleasant summer morning; only later in the day, it would have savored of the vapid. An occasional oasis of meadow land was readily recognized in the midst of these sterile plains. Josh Briggs, mounted upon his "foaming steed," was seen dashing among the bushes in the endeavor to secure some dozen or more horses, most of them Indian ponies accustomed to roam at large, and glean off prairie verdure. The effect was enlivening. Josh rode like a Mexican ranger, eliciting our entire admiration. He bore himself with the unconscious grace of a true child of nature.

We stopped to refresh the horses at a deep, narrow stream almost hidden in wild luxuriant grass, lying like a vein of turgid blood, in immediate contact with thin sterile soil. These striking contrasts, everywhere visible on Minnesota soil, evince facts of volcanic disruption at some stage of the world beyond the ken of historic knowledge. The Professor gathered lilies of peculiar size and form-

THE PRAIRIE HAWK.

ation, with which we adorned ourselves in gorgeous array.

Presently the Tamarack swamp became visible-

to the eye in scraggy, turret-like shapes. These trees make durable fencing material, as well as the best of firewood. They looked in the distance like so many arrow-heads pointing toward the sky. It is not improbable that these very trees presented models to the Indian brain from which their native warlike implements were copied. We secured the horses under the shade of scrub-oaks, where too, we left all dispensable articles, and in heavy boots entered the swamp, stumbling over logs, and sink-

of science.) But most remarkable was the pitcher plant, of similar growth, though of greater solidity, presenting large clumps of pitcher-shaped leaves, with capacity for holding a half cup of water each, furnishing complete toilet-sets, one might imagine, for fairy use. We started home laden with these woody treasures, again meeting Josh, in Sunday apparel, sleek and trim, demurely riding towards St. Francis. But Josh, Josh, you were shorn of your glory! One never could have supposed

OUT ON THE PRAIRIE.

ing to our boot-tops in rank vegetation. Hanging moss draped in petrified stiffness the dead trees, upon whose dismantled branches lichens had accumulated in varied colored representations of nature's handiwork. The dense woods were full of these trees, which in the order of nature have been crowded off the stage, and stand in dreary isolation, clothed in the hoary drapery of the ages.

Wonders met us at every toilsome footstep. Moccasin flowers, growing large as lilies, were of a delicate pinkish purple, and looked fresh as if grown in Eden. Indian pipes, a species of fungus growth, were found in these damp, humid depths. We examined them with interest, as undoubtedly, also, presenting models for the common pipe. (One instinctively makes suggestions in the cause

the dashing lasso rider and the nondescript fine gentleman one and the same.

Those Camerons have commenced breaking ground, we hear. That these men are of plebeian extraction could scarcely be doubted, aside from unfortunate rumors afloat regarding their antecedents, the distinctions which mark society here, as in populated towns, being greatly dependent upon locality. To be considered of the aristocracy, a lake and a road must be included in one's possessions. People must be able to say: "That is Mr. Thomas's road," or, "Mr. Jones's lake;" and that these Camerons have settled down flat upon the prairie, without water facilities even, bodes ill of their respectability.

These patrician domains, however, from a prac-

tical view, are found to be composed in a large degree of "airy nothings." There is fishing and hunting, space and air, and there the story ends. Then comes the "winter of their discontent," which literally continues from October to June. The well-to-do grocer over the river confided to me the fact of it being "very tame." "Oh, yes," he said, "people were decoyed by stories of hunting and fishing, but"—with a tremulous motion of his broad-brimmed straw hat, and a long-drawn sigh, indicative of the nothingness of

glorious summer the remembrance would haunt the soul with dreariness.

Another phase of winter life is to be in the excitement of battle in a cold climate, braced up by pure, exhilarating paths of drifting snow, and the elements within garments, to the rule of grace and symmetry, so that one's spirits rise to these agencies, and sparkle and scintillate in the winter in coruscations of light.

WESTERN LIFE AND ADVENTURE.

Minnesota life, he resumed his usual placid demeanor, leaving me to draw my own conclusions from the pathos of his unfinished sentence.

I can imagine that a winter spent in these solitudes of space, and in the monotony of its hundred and thirty degrees of atmosphere, would prove the grave of one's aspirations; that the eternal rising and setting of the sun, which day by day greets the eye, as it is said, in cloudless splendor, would glare upon one's sight with chill, glassy steadfastness through the leafless trees, and over the awful space, until the tension of one's senses became strung to ethereal susceptibilities, and that the tardy spring would open upon a company of spirits disembodied. I can imagine that all through the

spring dawns, lo! a race of Phases of Minnesota life are in various circumstances. But I think it must be tame year in and year out, or lightful it may be through time.

On going to the barn this morning, I found workmen unloading hay, and I, too, an adventure, drove back with a load of hay, and rode in upon a load of hay, how near I had come to forgetting the highly-becoming country pastures, favored me, however, and my tastes was saved just in time to be with a view to your instruction.

examine the soil and quality of grass while waiting for the team. And if you have formed any poetical ideas of meadow-land in Minnesota, you will be surprised to learn that it greatly resembles a marsh, and that its surface is covered with a slimy moss which sinks with every footstep. Also, that the grass is coarse and stiff; when cut emitting a rank odor very unlike the delicate perfume of hay in more genial climes. It is well named bottom-land, and in this locality borders the slough, a rambling outlet from the lake.

I glean various ideas about farming from Charley. He is not much of a talker, it is true; but what he does say is to the point, and, furthermore, I like his companionship; he is a sympathetic listener, that rarest of accomplishments. A good listener is indeed a *rara avis*. There is the well-bred listener, the subservient listener; there is the listener who, with heart in his throat, awaiteth his doom. But most detestable is the listener who, with ill-repressed eagerness, awaits a pause in order to commence himself; these last, unhappily, being most numerous. But Charley is not egotistical. It is wonderful what a charm lies in this simply negative quality. With quick, sensitive perceptions, he understands one's honesty of motive as well as speech, and pleasantly assents by an appreciative smile and glance of recognition. On the contrary, the Professor is always belligerent. With opportunities of culture, he yet understands nothing but facts drawn from pure mathematical experiment. So far as metaphysics is concerned, he has given us to understand that he reached the ultimatum of that philosophy while at college, thus cutting off argument in that direction. Truly, one's only refuge is silence when the Professor opens his lips, in view of which one's sense of superiority rises to the sublime.

The birds, too, have lapsed from their high estate of sylvan songsters to the position of domestic drudges, occupying themselves almost exclusively in training their young. I notice newly-fledged younglings trying their wings among the branches, or helplessly fluttering upon the green sward beneath. There are sociable, clucking

sounds proceeding from nests and secret places hidden among the leaves, indicative of domestic exclusiveness. But the grand, triumphant melody of early summer is superseded by dismal cries of the loon from over the water. If one happens to be wakeful, he will be very likely to hear lonesome sounds like these breaking upon the stillness of night, varied by the song of the whip-poor-will,

SCENE NEAR LAKE PEPIN.

which continues on till the early morning. Keeping unwilling vigils at this hour, I have noticed either that he becomes weary of his own monotony, or from some cause demoralized, and that his song is but indifferently rendered; the clear, liquid tones of his voice, noticeable in the early evening, becoming slurred and inarticulate in the dawning light. Can it be possible that these birds are bacchanals, and that they imbibe of ambrosial dewdrops, until, with heavy heads and maudlin brains, they sink to lethargic repose?

Basking in this meridian splendor, we have of late somewhat affected the social haunts of plea-

sure. One unhappy, fateful evening we attended a ball, which took place at the Town Hall. This edifice is a small two-story house occupying a prominent position upon a prairie, comprising within its limits fifteen hundred acres of ground. It is a building of singular primitiveness of construction. Everything of importance transpires at this place, hence the dance. Narrow board seats were provided for the occupancy of "wall flowers," at each end of the room, which I can safely say, so far as regards myself, were far from luxurious places of repose upon a long stretch. From a retrospective view, I can but conclude, that strength and endurance were gifts bestowed upon us through the agency of miraculous powers, preserving our bodies and spirits intact through the evening's trying ordeal. Also, our return through the dark lowery night, was a performance dependent entirely upon animal instinct. The Professor held the reins it was true, but of what avail was theoretical knowledge, or schools and colleges, with outward vision befogged in darkness so profound? In this emergency, without doubt, the superiority of instinct over reason was a significant fact, and that our lives were preserved awakened feelings of gratitude.

Ah! Aunt Dee, why not be content with the dancing sunlight, the music of the waves, and the poetry of woods and glades; to the exclusion of the terrible dangers and realities incidental to social intercourse!

In these latter summer days, we have explored villages and towns, driving through the freshening breeze, over inevitable prairie grounds, miles and miles away. St. Cloud is a place of prominence in this part of the world, lying twelve miles north, on the opposite side of the Mississippi. It is a flourishing town of three thousand inhabitants. Two miles up the river is situated Sank Rapids, said to be a place of resort, though as we learned, not a single resorter had thus far been attracted by its beauties. Judging from accommodations which the hotel had to offer, we should infer that resorting must have gone out of fashion at this place. Crossing the ferry from above, we drove toward St. Cloud upon the opposite side of the river, and were well pleased with a fine view of the "Rapids," presented from its banks.

Golden-rod and purple thistle cover the plains; bright-red among the leaves of the sumach grow more vivid with every passing day. It is plain

that we are upon the downward path of summer's glory; while yet with strange tenacity we linger beneath the quiet shades, and muse besides the murmuring waves.

The lotus blooms below the barren peak,  
The lotus blows by every winding creek;  
All day the wind breathes low with mellow tone;  
Thro' every hollow cave and alley lone,  
Round and round the spicy downs  
The yellow lotus dust is blown.

#### CHAPTER VI.

Up comrades, up! the mead lark's note  
And the plover's cry o'er the prairie float;  
The squirrel, he springs from his covert now,  
To prank it away on the chestnut bough,  
Where the oriole's pendant nest, high up,  
Is rocked on the swaying trees,  
While the hum bird sips from the harebell's cup,  
As it bends to the morning breeze.—HOFFMAN.

The soft breath of silence rested upon wood and plain, when Ben and Anne Briggs came rowing over the lake by the light of the moon. They emerged from among the shadows of the trees into the broader light, in ghostly semblance of "Apollo conducting the water-draped Undine to shore." Something awkwardly carried under Ben's arm attracted our attention, which proved to be a violin. With kind consideration for our entertainment, he had brought this instrument with which to ravish our senses in sweet music's melodies. It was a delicate attention on his part, certainly, though of doubtful expediency, and demanding reservations in modes of administration, which became apparent at the first grating sound of the bow across the strings, when with instincts of safety, we sought refuge in distant recesses beneath the sheltering oaks. And for the first time, the rapidity with which sound passes through the air, made itself felt in rasping indulations upon our nerves like the sawing of iron.

I was impressively reminded by this incident of proximity at one period of my life, to a kindly, though deluded editor, whose moments of relaxation were devoted to the production of similar discordant sounds—the truism, "that distance lends enchantment," at that time becoming well established. There were moments, as I remember, when I could but shudder at the thought of nearer contact than the four walls made possible; through whose protective thickness, however, I must admit, that the sounds passed off harmlessly enough. It was only when the imagination pictured the reality

of absolute nearness, that one's nerves became tremulous with alarm. Since this episode in my

THE RED FOX.

life, the sight of a violin pathetically reminds me of my infatuated, though well-disposed neighbor, and of his superhuman efforts in the cause of art.

The Briggs family are among the oldest settlers upon the prairies. Captain Briggs, a *cidevant* sea captain from New England shores, by the fortunes of life became stranded upon Minnesota soil, Mrs. Briggs being a lady of culture and refinement. A large family have grown up about them in their seclusion, with absolutely no advantages of society or education, aside from home influences. Yet they possess in a marked degree that charm of good breeding and delicate sense of the fitness of things which comes of good extraction, the germs of which, it seems, these wilds have been unable to extinguish. The Captain is reported to be somewhat rough of temper, his business transactions are unsatisfactory. It seems that he is far from popular in the neighborhood. Josh, the oldest son, some years ago attended a Dutch ball, when one of the company brusquely inquired if he was that "Tamn tevil Priggs' son." Josh repeated the story with genuine good humor. It would appear that Captain Briggs rather enjoys his reputation, as a protection to himself, perhaps. There is a grim satisfaction sometimes in being misunderstood. He can be courteous and polite

when he chooses, notwithstanding rumors afloat of fearful oaths brought in by the dashing waves, or wafted through the air from his distant dwelling. In some manner, such stories have gained circulation.

The family is a marvel, certainly, one of the sons being now engaged in the study of law at Sank Centre, while another is known as a brave hunter, slaying his deer by tens and twenties. Ben, it would seem, is of gentler mould, and sacrifices these grosser tastes at the shrine of heaven-born music; or with the enthusiasm of youth and inexperience, enters largely into the social haunts of pleasure. Anne, "sole daughter of their house and hearts," roams at her own sweet will through wood and brake; or with the grace of perfect mastership, steers her bark over the shining lake. At close of day her voice is heard in snatches of song, blending in cadenced melody with the sound of the rhythmic waves. A phantom boat, one might fancy, with siren voices luring the ear of mortals.

THE COMMON HARE.

But it is Ben whom one instinctively feels is born to an inheritance of fame. Not that he is

remarkable for any prominent grace or virtue; on the contrary, he is of that age when awkwardness borders upon the grotesque; an infirmity of which he appears so good-naturedly unconscious as to produce the effect of the most charming individuality of bearing. He expresses his opinions with becoming modesty in regard to affairs connected with the country around, of which, as a matter of course, he is preternaturally conversant, not depreciating its advantages, yet in no wise boastful. Incipient manliness is just noticeable in a crude assumption of style and language, which with experience will become transposed into a pleasing address, it would be safe to prophesy, proving in the end a fortune to Ben; genuine good nature, combined with intelligence, being everywhere gifts to insure success.

The long talked of hunting season is at hand, the game law having at this time become null and void; and now every tangle and thicket may become a possible place of concealment for the wary hunter. Camping grounds are selected for the repose of these mighty men of arms; generally beside some one of the lakes, and in the vicinity of farm-houses, we notice, betokening proclivities in favor of civilization at the first brush, however lawless they may become before the season is at an end.

It would appear that this is an exciting time in more ways than one, and that "The Assyrians come down like wolves upon the fold," in the shape of hordes of raw recruits from distant towns, who are ignorant of the first principles of hunting; shooting at random, anywhere and everywhere, rather more likely to shoot themselves or companions than any game. Ben related quite a number of incidents of tragic ending connected with the feats of these unhappy marksmen, which has left a depressing effect upon our spirits. The Professor derisively suggests the expediency of our remaining within shelter of the house during this alarming season. So far as I am concerned, his opinions are worthless; still, one would like to devise some means of keeping the barbarians at bay.

One young man, with enthusiasm oozing out at his finger ends, a few seasons ago, at the first blush, shot a young colt and calf, under the impression that he was bringing down deer. For one brief, triumphant moment, he saw his name handed down to posterity in story and song. Upon an-

other occasion, his ball just a companion, took effect upon dog. Accidents among the men are not unusual, ending in

Profound silence enshrouds Hunters move about noiseless bushes and trees with stealth there is a slight crackle of by a quick report, which one quite as likely to have brought companion as any game. It but fancy the "wild huntsman" us through leafy coverts, adding to our everyday life. Familiar possible surprises, and danger of. The Professor solemnly excursions we assume a loud ner, as affording protection pedigree.

It is far from pleasant, on that these quiet, sylvan places have been converted into battle the innocent; and shudders hears in every passing breeze the fleeing deer, hemmed in by his wily pursuer, together that all through the autumn roam the prairies with murder we, with brains befagged, hesitate taintly between precedent and Shamed in our truest feeling flesh of these victims, sacrifice instincts of man, in cowardly much that they are murdered is that we are haunted with wrong done to civilization through these animal instincts; and then some far distant future, of which we are ignorant, clearer light shall be revealed to us.

The Professor has returned, leaving our spirits calm and summer days are perceptibly a stirring briskness in the Leaves upon the trees have silently strewed the ground. from the lake, assumes proportion unnoticeable amid summer We have suddenly become of tectural fitness and symmetry charmed to note that it is no

us out of countenance in commonplace fixedness, but gabled roofed and turreted. Within, there are large rambling rooms leading into unexpected recesses of quiet seclusion, or opening upon piazzas enwreathed in trailing vines, which are so far of an imaginary character as to in no wise obstruct the glorious sunlight or the cooling breeze—bowers, since the expansive skies and plains of Minnesota have become stifling realities or inspired figures of speech.

Nature, with provident care, is silently gathering her forces; flowers have reached their zenith, and now, with perfume dead, lie fading beside stalks of yellow seedlings. One cannot help noting these changes going on all about us, or feeling that the heyday of summer is over. After fruition comes decay, and soon autumn in gorgeous

THE WOLF.

panoply of red and gold, will blend with the chilly breath of winter.

Dim foreshadowings fill the air; the present, with imperceptible transit, will soon rank in semblance of things past. Remembrance comes back to us in longings and tears. I would hasten; I would have the birds sing always; I would have inspiration remain always at fever heat. There is a time to flee from the dregs of pleasure; before the verdureless trees confront our gaze, or the gurgling waves lie hushed in the embrace of icy arms, I would reverently withdraw. What am I, that I should look upon nature in her humiliation, or gaze upon her nakedness, ravished of leaf and flower?

Before November's fleecy month has draped the  
VOL. IX.—28

plains, the "fire king" will have done its work, sweeping grass and herbage before its sirocco

THE BLACK BEAR.

breath; stealthily creeping through bush and tangle, winding its sinuous arms about the delicate tendrils of the climbing ivy, and reaching out with fiery fingers to catch the withered foliage fluttering upon the tree-tops; with snakelike evolutions, insinuating itself along the trail of fences, which guard inflammable hay-ricks and thatched roofed sheds, until, with the rising wind, the flames burst forth, sweeping on with resistless fury.

THE PELICAN.

The farmer's life in Minnesota is no sinecure; eternal vigilance is the price of safety to his hard-

earned crops. He watches the wind's course with lynx eyes, and when it is seen veering in his direction, turns out with horses and plough, heroically battling for his possessions through stifling vaporous smoke, which again and again exhausts his powers of endurance; when mercifully the changing breeze carries the danger to his no less watchful neighbor, where the conflict is again renewed.

The burning prairie is a grand sight; man's brave resistance through powers of reason, is a grand sight. No wonder that the oaks of the prairie are gnarled and stunted, when periodically they pass through these fiery ordeals; or that they pleadingly raise their dismantled heads to the gaze through seasons of growth and beauty, under the ban of their inevitable doom? When one considers, there is an indescribable pathos attached to the scraggy oaks, bringing them close to our human sympathies. Wronged, wronged! oh, hapless oak, yet no redress! Your grand symmetry of proportion twisted and tortured to unsightly deformity! Your luxuriant wealth of foliage shriveled to blackness! Gaze tenderly upon the gnarled oaks of the prairies, oh, ye careless travellers and sojourners upon the grass-covered plains of Minnesota! Consider that the fresh luxuriance which clothes the earth with beauty, furnishes but material for encompassing them in torturous flames.

Through the smoky atmosphere, and upon the breezy prairies, the bears come forth from their jungles. Acorns cover the ground, attracting these animals back to their haunts. For they, like the Indians, are passing on, only at intervals again encroaching upon their native domains. The hunter is well pleased with an occasional shot at these witless adventurers, who thus prefer the acorns of past joys to the food which, in the changes of life, the Fates have provided for them. Conservatism has its elements of danger. Progress, my dear bears, is the theory now-a-days. No turning back to the acorns of a past decade! On, on to the Rocky Mountains, oh, bears, oh, Indians! Civilization, with whip and spur, pur-

sues your fleeing steps! Press less footsteps, tramples upon when, with wounds staunch her.

At last the great, sad prairie's garb. The cold, bounding shudders through the frame; terrible pain we turn to the hospitable signals beckoning there, and human sympathy; the icicled porch, and the ring beside the well. Charley's ments of huge dimensions, way to the big barn, where congregated. Charley reigns; animal is under control, and through the power of that love which is lovingly heeded. Persons who emphasize the words are never intruded upon, he commands respect.

Yonder, smoke from a wigwag eddies above the Tamarack half-breeds are encamped for winter months. They under the deer, and have pitched the shot of their bounding foot of the deer intersect each other cobweb, all through the swam-

The lake lies dumb beneath. Last spring a flock of pelicans upon its waters in reposeful; suddenly they took their flight; white-winged pelican will bosom, or from whence they they go? Were they exploring genial shores? Had they, with the spirit of change? North, oh, adventurous birds, your wake; there's danger! Trust not the quiet of peace back, oh, bird of the North!

The prairies in still bounding and on. Through the mists gleam the solemn prairies.

## RIPPLES FROM THE RHONE.

BY FRED. MYRON COLBY.

## IN TWO PARTS.—PART II.

OF course the traveller visits Vaucluse, only fifteen miles from Avignon, whose grottoed rocks and limpid waters are more closely associated even than Avignon with the name, life, and works of the Italian poet. Is not this man in some sense overestimated? He had the good fortune, indeed, to perfect a living language, although it had been his chiefest ambition to write eloquently in a dead tongue. He gave harmony, purity, and even stability to the Italian, utilizing its resources so wonderfully that scarcely half a dozen words have been rejected by later writers. Nor is there anything gross in his writings. A tone of pure and melancholy sentiment pervades all his works, and the scholar seeks in vain for any of those impure metaphors and licentious tales which characterize the amatory poems of antiquity and most of those of his own age. These are Petrarch's excellencies; but we are speaking of him as a great poet. In strong original conception, in that flowing, easy grace of narrative which is necessary to command a sustained interest, and in that keen analysis of character and perception of truth which marks the true poetic genius, Petrarch is the least among all the Italian poets. With Dante, indeed, he is incomparable. The author of the "Divine Comedy" occupies a niche by himself, and is unapproachable. His orbit is still all his own, and the course of his chariot can never be confounded with that of a rival. Neither did Petrarch write anything worthy of comparison with the *Gerusalemme liberata* or the "Orlando Furioso." The great epic of Tasso is well-nigh unsurpassed in grace of diction, unity of action, and vividness of description. How quick his transition of ideas, how beautiful his comparisons! After the *Æneid*, there is not, in my estimation, another poem which has so few weak and tedious passages. Its greatest defect lies in the too great prominence of supernatural machinery. Yet this is hardly to be criticised in a poem. Ariosto, without being so great a poet as Tasso, has written some finer poetry. His "Orlando Furioso" is fairly alive with its facility of versification. He possessed some rare gifts. In

his facile grace of expression, and fertility and versatility of invention he holds a first place among the poets. There is nothing, in fact, in the whole range of poetry that for vivacity and genial flow of movement equals some portions of his large poem. In the grand quaternion of Italian poets it would appear then that Petrarch is the least worthy of admiration; yet faulty as he is, as the restorer of classical literature in Italy his services are unquestionable. His strains, so overestimated and admired by his own age, and by the writers of the Renaissance, conferred a benefit in elevating and refining the imaginations of youth, which criticism can hardly estimate, and which may have had much to do in the general judgment of his genius. In Avignon is the tomb of the beautiful Laura of Noves, the poetical mistress of Petrarch, whom he has immortalized in a hundred lays. Poor sighing Petrarch, and gentle, uncomplaining Laura! Yet who ever seriously believed in the love of this devoted pair of turtle doves? The story, nevertheless, is a charming one. You can picture the first romantic meeting in the church of St. Clara at early matins, and the sentimental encounters after, between the poet and the dame, extending through a period of twenty years, during which time the etherealized lover never ceased to inscribe sonnets to the beauty of her eyes, the rose of her cheeks, and the various charms which physically and mentally endowed the wife of Hugh de Sade. Possibly Petrarch deemed himself enamored. A man of ardent imagination and an enthusiast in all the emotions of love, friendship, patriotism and ambition, it was quite natural that his muse should be awakened by the beauty which charmed his fancy even if it never touched his heart. If true indeed that he cherished such a remarkable devotion to this woman, who it appears led a very miserable life with her morose and cynical husband, the only matter of astonishment, knowing what we do of the age of Petrarch, would be the persevering virtue of Laura. The troubadours boast of much better success with Provençal ladies. But we do not once believe that he did. His emotion was

too evanescent, his nature too selfish to love after such a manner. There could have been nothing manly, natural, or impetuous in his affection. It was simply an affected passion, a poet's dream.

You do not believe this, fair reader. Look, then, my dear madam, upon that portrait of Francesco Petrarch which adorns your library wall, and tell us if you think his is the face of a lover, of a man of strong and energetic passion, of deep and constant devotion. You perceive a countenance fat, round, and good-humored. Every feature tells the same tale, from the rounded and dimpled chin to the brow overhung with its clustering hair. The cheeks full and florid, the lips large and voluptuous, the eyes sagacious, sharp, and penetrating, are all indicative of good living, self-enjoyment and portly prosperity. It is the face of a vain, ambitious, pleasure-seeking man, a courtier, a savant, a gourmand, and a sensualist, but of all sensualists the most susceptible of elegance. You do not believe in this mock passion of Petrarch's? Follow him then through his varied, brilliant career from that April morning in 1327, when he first saw Laura's fair face under the veil of the devotee, till the day when his life closed at Aargau, forty-seven years after. What a sunny and honored life he led, going from court to court, from city to city, from castle to castle, the friend of all the great nobles of France and Italy, courted and fêted for his genius, his graceful appearance, and the reputation of his learning, the guest to-day of the Pope, to-morrow of kings, and the next of princes as powerful as kings! Fancy this man, learned, intriguing, pleasure-loving, amid all his exciting and luxurious life, his vast literary and political labors; fancy him, I say, the victim of an unrequited passion which was as ridiculous as it was incapable of moral defence. Nay, more, you think him truly the devout worshipper of Laura from the moment of the first sentimental encounter in the church of St. Clara to the time he indited her his last sonnet when she was a fat, comfortable matron, head of a large household of grown-up children who called her mother! Felicitous innocence! You forget that the poet of *Vaucluse*, like most other poets, and after the fashion of his indulgent, sensuous Italian race, sought the pleasures of love without hampering himself with the conjugal tie, being the father, under the rose, of a family of which Laura was not the mother. How servent and exclusive was his passion, was it not! Away

with the idea! He cherished no more love for her than is generally wasted by an artist on his lay figure. He used her for a subject when in a certain poetic mood, but I doubt if he ever wrote sonnets about her when he had anything else to do. When composing his epics, when engaged in political intrigues, or when receiving the crown of the poet laureate at Rome, there was little thought in the mind of this thoroughly selfish and worldly man of the beautiful but unfortunate Laura de Sade.

Looking back at the clustering towers and church spires of Avignon, eyes and heart sorrowful at the departure, and our ears still vibrating with the distant murmur of the fountain of *Vaucluse*, we sail down the river. On either hand of the proud stream sweep the lands favored by poetry and romance and song beyond all others after Italy and Greece. The rich plains of *Languedoc* and *Provence*, home of the troubadours; where fair cities cluster with sonorous names; where fields of olive trees, with their gray leaves, and oleanders border the stream, alternately meet the passing vision; where the people still speak a language born of Attic and Tuscan softness; these are the lands we are gazing on now, and the beautiful river flows through the midst instinct with life, hastening on to join its current with the waves still warm from the sun of the *Bosphorus*. Past *Beaucaire*, on the right bank of the *Rhone*, connected by its suspension bridge with *Tarascon*, and whose annual fair, established by *Raymond*, Count of *Toulouse*, in 1217, was once the largest in Europe, we steam. A broad champagne country, fertile to magnificent luxuriance, the rushing *Rhone*, dotted with green islands, a city clustering on a hill, and a castle crowning it, and we approach *Arles*—*Arles*, famous for its ancient renown and the beauty of its women.

*Arles* is, perhaps, the oldest city in France after *Marseilles*. Great, glorious, beautiful once, she sits weird, withered, superannuated, feeble now, warming her palsied limbs in the sun, and looking vacantly down on the broad, impulsive river that reflected so much of majesty in days long gone. Here are are walls built, likely enough, before *Nismes*, her sister, sent an emperor to reign on the *Capitoline*, and which still attest the grandeur of the ancient city. There are also a broken ring or two of an amphitheatre; for all of these secondary cities of the Roman Empire copied the

manners of the capital, and Arles was the miniature Rome of Gaul. It is suggestive to seat one's self upon these solid granite seats, where, eighteen hundred years ago, some haughty Roman prætor, wrapped in his purple toga and preceded by grave lictors and followed by cringing slaves, sat with his straight-nosed wife and looked placidly on while gladiators were butchering each other in the arena below.

The day is fair, and we wander out beyond the walls of the city. A lovely picture is stretched around us; the sun shines down on the quiet French town, the stately historic castles, and the deep majestic woods that hid in their bosom alike the crime and despair of the erring Norma, the beauty of the "four daughters of Raymond Béranger, every one of whom became a queen," and the loves of many a Provençal youth and maiden whose names are not known to fame. The birds sang above us amid the dense foliage of those shadowy avenues that used to echo with the bay of hounds, the ring of horses' hoofs, the mellow notes of hunting calls, when through these sunny glades the gay courtiers of King Bozon, Count Béranger, and Duke Charles, had ridden for the pleasure of the Chasse and the Curée. Beautiful was the picture now; what must it have been when the luxurious, jeweled, tiara-crowned city reposed in her stateliness and pride on the river's bank like Cleopatra on her couch, when scholars and troubadours made the name of Provence known far and wide, and all that gay human life that from Cæsar to the twelfth Louis held their rendezvous, their fêtes, and their sports in Arles and her royal forests?

The Provençal literature which did so much in smoothing away the iron prejudices and customs of the dark ages, and opening a path for the nobler periods which succeeded its own, has left but little of its genius worthy of our esteem. Poetry was the great art cultivated, and it was amatory poetry. Love and gallantry were the subjects which the troubadours generally chose, although they produced a few satires which are keen and spirited. But no romances of chivalry, and hardly any tales are found among their works. The *gaisaber*, or "Gay Science," as that literature was called, according to the doctrines of which love was the principle of all virtue and of all glory, lit up, however, with a blaze of glory, all southern Europe for two hundred years. At the

courts of Arles, of Toulouse, and the Norman courts of England and Sicily, in Spain, and among the Guelph princes of Northern Italy, swarmed a multitude of lyrical poets, many of whom have had their names handed down to posterity. Even kings and nobles did not scorn to court the tender muse, and it was considered as essential in the training of a knight, that he could compose a *canço*, and accompany the same by the music of his flute as that he should be able to couch a lance in the tourney. Richard Cœur de Lion, invincible paladin as he was, prided himself more for his skill in minstrelsy than he ever did for all his brave and gallant deeds performed in the joust or on the battle-field. Nor was the kingly Plantagenet the only one who did so.

Possessing a flexible and harmonious language, the Provençal poets invented a variety of metrical arrangements perfectly new to the nations of Europe. Almost every length of verse, from two syllables to twelve, and the most intricate disposition of rhyme, were at the selection of the troubadours. Commanding such a choice of poetical sounds, the Provençal poetry possessed some rare advantages. Yet there is little of it which has come down to us that gives us any poetical pleasure. There is a deficiency of imagination and of vivid description which is not generally wanting in the works of true genius even in the rudest periods of society. Metrical compositions are in general the first literature of a nation, and we know of no instance where so little skill and learning is exhibited in the early attempts of nations yet in their infancy as in the poetry of Provence. Even in the poetry of sentiment, the favorite province of the Troubadours, there is very little of natural expression, and consequently our interest is seldom aroused. Nor could we deem those fantastical solemnities styled "Courts of Love," where poetical advocates, under the arbitration of certain ladies, debated ridiculous questions of metaphysical gallantry, as much calculated to create any genuine excellence. Poetry, in her noblest form, is a child of solitude and reflection; how then could we expect to find her here in the gay whirlpools of fashion and life, where her chiefest votaries were knights and ladies whose names were not always above reproach? The great reputation, however, acquired by the troubadours, and the panegyrics lavished upon them by Dante, Petrarch, and the other Italian poets, could

not have been wholly undeserved. Undoubtedly, they are judged at a disadvantage through the translations we have received. The charms which may have existed in those ancient days evaporated to a certain degree in reversion. Their poetry, moreover, was of that class which is entirely dependent upon music, and rather by the power of sound than by any stimulant of imagery and passion excited the fancy. Upon this connec-

tion and upon the admiration into which mankind is easily deluded by exaggerated sentiment in poetry, they depended for their influence and celebrity. Vapid and uninteresting as most of their productions appear to our intellectuation, they exerted a mighty sensation in their own age, and left a permanent influence on the state of European poetry. It is well to measure the influences on the present of such past creations.

### CHIPS UNDER THE SNOW.

BY J. P. McCORD.

SHE carefully gathers the chips of wood,  
Gathers one by one from under the snow;  
O, if the great Father in heaven is good,  
Why does he on her so little bestow?

She gathers the chips from under the snow,  
While on her thin cheeks and through her gray hair  
The rough winter winds remorselessly blow,  
And needles of frost are thick in the air.

But once her thin cheeks were rounded and fair,  
And once her gray locks were glossy and brown,  
And once of the world she had her full share,  
And asked not for more her blessings to crown.

Her boy's merry voice was a song in her ear,  
His misshapen words oft moved her to smile,  
For more than he knew her heart he could cheer,  
Could more than he knew the dull moments beguile.

When night o'er the world its shadows had spread,  
She laid him to rest and covered him warm;  
And if the storm-wings but rustled o'erhead,  
She doubled the folds above his dear form.

Still tenderer grew her motherly care,  
When pallid he lay, and wasted and weak;  
Nor would she her toils and vigils forbear,  
Till roses of health rebloomed on his cheek.

Her boy was her hope. She looked to the time  
When all her fond love he well would repay,  
When forth he would stand a man in his prime,  
And be to her age a comfort and stay.

Ah, hope is a bud which never may bloom;  
Though love's sleepless eye may watch o'er it keep,  
Yet some hidden bane its life may consume,  
And leave the wrung heart to wonder and weep.

The son is a man, tall, hardy and hale,  
The mother is old and feeble of limb;  
He leaned upon her slender and frail,  
O surely she now may lean upon him!

Alas, there are hearts akin to a stone,  
Hearts where compassion no softness has shed;  
So stony is he, for, cheerless and lone,  
In life's roughest ways he leaves her to tread.

She misses him now! How sad is the thought  
That the paths of his youth are spurned by his feet,  
That mocking the wisdom which once he was taught,  
He loves the low place where the sensual meet.

Alas, he is there, and pleasing his lips  
With cups more inflamed than innocence knows;  
Is there, while his mother is searching for chips,  
With cold-reddened hands beneath the loose snows.

Rich with a few chips, she turns to her room,  
And rouses her fire with sedulous pains,  
To relieve, if she may, the chill and the gloom,  
And urge the lag blood along her old veins.

We know the great Father in heaven is good,  
For freely his gifts he scatters below,  
And did men but order their lives as they should,  
Along in their ways how blest they might go!

No, not to God's works, their friction or flaws,  
May man their unrest or sufferings trace;  
The evils they bear find ever their cause  
In follies, in errors, or sins of the race.

See thousands, by lusts of the flesh overborne,  
Pursue the sure road to sorrow and pain;  
See thousands, though voices may warn them, and warn,  
Yet lift the vile cup, and drain it, and drain.

While others, whose cheeks never burn with a blush,  
Deal out the strong draughts to all who will pay;  
And evils, as floods from full fountains rush,  
Break forth over homes, and flow far away.

What mystery shadows these human affairs!  
O where is the man whose wisdom can tell,  
Why God with all sin so patiently bears,  
Why earth is so like a province of hell!

How oft a hard lot to virtue is dealt,  
A blot on her name, a shaft in her breast!  
While guilt, the terrors of conscience unfelt,  
Goes gaily along, unsmitten and blest.

While some proudly move with hands full of gold,  
Or leisurely sit by their fire's full glow,  
How many in want, enfeebled or old,  
Must glean their scant wood from under the snow!

There sure is some shore, though yet out of sight,  
Where all the dark things which puzzle us here  
Shall brighten to proofs of wisdom and might,  
And be to all eyes illumined and clear.

Then woe to the souls that cleave to the wrong,  
And woe to the souls on others that prey!  
For just is our God, though silent so long,  
Yes, vengeance is his, and he will repay!

REMINISCENCES OF CHESTER, PENNSYLVANIA.

By H. K. W. WILCOX.

CHESTER, originally called Upland, is the most ancient town and county seat in Pennsylvania. It is famous as the first landing-place of William Penn within the province, early in November, 1682. He had previously landed below, at New-castle, October 27th, where he was warmly welcomed by the Colonists "of all peoples, tongues, and nations."

When Penn arrived at Upland with his party of Friends, they were hospitably received and entertained by Governor Robert Wade. On this occasion Penn addressed his friend Pearson, one of his own Society who had accompanied him in the ship *Welcome*, and said:

"Providence has brought us here in safety. Thou hast been the companion of my toils; what wilt thou that I should call this place?" To which Pearson replied: "Chester, in remembrance of the city from whence I came."

Among the first buildings of importance erected in the place was that occupied by Robert Wade as his residence, but subsequently used by the Assembly of Pennsylvania during its meetings at Chester. It was afterwards known as the Essex House.

Here Governor Penn met his fellow-colonists, and with them projected the future plan for the settlement of the country. Here he was bountifully received on his return from England, and the old Essex House was famous as the headquarters of the Governor and the seat of Government. All vestiges of the old structure have long since passed away. It stood about two hundred yards from Chester Creek, near the banks of the Delaware, and on a plain about fifteen feet above tide-water. Skirting the river bank stood a number of lofty pine and walnut trees. The gable-end of the Essex House pointed on the Delaware, and the southwest end pointed on Essex street; its back piazza was on a line with Chester Creek, which separated the house and farm from the town of Chester.

Robert Wade owned all the land on the side of the creek opposite Chester, extending back some distance up the stream. The Chester side was originally owned entirely by James Sanderland, a

wealthy Swedish proprietor, and extended back into the country a considerable distance. Sanderland was a prominent Episcopalian, and founder of the old St. Paul's Episcopal Church of Chester. A monument of fine sculpture of that time was erected to his memory at his death in 1692. None of his descendants are now living.

On the same spot was erected a monument commemorative of the first "A. M." of Pennsylvania. The following is the inscription:

"Here lieth Paul Jackson, A.M. He was the first who received a degree in the College of Pennsylvania; a man of virtue, worth, and knowledge. Died 1767, aged 38 years."

Paul Jackson was the ancestor of Dr. Samuel Jackson, of Philadelphia, and brother-in-law of Hon. Charles Thomson. He is spoken of as one of the best classical scholars in his time; and took part in the Braddock Expedition.

The brick house owned by John Hart, in which the first Assembly of Pennsylvania was held, was in after years used as a cooper's shop. It was a one and a half story structure located near the creek. The oaken chair in which Governor Penn sat, as Chief of Assembly, was long after preserved in the family of Colonel Frazier.

At the mill seat on Chester Creek was originally located the first mill in the country, and was erected by Richard Townsend, who brought the materials from England. The iron vane was preserved many years after the old mill had passed away. The initials represent the original partners who owned the mill: "William Penn, Samuel Carpenter, and Caleb Pusey." The date 1699, of the erection of the structure, was also inscribed on the vane.

Near the site of the old mill stood the residence of Richard Townsend, a low stone building of rude finish, one story high. In its day it was considered a dwelling of no mean pretensions.

Not far from this locality, which was known as "Ridley Creek Mills," was a rock upon which was cut the date and initials, "J. S., 1682," marking the spot where John Sharpless, the original settler, erected a temporary hut, immediately after his arrival in that year.

We have evidence in the following petition issued in 1700, of the ambitious expectations of the early inhabitants of Chester, looking forward to the growth and thrift of the town:

"Whereas, Chester is daily improving, and in time may be a good place, we pray that the Queen's road may be laid out as direct as possible, from Darby to the bridge on Chester creek."

This paper was signed by ninety of the inhabitants of Chester and vicinity.

Jasper Yates, a son-in-law to Sanderland, erected, in 1700, "an extensive granary, which received much of the grain from Lancaster and Chester Counties."

Soon after the first colonists arrived by the Factor, in December, 1681, the Delaware was frozen over at Chester where they located. Several ships arrived in the spring of 1682.

It was during the early "Councils of Brotherly Love," which convened at Wade's house, at Chester, which were participated in by representatives from all the families of Friends which had settled in the vicinity, that the project of a great town, or "City of Brotherly Love," was inau-

gurated; and that location was primarily the centre at which it was proposed to found the great metropolis. But Chester Creek could not compete with the Schuylkill; and it was declared that Philadelphia, which had been planned by William Penn, was the more eligible spot, and "that it seemed appointed by its two rivers and other conveniences for a great town."

Penn, in a letter of instructions to one of his agents, concerning the plan of Philadelphia, says: "Let every house be placed, if the person please, in the middle of its plot, as to the breadthway of it, so that there may be ground on each side for gardens, or orchards, or fields, that it may be a green country town, which will never be burned, and always be wholesome."

A family named Preston, living in Bucks County, relate that one of their ancestors witnessed the arrival of William Penn, an account of which he gives in the following language:

"When the ship in which Governor Penn arrived from England came up to the Neshameny, he was met by the Indians. The masts of the ship struck the trees of Levade's Hill (where subsequently the navy yard was located). The white settlers and Indians joined in preparing a bountiful feast for the Governor and his family. William Penn walked with the Indians, sat down with them on the ground, and ate with them roasted acorns and hominy. This pleased the Indians so much that they began to show how they could hop and jump. Penn, much to their delight and amusement, then joined with them in jumping, and he beat them all."

## TO A WIFE.

Out! hadst thou never shared my fate,  
More dark than fate would prove,  
My heart were truly desolate  
Without thy soothing love.  
But thou hast suffered for my sake,  
Whilst this relief I found,  
Like fearless lips that strive to take  
The poison from a wound.  
My fond affection thou hast seen,  
Then judge of my regret,  
To think more happy thou hadst been  
If we had never met!  
And has that thought been shared by thee?  
Ah, no! that smiling cheek  
Proves more unchanging love for me  
Than labored words could speak.

But there are true hearts which the sight  
Of sorrow summons forth;  
Though known in days of past delight,  
We knew not half their worth.  
How unlike some who have professed  
So much in Friendship's name,  
Yet calmly pause to think how best  
They may evade her claim.  
But ah! from them to thee I turn,  
They'd make me loathe mankind;  
Far better lessons I may learn  
From thy more holy mind.  
The love that gives a charm to home  
I feel they cannot take:  
We'll pray for happier years to come,  
For one another's sake.

## THE FAIR PATRIOT OF THE REVOLUTION.

BY DAVID MURDOCH.

(Concluded.)

## CHAPTER XLI. A BRIDGE OF GOLD FOR AN ENEMY'S RETREAT.

THE plan adopted by the Dominie's party had been scrupulously carried out, and at the same time so secretly, that not a rumor of their approach had reached the camp of the Mohawks. Their reverend leader had two objects in his mind: *Firstly*, as he would have said himself, to prevent any communication between the North and the South through Brandt's aid. It was reported that the lady spy was a young man in woman apparel, who had succeeded in making his escape by the way of the Round Top. Every member of the Consistory present said "he must be prevented." "The he jade!" said the roused pastor; "we must skin her this time."

"Aye, aye, minister," said Grant; "skin for skin, as the Scripture says; and fegs, sir, your name is Skinniman; but it's no easy putten saut on a mouse's tail."

"We must keep the rascal from getting on board the ship: and *secondly*, my brethren, deliverance of the captives. If we can drive the savages back, well and good after that; let us try."

There were some who insinuated concerning the officers on parole, as if they were on a pretended hunt; but the Dominie would not allow a word to be spoken against their honor; and when any one whispered suspicion of Clarence, the good man got so angry that all were glad to hold their peace except Mat Van Deusen, who wanted to know more of those "paper things that had such power."

As to Clarence, who did not appear till the close of the chase, there was before him a daring course, which he did not hesitate to pursue. He entered into the circle that morning, resolved to follow the chief robber, and either thwart him or die. The attention of Clifford was early arrested to the movements of his mysterious countryman. The experienced soldierly air of the youth, who held his head up so firmly, and the manner in which he stepped from stone to turf, put him on the alert. Perhaps the features of Clarence might recall an image discovered by his conscience of late

in his dreams: a face which he was impelled to follow, though it spoke of vengeance. Once he was upon the point of demanding of Clarence who he was, and why he followed him, when some call in the chase diverted him from his present aim. When the hunters made their first stop, the two did not meet in the bed of the cascade. During the second part of the chase, Clarence was not so successful in keeping Clifford in view. That wily sinner had more persons to watch than one. The two Indians, Kiskataam and his foil, had made a sudden turn around the corner of a rock, and being suspicious of treachery during these two days past, Clifford followed them at full speed, coming up to them just in time to take the captive out of their hands, and to meet his own reward. When Clifford and Clarence did meet, it was to scowl that fierce frown which proud men, whether victors or defeated, send out upon each other when hate burns freely, but which passed over Clarence's face the moment he saw his sister safely out of the traitor's hands.

The division under Van Vechten fell back, so as to release the captives taken off by force from the Vlatts, while that under Salisbury drew away to the west, so as to intercept the Mohawk on his retreat. The moment he perceived the treachery of Clifford, and found out that Miss Clinton, whom they had been waiting for so long, was not the daughter of the rebel Clinton, but of the great soldier, his men were ordered to the west through Katrina Montour's country. The red men, impatient of delay, were already on the road, and their chief only remaining behind that his mind might be fully satisfied, when the war-whoop of his tribe was sounded with the nona—retreat.

Salisbury, who had posted his men on the side of a rising ground which looked to the southwest, lay down, quietly waiting the van of the enemy. The orders were "do not rise till the party has passed at least half through; then take him in the flank. Keep your ears open for the word."

The Dominie, who came up to this party, after surveying their position, insisted that the space before them gave the Indians too good a chance for

keeping clear of the ambuscade, and that they would be discovered before the main body came forward. "I am for giving the scoundrels a bridge of gold to retreat by, but not quite so wide as that." The reverend pastor was right. Some impatient, undisciplined militia-man gave a loud call to a comrade just as the Indians were turning the angle of the hill, when a pause was ordered, and a wide sweep taken; skulking among the trees and by the knolls, Salisbury ordered one volley, but the bullets fell short of the aim. The rest was a scattering fight, with the exception of a show of battle; but when Brandt himself came up, the skirmish was a mere frolic. The moment that chief appeared, the blood of the Dominie rose so that it took all the force of the company to restrain him.

"Let me alone if you will not help. Don't you see the heathen tiger there, how he stalks before us, with as much assurance as Goliath did with his greaves of brass and his weaver's beam. Let me give him one stone at least, I tell you, from the back of that tree on the other side of the valley. I may bring him down and revenge the country for the blood he has shed at Cherry Valley and Wyoming."

"Yes, but Dominie, he will send that tomahawk of his through your skull before you load again; and you are too heavy to run fast." This was said by the captain, with a sly wink to the rest.

"Stop there, you bloody pagan, till I get one shot at you," shouted out the earnest man; and with that he let fly, but his mark had a tree between him and the muzzle before the trigger was drawn. Well was it for him, for the aroused minister was a good shot, and the ball sank into the trunk of the tree. Brandt, to show that he did not despise the black coat and cocked hat, came out suddenly and returned the fire, so that the bullet whizzed over the mark, without injury.

"Come out from that, you skulking red-skinned murderer," the Dominie roared out at the full pitch of his voice, "and let me have as good a chance, and see if you ever reach the Mohawk flats again."

By this time the Indians had succeeded in finding their way by the bed of the stream that runs by the foot of the hill, and it would have been folly to follow, more especially as all the prisoners, with the exception of Elder Abiel and his son, had been recaptured by the reserve under the

command of Grant. That eccentric mortal, on the watch for a chance to distinguish himself, came upon the enemy's rear at the time of the surprise produced by the sudden appearance of Salisbury, and carried off Martin Schuyler, with others, in triumph. The guard set over the captives were some of their disguised neighbors, who, justly dreading the wrath which would come on them, now that their cause was lost, ran in double quick time away from vengeance.

"Tak care o' thae puir captives there," Grant roared out, "a deel's dozen o' you; let the rest o' you follow me after thae fause guissards, deceitful loons that they are. Were I but within ten yards o' them, if I would na pepper their douns for them—'Dredge their drodem,' as my granny, honest woman, used to say."

All this time the big brawny fellow was running at the head of his party, uttering all kinds of speeches against the heads and hearts of the renegades before him, till he got as near to some of them as was safe for himself, he being actually alone, when there were half a dozen of the terrified false faces turned upon him in desperation. For the time he forgot that a mean fox, when earthed in his hole, will snarl and bite the largest mastiff. One figure, who turned out to be the town tailor, wheeling around in terror, plunged a knife into the fleshy part of the Scotchman's arm, and nearly succeeded in giving Grant his last lesson.

"You miserable neer-do-weel," said Grant, "is that the way you meet your neebors in the woods that have come sae far, and at sic expense, to see you?"

So taking the frightened artist by the nape of the neck and the seat of his breeches, he shook him with a force which made his teeth chatter and his eyes to start out of their sockets.

"Tak that, you limpin limb o' hungry humanity, and see if you can learn to behave yoursel at hame instead of here, thewen your camsie grey claih." And with that he renewed the shake, till the tailor, in an ague fit of horror that made every hair stand on end, screamed out:

"Mercy, mercy, Hughie Grant; let me go, and I'll be as true a Whig as ever breathed, all my life long."

"Mercy, indeed," said the other, "after you've tried to put that whittle up to the heft in my brisket bane. You see by that bluid rinnin there

what your bodkin has done, you false loon. I'll tear the garment aff you, as Abijah did the son o' Jeroboam, and send you hame to clip the tails aff lice."

And with that he put his great fingers up to the throat of the tailor, stripping him from head to heel of all his Indian garb, then taking whatever steel was in the dress, he left him to buckle on what was left of it, while he ran in search of other renegades.

But it was every man for himself there on that day. The place was favorable for hiding, and the few that were caught were punished on the spot, if worth punishment, or suffered to run out of the way, lest they should know them and be obliged to notice who they were. Some followed in the trail of Brandt, afraid to return.

On Grant's going back to his party, he met the Elder Abiel, together with his son, walking westward at full speed, as if retreating. The Scotchman, confounded at the sight, came up to them, saying, in his broadest style of speech:

"Whare the warl are you gaun noo, Mr. Abiel? One might think you had got enuech o' the hill, by this time, to mak you turn your face the ither way."

"I am running after Brandt," said the old man, sorrowfully. "I am afraid I shall not get up to him. David, here, will follow me, though he is not obliged to go. See if you can get him to return back with you. We can be both ill spared from home in these times."

"What does this mean?" the Scotchman cried out, scarcely comprehending what he heard. "Are you gaen fey? Tell me, Dauvit, for you seem to have some sense left."

Abiel's son, to whom this appeal was made, said, in a grouty way, that the whole company had had the chance of escaping that morning, had it not been for his father.

"When I awakened," said he, "the Mohawks were asleep, every man of them, their arms all stacked against a tree. I whispered, now is our time, when dad just raised his head, looking around, and, as he lay down, said he would not do that for all King George's dominions. Some nice freak of what he calls honor. For all that, where he goes I go, though it should be to the gallows."

"David," said the Elder, "do not speak in that way, else I will command you to return.

Here is the Dominie coming, I will leave it to him."

That earnest leader of the camp of Israel had, after his own personal combat with the big Mohawk, all but forced Salisbury and his party back from pursuing the enemy. Though his own blood was so hot that he was ready to meet Brandt, or anything else on the open field, he was too cautious a man not to see the folly and the danger of attempting to intercept or pursue an Indian army, under such a leader, far into the wilds. For with all this prudence, he had no small idea of his own knowledge of military affairs, derived from an extensive reading in ancient and modern history, which he was apt to quote a little too freely, and in the circumstances of the times—laughably.

He was laying down the laws of war to Salisbury in his loudest tones, with his usually violent gestures; the latter impatiently listening to what he thought he knew better than the reverend soldier. As they both came along side by side, they were seen by the others who were waiting for them. The Dominie, in no hurry now, riding as he was, a favorite hobby, came on striding over the narrow bridle path—for he was what jockeys call, a wide traveller—stopping every tenth step, putting his broad body in the irritated captain's way, who had been robbed of a share in the laurels won.

"You see, Billy, you were nearly caught in the woods like Absalom: you and your men would have been cats' meat to these savages. You see, Billy, when the Trojans and the Greeks fought with each other, the one had the goddess of wisdom, Minerva, on their side, and the other, Mars. Had I gone with you, then it would have had these two, and we might, with God's help, as I always write on all my prescriptions, have prevailed. But, Billy, I could not do anything without your arm; nor could you do without my counsel."

"That may all be true, Dominie," said the person lectured; "but when a man is taunted with cowardice, he is willing to throw all on the chance of proving his courage."

"Poh! is it there where the pain lies? You are no coward man, if that will please you; and that you have not had Ulysses by your side, is not your fault. You are Hector himself, only had you but chosen that narrow passage on this side of where you planted your men, you could

have riddled those red skins, so that they would have fallen like the soldiers of Xerxes at the straits of Thermopylæ; and we would have hailed you like another Leonidas this day, bearing you back on our shields in triumph. That would have been something to be proud of. But what have we here? My own honest brother, Elder Abiel, once more free! God be praised, that our war has not been in vain. We shall have a day of thanksgiving for this blessing, were it for nothing else. My right arm is restored to me."

"Nae sae fast, minister," said Grant; "the Elder says that he is on his way to Neaugra. He's neither to haud nor to bind, willy illy."

"What is the meaning of this?" was the really anxious inquiry of the Dominie, who feared that the mind of his friend had suffered in his captivity. "Surely you cannot be so taken up with a heathen's company, that you should prefer it to the fellowship of the saints."

The Elder only shook his head, for his heart was full. David, his son, took it up by saying that his "father had taken it into his head, that he was bound in honor to Brandt, for some kindness he had shown to him, and he was now on the road to offer himself up."

"Let us hear," was the alarmed Dominie's words, "what is that point of honor that makes you so sensitive; for it must be very clear and strong before I will consent to such a loss as Garret Abiel. Our labor and our blood must not be thrown away in vain."

Grant, who had been impatiently waiting for a chance to put in a word, hastened here to say, "that's true, minister; I am for carrying the Elder back. We are strong enough, a' hands of us, and though we read in the second book of Samuel, the twentieth chapter, and the aughteenth verse, if I'm na mistaen, that they were wont to speak in old times, saying 'they will surely ask counsel of Abel,' and so they ended the matter; I'm thinkin' it was na this Elder Abiel, for they were not sae foolish as to put themsels into the hands of the Philistines."

The Dominie, who stood perfectly confounded at the position of the Elder's affairs, looked Grant in the face all the time he spoke, seemingly thinking on something else, and not conscious of anything that was said by the Scot, at the close drew a long breath, repeating his own words, "all our labor in vain, and what a loss!"

"Yes, minister, I've just been reflecten," said Grant, "that this wee fecht o' ours is waur to us than the battle o' the Shirra muir was; whare a neebur o' my toon lost his faither and his mither, and a gude braid swourd that was worth them baith. What think you o' that?"

The good man smiled. In other circumstances he would have laughed aloud; but turning to the Elder, he desired a full account of his pledge given to the Mohawk; which when he heard, he sighed and said:

"I am sorry; and I am rejoiced. We must part for the present. Such honor is not seen but in the true-hearted; and God shall reward it. Proud am I this day. Your example will weigh heavier than the hills; and what is best of all, our good Dutch Church is represented in you this day, and the fame thereof will go far among the Gentiles even unto the ends of the earth."

The Elder here held out his hand firmly, which the Dominie grasped, taking off his hat as all did, feeling that an act of devotion was to follow; for the good pastor poured out a most fervent prayer, ending with the apostolic benediction in Dutch: "*De genade onzes Heeren Jesus Christus zij met uwen geest! Amen.*"

"Now, David, see that you watch over your old father; and watch every chance for escape. Don't forget your catechism and the canons. There is a copy for you; have it all on your tongue's end, when you come back; and you can read the marriage service now and then, and I'll join Susy Myers and you together. Keep up a good spirit."

"Oh, yes," said Grant, who was always ready, "a stoot heart to a stay brae; faint heart never gained fair lady."

The two companions parted here, the Abiels with a white handkerchief on the top of a pole as a flag of truce in case of accidents on the way to the camp of the Indians, and the Dominie to the Flat Rock, where all were gathering preparatory to their descent down the mountain side. Already the chief persons were assembled, and waiting the decision of some controlling power. Bertram and Clarence, agreeably to their intentions at the outset of their adventure, had, with the assistance of Gabriel, kindled three fires, south of the pine orchard, as the signal of success to the ship that lay along the shore waiting. Just at the moment when the Dominie had reached the verge of the

cliff and looked toward the moon there came forth the reverberations of cannon thrice repeated, as answers to the flame that rose from their fires. Then came up as many Roman candles burning clear, and shooting out sparks brilliant as star dust. These attracted the different classes to whom the sight of fireworks was a new thing.

By and by, when all supposed these rejoicings over for the time, lights of different colors were seen to spread from prow to stern of the ship, till she seemed to stand out upon the darkened sky, a fiery image of some terrible being, ready to mount on wings. They who were ignorant of how all that was produced stood in amazement, not unmixed with terror. The name of that vessel was one that created fear all along the river; and recent occurrences had not served to allay these fears. The Clintons, however, saw in that brilliant object, the signal of joyful enthusiasm in which the whole ship's crew united as one man.

"I can hear," said Bertram, "their hearty cheers; I am sure of it. The voices of four hundred men can be heard that short distance. There again."

"You imagine, cousin Bertram," was Clarence's cooler word. "You may as well say that you see them; but by George I do see them crowding the deck. There, take the glass and see for yourself."

"I see no men," said the sailor, who looked with a seaman's eye; "but there, I see our initials hung out in flaming characters, B. M. C."

The other companies viewed the illuminated vessel with different feelings, and it would not serve any good purpose to record these in detail. The Dominie was impatient to be gone, as the next day was the Sabbath, and he must be at his post. As many as chose to encamp for the night, had the opportunity, as the booths erected by Brandt's army still stood, and the embers still smoldered on the fireplaces, where they had been burning during the week.

"But for my part," said the stout-hearted minister, "I would rather be in my own roost beside my careful hen, than lie here under the stars high above my head, where the hawk and the eagle have their nest so near me. Let poets say what they please of such sublimities."

Grant as usual put his word in, saying: "Ane might suppose when they hear you preach, that the higher up and the nearer to that terrible crystal, the better for the health o' the spirit.

That's to say when you get into your taunt-rums."

"All true, Grant, and proper enough to be said at the right time, but I hope," and here the good man's voice quivered a little, "I hope I may die in my nest; I have no wish just at this moment to mount to heaven from this footstool. You captains must lead the men home according to your best wisdom. I shall leave my nag here for the use of the young lady; I can get one at the bottom of the hill from Hanshee Goetchius."

With this the Dominie left. Tom had been sent away an hour before with orders to go straight to the parsonage, so that all might be in readiness there for strangers. Another messenger had been sent secretly to the ship, so that nothing remained but to finish what had so far made such good progress.

"Where did you leave your master, you cowardly scoundrel," was the first salutation of the anxious Yfvrow, "that you have come skulking home like a fox that has lost its tail in a trap?"

"Leab massa!" was Tom's astonished answer. "Me neber leab massa; him leab Tom shooting de big Indian and King Cuffee. He! he! he!"

Whether it was Tom or the Dominie that shot Brandt, she could not make out to this day; but this did not prevent her ordering a couple of sheep, and fowls in proportion, to be killed, so that she might be prepared for a company, "like another Abigail," as Grant said.

#### CHAPTER XLII. TEARS AND SMILES.

TOWARDS midnight, under the guidance of Teunis, the whole party found their way to the parsonage. On the road old Martin, in the gratitude of his heart, yielded to the plea of the Tory's son; and Elsie, in the warmth of her long-cherished affection, consented to be a bride on the next day. "It would," she said, "make Miss Clinton so happy before they parted."

Agreeably to the command of the Dominie, the two maidens were put under the charge of the Yfvrow, who, with true maternal prudence, merely kissed them both, bidding them good-night in the sleeping chamber to which she conveyed them. Their sleep was that of youth and health, after undergoing perils on the heights, perils in depths, and perils in the wilderness. Weary and overcome with their exertion of body and of mind, they had sunk into a deep slumber,

which continued till the sun was far up in the heavens. Margaret dreamed all night of the dangers and of the deliverances of the past week: the one class of images mingling so with the other, it would have been difficult to have disentwined them. A prominent figure in the foreground was an eagle that grew in her sight large as a ship; its wings spreading out till they became sails, by which the vessel moved fleetly on the waves, as she had seen a sea-gull playing in a storm. On the head of the glorious creature was a brilliant jewel that glowed like a crown of bright flame. All round the points of the wings were lamps that hung like lambent fringes, and were so soft, that though she had taken a seat between these wings, the fire did not scorch her in the least, as the eagle sailed down the broad river, with Bertram on one side and Clarence on the other; guiding their ship as they might a chariot of fire on the land, which went as she willed. It was sometimes land, and then water. All at once the vessel, winged as it was, hung over the gulf below the Falls, where they found refuge. The spars seemed so fine, and the hull so transparent, that the appearance was more magical than real. The ropes were threads of yellow light, and the waving ensign a sheet of red flame as the ground on which were intermingled the lion of England among united stars. At that instant, in her sleep she heard a cry, and saw her cruel enemy near her on the height above. Here she leaped into the airy ship, and sailed away above the clouds, when the joyful sailors fired off their artillery, giving out cheers of gladness and continued huzzas.

At this moment the enraptured maiden awoke; nor was it all a dream. Some of the youthful crew outside, noisy in their mirth, Sabbath though it was, were celebrating the events which gave the elder portion of the population such pleasure.

They had succeeded in firing off a small cannon, which of itself was a great feat, and worthy of their vocal music. The two young women recovering their scattered senses, looked in each other's faces and smiled. Margaret calmly kissed her friend, as tears filled the eyes of both—tears of gratitude to God and love to one another.

"We are here, and safe," said Elsie; "let us thank the great Deliverer, and be ready for whatever else may come."

"And next to him who has delivered me, I owe all to my dear Elsie, who took her life in her

hand for me, a stranger, and the daughter of one who is the"—

"Say no more of that, Miss Clinton; there is a Providence which overrules all these events; and now that they are transpired, I would not have them in a different form than they are at this moment, though it may sound strange to you."

"Some good thing is about to happen then to my own Elsie."

"Yes, Miss Clinton, Teunis will be mine. An event I never expected to see; my father is reconciled to him, and I am as happy as a young maiden can be. All has come out of your captivity, so that I am as much released as you can be." Here Elsie hid her face on Margaret's bosom.

"That is your own good heart speaking that has cheered me so long: for it seems so long since we became known to each other, that it sounds strange to me to hear my brother say we must be at the ship to-morrow."

"Yes," said the thoughtful Elsie; "you return to your home, and I remain at mine; and our experience of trouble will not be lost, if we both fill our places the better that we have been at school up among the mountains. But, hark, there is the horn of warning to rise. There is more to be done this day than you have dreamed of; nor could you guess though you were to try all day."

The countenance of Elsie, while it retained its usual quiet soberness, was more cheerful than it had been for some time; showing that pleasant thoughts were passing over the zenith of her heaven; and yet there was no levity nor trifling demeanor. Her conversation was as lively—more lively than ever, but intermixed with sage maxims which she had heard and stored up in the past; and while the experience of the high-bred English maiden was gained in a far different school, yet the results to both at this hour were not unlike; showing that virtue is eternal and unchangeable; impressed upon the soul within, and not upon the body without.

"But," continued Elsie, "you must not suppose that my heart is any lighter, though I smile in your face this morning; like the keystone of an arch, I am firmer and stronger the heavier my responsibilities are becoming! Ha! but here is something that will interest us."

With these words the country girl drew out into the middle of the floor a strong hairy trunk, studded

with brass nails, and bound with iron, such as English travellers take with them to foreign countries. Margaret soon expressed her surprise; for it was the very chest which she herself had carefully packed with what she intended to wear on this journey to Ulster. Her wonderment was how it could possibly be on that floor, when she left it last Sabbath morning in her little cabin. Had she been told by her old Scotch nurse that some kind fairy had brought it hither, she was likely to have believed her. The truth must be told here. Bertram had secretly made a journey to the ship during the night; and this among other matters was a result of his interview with his uncle and aunt. The day was to be spent in this inland village, where in gratitude to the good man who had aided them so efficiently, and in pure friendship for Elsie, Miss Clinton was to be allowed to remain. The dresses which the chest contained were sent, so that she might appear worthy of her name and place in society. Other garments lay there folded, which were intended for the daughter of Martin Schuyler, who, as the relative of the noble man of Albany, felt as dignified as a queen, and must be arrayed that day "in as handsome a manner as becomes her standing." So the proud 'Yfrow said to her careful spouse before she went to bed that night.

The two damsels were soon into the mysteries of dressing. Elsie had worn the gown she had on the night she left Hoogenhuisen, and Margaret had not thought after being caught in her parti-colored blanket of changing it for another. Once afterwards at a masquerade in Fortheringame Castle, England, did she appear as an Indian Queen. The blanket was kept among the choicest treasures of her gay wardrobe.

At the breakfast table both the visitors were welcomed by their host and hostess; the lady giving them the warm embrace of a mother, while the Dominie with dignity and paternal voice bade them welcome, handing them at the same time to chairs by his side.

Margaret felt the blood tingling through her veins as she sat down reflecting that she was now in the presence of the man whom she had learned to respect by what she had heard of him. With all her experience of the world and of different companies, she was not without anxiety as to the result of this interview with one whose sentiments she knew must be of a high order. Forethought

was unnecessary here, as all was done in decency and order.

"You have at least been fortunate in one thing, my lady: in your late excursion in seeing our mountain at this season, for it is the only object of interest we have to show a stranger. We think it beyond all other hills."

"I have been unfortunate, my dear sir, in not being in a fit frame to enjoy it, as I would have done had fear not prevailed over my admiration; still I shall take impressions with me so deep that they never can be worn out."

"Yes, my lady, in misfortune we receive such impressions. Had you sailed over the highest peak in one of those newly invented air boats that the French are trying, your voyage would be sooner forgotten, than if you walked every step up to High Peak."

"So moralists say," was Margaret's reply. "Still a balloon would have been welcomed yesterday morning, and could I have made one I would have ventured in it."

"And fallen, lady, down the precipices, where your crushed body would have been lying now. God's ways are not our ways, neither are his thoughts our thoughts, for as the heavens are higher than the earth, so are his ways above all those inventions that human wisdom would try."

At this point Tom put down the large clasped book on the table, while at his heels there came in the whole household of this holy patriarch, taking their seats according to their rank. The ninety-second psalm was read, followed by a brief exposition and a prayer, solemn, earnest and direct. The household, the country and the church, were all remembered. What chiefly affected Margaret was the touching reference made to herself; showing that he who spoke for them, knew all about her and felt for her as a kind father does for a wandering child. As he rose in fervor he became more pointed and his voice quivered as he supplicated, "Divine compassion on the head of her, who had been chased like a young roe, among the hills, and who had been followed after by a love strong as death. Now, O Lord! may her eyes this day see Him who is fairer than the children of men, who standeth behind our wall, who looketh at the windows, showing himself through the lattice, saying, 'rise up my love, my fair one come away. For lo the winter is past, the rain is over and gone: the flowers appear

warning eye. After a little while he came out, ready to enter the sacred place; his cocked hat on, with his Geneva bands hanging low on his breast; except these, not a spot of white upon him. Over all was his ample cloak, made of thick worsted stuff imported from Holland, and sold by Abram Van Est, at Coenties Slip, Manhattan, now New York.

The 'Yfvrow, who was herself superbly dressed, made her spouse turn round till she examined him thrice over, continuing her critical investigations till he grew out of patience, and broke away from her hands in assumed fury.

"Nay, nay, Dominie, you must allow me to straighten out that wrinkle in your coat-tail, careless man that you are. Can you not lift it aside when you sit down? It is the 'Yfvrow will get all the blame. Dame Brinkeroff will say:

"Did you see the Dominie's bands? They were as yellow as a duck's foot."

"Yaw, yaw," Mammy Demond will squeal out; 'and his wig was mairs like tow on my rock than good hair.'"

"Never mind the clashing jades," said the well pleased and happy Dominie. "I'll have them all before the Consistory for their slander. You're the best wife in the colony." And with that he stole a kiss, as if in perfect exuberance of pleasure.

"Fie, fie, Dominie! and before ladies, too," said the no less happy wife, "and we going to the kerke. If old Mat Van Deusen hears of this there will be some noise."

With that all marched out to the church. The Dominie, as of right, led the way, having Miss Clinton on his arm.

#### CHAPTER XLIII. THE IMMORTAL SOUL.

It was one of those beautiful Sabbath mornings which occur at the close of the fall of the year, that resemble the face of a devout matron, just before the winter of her life commences; who, still conscious of the happy life she has passed, surrounded by her children, who revel in the fruits she has gathered for them, looks with devout gratitude to God, as sensible also of worldly delight. The sunshine of youth not only lingered around the hills, but rested richly on the valley. The people were evidently at rest in their minds, and as the clear cock-crow wakened the echoes, voices of praise were prolonged so sweetly that they reverberated from stream and knoll, till all sounded in blessed unison.

VOL. IX.—29

After the stirring events of the past week, a large congregation were assembling. The majority came for worship, but many to obtain the news of how the good cause was prospering. Where every one contributed his part, each carried away a full account, to be told over at home, to those who could not come to the common gathering place.

The strangers present, guests of the Dominie, sat in his large square pew, along with the 'Yfvrow and her little flock. As they looked up to the desk, and saw the pastor in his full Geneva cloak and bands, admiration filled their minds. Spreading out his hands, he said:

"The Lord bless you, and keep you; the Lord make his face to shine upon you, and be gracious to you. The Lord lift up his countenance upon you, and give you peace: Amen."

He read the commandments in a slow, solemn voice; varying his tone as he went through each, so that the ear of his auditors might receive the separate precept by itself, and ponder upon it with prayer, and in meekness.

Here he sat down, when the clerk, who was placed in a smaller pulpit below the high desk, rose and gave out a psalm, which he led in a tone between singing and chanting. Horridly grating to refined ears; but the people were pleased, and paid to Zach Goetchius twenty shillings and ten cheepens of corn for serving as Presentor. Zach also read the lessons from Scripture. The prayers were in part from a liturgy in the Dutch language, and in part extemporaneous English; which the transient worshippers supposed was in deference to them, as well as for their edification.

The same might have been said of the sermon. It was intended by the preacher, when he began, to be in English, but as he grew warm, he branched off into the vernacular tongue. This more especially when he wished to give something very terse or hitting, or which might be disagreeable to his new auditors; for he wished them to carry away a good impression. His side strokes were the spiciest. Bertram who had been in Holland, gave these afterward to his friends. He, moreover, declared that the style of speech was as pure as the doctors of Leyden used.

The text, which was pronounced in a clear deliberate voice, had the effect of quickening the ears of the assembly, who leaned forward to catch every word; and from the stillness which succeeded the announcement, as well as the curiosity

on their countenances, they seemed to say, "What can the Dominie have to say from that?"

"I knew a man in Christ, above fourteen years ago—whether in the body I cannot tell; or whether out of the body I cannot tell; God knoweth—such an one caught up to the third heaven . . . and heard unspeakable words, which it is not lawful for a man to utter."

He began, "I knew a man yesterday who was up on the mountain, and as near to the third heaven as any man in this region can be; and from Paul's experience, and that of this other man, we deduce the sound doctrine that the Great Spirit communicates with the soul of his creatures, through nature and grace; and consequently you have spiritual and immortal souls, as well as you have decaying bodies."

"Keep that doctrine before your view, all through; for though I will say a vast deal before I be done, it is all on this foundation."

At this point the preacher went minutely into the history and the meaning of his text; telling his hearers that it was a page taken out of the private journal of Paul's autobiography: "We could wish he had left more of the same kind; but we shall see the other parts when we get to heaven. It would seem that fourteen years before this time, and twelve years after he met the Lord by the way to Damascus, when the Apostle was in the prime of life, and after having had large experience of holy visions, he had this one, that transcended them all in matchless glory; and which even he, great as he was in the use of words, could not express."

"Others as well as Paul have had visions. There was Ezekiel, who was caught away from the banks of Chebar by a lock of his hair, and placed at the door of the temple of Jerusalem: there again was the exile of Patmos; and with humility be it spoken, there was I myself on the mountain, when I felt like one transported out of the body, as I looked out upon the river, the woods, the fields, and the mountains far off on all sides; so that though I have come to declare my feelings before you, I find them to be unspeakable; at this moment I am sincerely sorry that I have chosen this subject. O Divine Spirit! thou who taught Paul to speak right words, indite for thy feeble servant, and make his tongue like the pen of a ready writer."

At the close of this introduction he paused, blowing his nose, looking round at the same time

to see that all were in their places and quiet, and then in a formal, pointed, and emphatic manner, gave out his first point:

"God communicates with the human soul above nature, and in an inconceivable way."

There followed this enunciation of his main point, a long rambling talk, in which it was plainly seen to the initiated in extempore speaking, that he was struggling through the mist.

"I am not," said he, "a Paul, mind you; I am not supernaturally endowed. But, after all, Paul was human, and he could have sympathized with me up there, as I am humbly sure I could have felt with him further up. He had a sense of the beautifully divine, as I have now of the divinely beautiful. Such a speechless delight is in us all. We feel more than we can comprehend; we understand more than we can tell. When I was up on the side of the mountain, I could not help looking down on the different men whom I knew dwelt here below. I said, there is one, and he never sees anything beyond his line fence. When he looks out on the stream that runs through his farm, he wishes it were a mill stream; another is always calculating on the loads of hay he will cut from that meadow; one more sees a flock of sheep, and it is of the wool and the mutton he is thinking. These men are but a little way removed above the brutes they feed. If I had them up here I would say, 'Were God to give me the power, brother Paulus, brother Johannus, brother Jacobus, brother Petrus, receive thy sight, and be filled with the Holy Geest.' And I am sure that I would enjoy the surprise which all these brothers would show when the scales made of milledoleors, of wheat, of flesh, and of blacks, would fall from their eyes: and the glorious kiverlid would be spread out, and their eyes made clear enough to see it, with all its colors and patches of wood—with its border of blue sky, and its centre of meadow-land, through which the silken stream runs so pure that it reminds one of the stream that maketh glad the city of the Lord after a storm has shaken the earth."

"Brethren," said the good man, now becoming more earnest, "your eyes must be unscaled if you would see with the spirit, and see with the understanding also. You could not penetrate the thick mist of a fall morning, but you could believe that snugly resting under it there are happy homes, and that above it there is clear sunshine. Roll away the cloud, and all is beautiful and sublime. The

beauty was there all the time. So the spirit of faith can see the throne of God, and the dwellings of the blessed, unchangeably the same in their everlasting radiance.

"Some of you cannot understand these things. How can you, having never seen them? You are blinded by your milledoleors, and your grain, and your blacks. But shall my horse Dick, that was up there with me, and looked out snuffing at the fresh grass below, say that there was nothing down there but grass, when your dog Watch wags his tail at the sight of a hare? Or shall horse and dog say there is nothing more than they see, when Paulus and the rest see the fine farms in the Bught? And how dare Jacobus and his friends, who see nothing but farm-land, presume to say that the gentleman sitting there in my pew did not see beauties beneath all these visible things? And, finally, shall the gentleman in my pew deny but I had a more penetrating view of God below these fancied things, which made him leap with rapture? I am sure, after these things, you will allow that St. Paul, even in the body, might hear sounds unspeakable in the third heavens."

Here the venerable pastor paused, wiping his face with his Indian bandana, of which he was a little vain, as one might judge from the manner in which he spread it out, lifting it softly in his big hand before he pushed it down into his big pocket. By that time he was into the mysteries of thought, and was launching out into the scriptural doctrine of divine communications with the soul out of the body. He quoted liberally from Scripture, placing himself on safe ground.

"But, my brethren, do we not see, and feel, and guess at things, after seeing a great sight like what I saw, even when we cannot put the ends together? I went out in my body over a bridge that hung across the gulf, till I could not move another step; and then I looked down till my eyes dazzled, and then my spirit crossed still beyond, till even my spirit sank, having no ground to stand upon. Who shall hold me up? There must be an arch broken. Where is the power to rebuild it? My imagination is away off—my dreams show me a country I am afraid to enter when I am awake. I am, while in my study, sometimes eager to see my Maker. I cry, Oh, that I knew where I might find him. Behold, I go forward, but he is not there; and backward, but I cannot perceive him. Why is all this? I am a sinner; but there may be in me some frag-

ments of a broken sense, which, like the pieces of the Yfvrow's looking-glass that Betty let fall, still showed bits of her black face. Like some great men I have read of, she tried to join the parts, but after she had done her best, it was a fractured mirror, reflecting only glimpses of light. Who shall mend this broken spiritual glass? That glass of the Yfvrow must be melted over and renewed. God can renew the spirit of the mind. He can build up the broken arch, over which the spirit can pass safe and sound, so that the eye, not satisfied with seeing, nor the ear with hearing, may behold the face of the Maker, and the man become fit to hold fellowship with Him. Oh, ye men, put the milledoleors from off your eyes, your houses and your lands, your orchards and your cider-presses, with all: and ye vrows must get your spiritual looking-glasses mended, and made bright as your silver, else you will never see on the other side of your milk-pans."

The faithful pastor found it necessary to make these familiar illustrations of a very abstract subject, and it was doubtful even then if he made it plain to the limited understanding of his regular hearers. But on this occasion he knew that he had some of the *élite* before him, and he was not unwilling to show them that he had learned something at Leyden. Still, some of the old women there could not help saying, with admiration, "What a wonderful man our Dominie is!"

He went on: "You know, brethren, there is a difference in tastes; there is Tim has a taste for good eating, and there is Egbert has a taste for a fine book, and there is Wilhelmus has a taste for praying. When they told me that the cloud at Pine Orchard showed the faces and the figures of those who who looked into it, I could not help thinking how differently these three men would come from seeing it. The glutton would start like a beast away from it and feed the next hour; the man of mind would be for giving reasons from the nature of things; but the good man and the true, would look through all, and see that hand which turned the wheel behind. What of the three men—the glutton, the thinker, and the praying soul? The first man is but an animal, the second is a reasonable creature, but the last is a spiritual being allied to the Great Spirit.

"To me, men and brethren, those sights and sounds are foretastes of the heavenly and of the divine. They are full of meaning; eye hath not

seen it, neither hath ear heard it. It is not possible to utter it. They are unlike any other blessedness here in this world. Yet they are not beyond human experience, as Paul testifies, as I can testify; and as some of these old mothers there can assure you who are in doubt. The mountain top, to the man whose vision is purified, is another round in the ladder, down on which the angels descend in their visits to us, and up which we may ascend in our visits to them; hearken van nu aan zult gij den hemel zien geopend, ende engelen Gods opklimmende en nederdalende op dem zoon des menschen. Oh, dear me! what am I saying now? I forgot," said the fervent preacher, "but the English is, Verily, verily I say unto you, hereafter ye shall see heaven open and the angels of God ascending and descending upon the Son of Man."

A fashionable congregation would have felt that time enough had been spent, but these people were accustomed to sit their full two and three hours patiently, sleeping or looking through vacancy, to be roused up as their pastor got up himself. This day he was in the happiest mood, and having an appreciating audience he gave them full measure. He drew a long breath, and gave out another main point which he said was deduced from the preceding: that since the soul could hold communication with the Maker either in the body through nature, or out of the body, through pure spirit, it followed that the soul was itself spiritual and immortal.

He dwelt at least ten minutes here in giving scriptural proof of this, which could not fail having good effect on the honest believers before him. But getting his eye on the strangers again, he launched away upon the abstract, in what he meant to be forcible eloquence. Said he, "Listen to the word of Paul in one place: 'Father of Spirits.' We are his children still; he begot our souls. Do you not feel that you are his children? I felt it yesterday as I stood gazing down into the deep profound, where I could see nothing, save the unknown; and as I mused, I thought what if I should step out into that space; where should I fall? On the bosom of my God, my Father! We who have been at sea, looking from the stern with eyes fixed on the vessel's track till we lost ourselves, have felt it. There never was a horizon yet that we did not wish to fly beyond! What are these longings but the conflicts kept up between the earthly and the

heavenly; what but the instincts of the child longing for the bosom, from which it has been rudely torn by some foul tyrant—the returning fragments of a broken dream of yore—the strains of a broken harp-string recalled to the ear of memory, where they have long lain disconnected through violence?"

Here the preacher entered with great force and unction into the power which the Gospel has of healing this breach between the child and the parent. "The first Adam lost his place and we in him, but the second Adam is the Son of God and we are renewed in him. The spiritual flame expired, is now rekindled and burns as it is replenished from that fountain."

The discourse was drawing to a close, and the preacher, like a strong racer, was gathering himself up for his final spring. "It is," said he, "fearfully true of many here, that they have no interest in all that I have said this day. I can read it in your faces. Had all of you been up beside me, where I felt myself rising as on eagle's wings, some here that I wot of, would have said: 'I wish I were in my own barn, over a good roast turkey!' and one or two here I see, are thinking now of the pot of silver hidden in the garden. Oh, you are a carnally-minded crew, and would not be happy had you all these things at once. You need not smile, ye youngsters there; as for you, my young colts may serve as examples of the uneasy restlessness of your hearts, when they leap out of the clover into the sorrel. Can you tell me the cause of all this changeableness? Your souls are spiritual, and long for communion out of the body; and cannot be fed on good dinners, nor grow on a thousand acres of the best land in the world.

"You have been expecting something else here this morning. I want to show you that there is another and a greater cause, than even our country's cause. I saw when I commenced, that your ears were cocked up to hear of battles; but there is a great battle to be fought by every one for himself, when the last enemy appears on the field, and by the way of preparing you to meet him effectually, so as to come off conqueror, I have lifted you up into the third heavens. You expected me to tell you of the wonderful advantage we have gained in the north, and I have been thinking, 'Want wat baat het een mensch zoo hij de gehele wereld gewint, en lijde schade zijner zeile. Of wat zal een mensch geven, tot lossing van zijne zeile.'

You that understand English only will find it in Matthew 16: 26: 'What shall it profit a man if he gain the whole world and lose his soul.' My heart is full of sorrow when I think of these things. Let us sing:

Oh, were I like a feathered dove,  
Soon would I stretch my wings,  
And fly, and make a long remove,  
From all these restless things:  
  
Let me to some wild desert go;  
And find a peaceful home,  
Where storms of malice never blow;  
'Temptations never come."

CHAPTER XLIV.—"THE CONSUMMATION DEVOUTLY  
TO BE WISHED."

THUS the usual services were concluded, the congregation preparing to make a rush for the door, and were standing up, the men with hands on their hats, and the women adjusting their trains, paying but little attention to the desk, expecting only the well-known words of benediction, when to the amazement of all, young and old, the Dominie said in a firm, clear voice:

"The congregation will be seated while the solemn and interesting ceremony of marriage is being performed. The parties will stand up and present themselves before the altar."

Here Teunis Roe and Elsie Schuyler took the specified place; Bertram at the same time taking the place assigned by custom to the groomsmen, and Margaret that of the bridesmaid. Martinus Schuyler moved slowly out of the Consistory's pew, to the side where his daughter stood; the mother, attempting to do the same, was prevented through her emotion, so that she merely leaned forward in her pew, in the act of inward prayer.

All of these arrangements were completed before the assembly had wakened out of their astonishment. When they did perceive them, whispers might be heard among the elder portions: "The Whig has yielded at last to the young Tory." The young men were hiding their mortification by winks and smiles, while one louder than the others gave utterance to his feelings: "She was always a haughty heifer; Teunis will have his own task in breaking her in."

Grant, who sat in the front of the gallery enjoying the whole scene, for Teunis had become, after what had lately taken place, a great favorite with the Scot, here felt mad at the ill-concealed envy he saw around him and had the greatest difficulty

in holding himself within due bounds, whispered aloud:

"Sit doon, you haverils that you are. Do you no see true love gettin' its reward?"

"A hemp neckcloth would be more like the young traitor's wizzen," some one here bitterly said.

"Whist! whist! I tell you!" said Grant, still louder, "or I'll fling your yellow carcase over the laft there."

By this time the minister had opened at the place in his book where the "form for the confirmation of marriage before the church" is contained, and began in a full, firm voice to read. Being himself a great admirer of that ancient liturgy, he believed that all his people must be, so he never omitted aught of the good service. As he said in the morning so he showed at noon: "Martin Schuyler's daughter must not be slighted."

The good man's heart was so full that it surged over, so that there were no triflers there by the time he lifted his hands over the newly-married pair, giving them truly his blessing.

Nevertheless, that all, male and female, were affected even to tears, Elsie's bridal attire did not escape the scrutiny of those watery eyes. Had it been such as they knew her to possess, and that in which they had seen her before, there would have been but little said; but since it was well known that Hoogenhuisen was in ashes, it became at once a question with a hundred mothers and maidens, "where have all these fine silks and laces come from?"

That was a secret known but to the 'Yfrow. The moment she became acquainted with the intentions of the young people, her wits were set to work without even consulting the bride herself, who had no other prospect than that of appearing at the altar in very common attire. Lizzie Schuyler, the daughter of the general, and the affianced spouse of the gallant Hamilton, being at the very time on a visit to her aunt, at the Manor of Livingston, close by, was the very person to supply all deficiencies. The hint was enough for the busy 'Yfrow. A messenger brought back a choice of dresses, such as would have decked a queen. Elsie felt somewhat displeased at the officiousness of her well-meaning hostess; but her present circumstances compelled her to comply. Of course all the parish were ignorant of the good genii that had furnished these ornaments; but they were

none the less objects of marvel to every one present, possessed or not possessed of the critical skill of the milliner.

"An' vere did Anshela's dochter get all tese fine tings, budten?" said Peggy van Steenberg to a visitor then in the country for her health, as some said; others because New York red-coats were too enticing; "vere did tese vain tings kaam into dis lan'?"

"You up here in the country have not seen all the fine things in the world, though you may have the highest mountains at your elbow," was the half jesting reply of the New York damsel.

"Vy, have'n ve grand tings? Is'n de 'Yfvrow a great voman once, an' her uncle de Skipper? Budt dere vas de gown like sky, on de summer afternoon; beneat it, de vite petticoat, clean as de snow packed wid de rain ven de vrost comes and make de glitter."

"Oh, Peggy, let me tell you that is all the fashion now; a celestial blue satin gown and a white satin petticoat shows all below. Did you not see how they were trimmed with stripes of the same color up the edges?"

"Yaw, yaw; but de corsets vas vat mine eyes beheld; yallow and crossed wid de blue stripes. Budt do tell me all about dere head. Awee! how Elsie did look on her."

"Oh," said the initiated lady, "the head-dress was a *pouf* of gauze, made like a globe; and you saw how the hair was curled, so that it fell in ringlets down each side of her neck."

"Awee! awee! vat a time it must tak'n for ou to tell it so: now, vat about de neck?"

"Oh, the neck! She had on her a thin gauze handkerchief that looks like the snow on a frosty morning. You saw that it hung full, at the edges trimmed with the richest Brussels lace."

"Awee! awee!" was all that Peggy could say, in perfect admiration; but whether at the wonderful dress, or at the wonderful eloquence of her companion, could not be distinctly known. However, not being tired of what she affected to deplore, she listened with increased admiration to the city lady, who went on to tell her the meaning of those mysteries which Margaret had on.

"You saw that other lady. She is English, I know, from the rose on her cheek and the blue in her eye. How beautifully she rose up and stood. Your country lass has a fine figure, no doubt; and the gown fitted her very well, only an inch too

tight all over; but, then, that other one is slender and quick in her movements without seeming to know it."

"Elsie Schuyler," said Peggy, "can stan' wid de best; vat of de oder one's gown?"

"Oh, that's what they call a perriot, made of gray Indian taffeta. You saw it had dark stripes of the same color with two collars—the one yellow and the other white; both of them trimmed with blue silk fringe."

They went on in this way, and we must let them, and return back to the church, which was not dismissed when these two came out. At the close of the service alluded to, a note was put into the hand of the Dominie, as he was about to dismiss the people, which ran thus:

"REV. SIR:

"If there be no impediment in the way, we wish to engage your services at present, for the same purpose as our friends now made happy by you. BERTRAM CLINTON.

"P. S.—We prefer being married with a ring."

The good man smiled assent, saying, with a cunning eye, as he looked around:

"Another marriage service to be gone through; all who are tired may now leave."

He knew very well that curiosity was at too high a pitch to allow any one to go out; but he sat down, more for the purpose of considering within himself than for anything else.

"Let the parties desirous of entering the holy state of matrimony come forward." Here Bertram and Margaret stood up, with Teunis and Elsie on either side, supported by Clarence. At the same instant, and while the arrangements were going forward, there stepped up through the middle aisle a man and woman, muffled in large cloaks, taking a place behind the bridegroom and bride. The house had been so crowded, no one had observed them till that moment, and all were taken so with surprise that every pulse ceased. The Dominie almost stumbled at the beginning of the service.

However, he proceeded as before, with the additional part of the ring, which being out of the line of a Dutch minister, was handled somewhat awkwardly by him; but remembering what he had seen in England, he was not entirely ignorant.

The closing prayer was this time improvised. The good man's heart was too full to follow any form, and throwing his soul into his words, he

uttered himself, so that tears fell from eyes unused to weeping.

"O Lord God of our fathers, bless these parties, in their basket and in their store, in their soul and in their body. Make them a blessing to the church, to the world, and to each other. May every thread of roughening earthliness be disentwined from the connecting bond; so that between themselves it may be soft as divine love, and yet strong and inseverable as that which unites the saints to one Lord; in one faith, in one baptism, and one marriage, till all four be presented, without spot or wrinkle, in the presence of God, at the marriage supper of the Lamb in the New Jerusalem, where love and righteousness only reign. Amen."

The Amen was responded to in a clear, full voice by the stranger, who stood up behind the parties along with a female muffled in a veil that fell low to her waist. The sound of the Amen startled the whole house, not excepting the Dominie himself; for it rung like the word of command heard at the head of a regiment. And by the time the audience had recovered from their amazement, the new bride had turned and flung herself into the open arms of the unknown woman, merely saying, Mother! but so piercingly that it thrilled through the soul, as if Nature herself spoke by human lips. Margaret's transport was so great that all began to fear for the effect of that joy. The cup became suddenly full and surged over, so that she became for the time unconscious of happiness or of grief.

The stranger, vigorous and resolute, in a moment lifted the fragile creature, pale as a lily, in his arms, walking through the aisle with a step that clanged on the floor, making every one hold his breath, till he reached the door, where a vehicle stood ready, into which he put the unconscious bride, mounting himself with a bound up to the seat, saying at the same time, "drive briskly." Two other wagons drove away the rest of the party, including Teunis and Elsie. The swooning and over-happy Margaret soon recovered her joyous smiling face, so that by the time they came in sight of the river and the ship, she was weeping anew, in thought of parting from her dear deliverer. They took a warm embrace and then another, waving adieu till the vessel was out of sight.

The explanation of these sudden transformations is easy by him that understandeth. When Teunis told the 'Yfrow of his good luck with Martin, and

of their intentions for the morning, that careful lady said:

"Who will be your bridesman? Do you think the young lady would stand with Elsie?"

There were difficulties unforeseen by the young Dutchman, but his counsellor was equal to the occasion, so rising up she said:

"Go your ways, and engage the young gentleman for your side, I will see the other side supported."

This hint was taken by Teunis, who made Clarence his friend. The thought darted through the young heroic brother's mind, "Why not make both parties happy, so finishing what has been worked for so hard by Bertram?"

It only required his earnest voice and warm heart, to plead for his cousin, and the thing was done. He told the whole story of Elsie's self-sacrifice and devotion to Margaret, so that nothing could be refused to her or to her friends.

"I promised," said the knight to Bertram, "on the eve of that miserable attack, that if Margaret could be recovered, their hands should be joined. I shall keep my word of honor; only, Georgiana, we must go up in disguise. This pass from our cousin George Clinton, will carry us safely through."

And as the Dominie said afterwards, "he came, and saw, and yielded."

A short time after the events recorded in the preceding history had transpired, and before the wonder was entirely past, the Dominie was sitting in his study when Tom entered, followed by Unga, the deformed child of Dora. He stood in the middle of the room puffing out his breath, while his head rose up, and as it fell he drew in the surrounding air, so that the spectator could imagine that he saw a swirl, like a small whirlpool, around the strange creature.

"What now, you limb of Sathanus," said the student of Leyden, lifting up his eyes from a large Latin folio that he was amusing himself with. "What news from the realms of darkness?"

"Please your reverence," said Tom, in a very low manner, "Unga hab someting frob the high'd legions to 'municate frob de prince ob de air an' powers."

"'Prince of the power of the air.' You fool, quote the Scripture correctly and go out with you, for I see that you want to know all about Unga's message; but begone."

Unga's head rose a few inches higher, and was

followed by an eldritch scream, out of doors, that made the minister's man run to see what was the cause. In the meantime the Dwarf put a package into the hand of the Dominie, sitting down himself as if he were at home. The letter ran thus:

"REVERENDISSIMO DOMINO: When we last met in my retreat, we parted scarcely agreeing in our opinions concerning that particular Providence which you Calvinists believe in. Occurrences which have lately taken place, have gone to convince me, whatever Calvin would say were he in your place, that no plan is ever carried through agreeably to that laid down by its architect. Were I going to preach to you, as you have held forth to me, it would be from the words of our immortal bard, a man, though you may not allow it, equal to Calvin:

There's a Divinity that shapes our ends,  
Rough hew them as we may.

"I have been marking out my timber, and hewing it like the great King Solomon in the wilderness, deeming all the time that my fabric was coming to perfection, when to my amazement I found that the tools I was using rose up against me, and have carried out a purpose not of my own invention.

"You have pronounced me to be a double-sided man; and if appearances were to be your ground of judgment, I am many-sided; but in the face of all those signs, I have had one ruling passion—REVENGE.

"I tell you now freely I sought to be revenged on Sir Henry Clinton, because he favored my enemy; but my design on him was only a step toward the depth of my purpose—the deep damnation of Clifford.

"I have lived these two years past for nothing else. I found my way to the presence of Washington, obtained a commission in the secret service, took up my quarters at the foot of your mountain, on the lines between the contending armies, assumed characters that were obnoxious to me—wizard, spook, hermit—anything that would further my fell purpose—REVENGE. All kinds of

persons were taken into my service; forgetful as I became, that every man and woman, as well as I, had a mind of their own, and a purpose of their own to carry out, which could not in all parts harmonize with mine. Yet I went on planning, as if they were passive instruments, moulded after my wisdom and for my ends.

"I found out my mistake; that villain Kiska-taam, whom I employed to decoy Clifford here, by offering to abduct the knight's daughter, had *vengeance* of his own that he sought to visit on the head of Sir Henry Clinton; and while carrying that out, another passion for her took possession of his bosom, disappointing me of my expectations of retaining her under my guardianship, as a punishment upon her father and future surety for myself.

"Nor did I succeed better through my agent Elsie; one of another and of a nobler nature. By degrees she was winning upon my own affections, and I shall not now avow all that was in my heart concerning her. One thing I was certain of for the time, when I found that Miss Clinton had fallen into her hand, that all was at my disposal; but the high-minded mountain maid was too direct in her purpose to be led into any labyrinth of mine. What you were pleased to designate as 'theatrical' could not be understood by her in her exceeding truthfulness; and I was prevented from taking possession of the person of Miss Clinton entirely through her determination of purpose. All came within an ace of an utter failure. I have just escaped being caught in my own craftiness, and the villain Clifford has only received a part of his punishment.

"REVENGE burns still in my breast, and must till the vow recorded in heaven be fulfilled. I am off, prowling like the wolf, round Fort Niagara; and woe to my victim, should he leave that place of refuge. His blood only can cool this malignant fire that burns, *burns* for REVENGE.

"I am, Reverendissimo Domino,

"Your admirer,

"S. C."

## BEGUILED—A STRANGE HISTORY.

BY WARREN WALTERS.

## IN TWO PARTS.—PART II.

WITH wide-eyed surprise Leila listened to this outspoken admiration for herself, and endeavored to apply the plummet of self-examination, and see how near she came to the standard of this man's ideal.

Had Dorcas Brosius been an observer instead of a dreamer, she would have asked herself the meaning of Francois Faber's stealthy, covert glances at her niece, and perhaps have questioned the meaning of the subtle study he made of the changing expression on her face.

"Thy brother must have been deceived by thy letters; there is naught in me to call forth such words," meekly said the fair girl, as the blushes were rippling from her cheek to their hiding-place.

"I cannot call your remark modest, since modesty presupposes the knowledge of some personal charm which the possessor disclaims or represses. I see that you are perfectly ignorant of your attraction in person or speech to men who, like my brother and myself, have lived in the garish light of a fashionable world." Seeing that the sweet face was again brilliant with blushes, he explained: "Miss Brosius, if you measure my words by the standard of compliments, you do me great injustice. I would be ashamed to utter such bold and indelicate flattery; but when one states facts, plain words would best befit them. I hold it no less a fact to describe this spotless lily as beautifully pure, as to speak of you as possessing the charm of innocence. It is as absurd to flatter this fragrant bloom, as to style the statement of self-evident facts about an unconscious human being society compliment. You can have no idea what a fresh, invigorating presence you carry with you to an *ennuied* man like me; it is as exhilarating and grateful as the breath from the ocean, or an inhalation of the spicery of the woods."

During more than half of this monologue the speaker had his eyes closed, and did not observe the effect on the young girl. When at last he ceased, he raised the lids, and noticing the almost painful embarrassment of one of his audience, sprang to his feet, and exclaimed:

"Heedless maunderer that I am! my speech has given you pain, and that of all things I would spare you. I have driven you away," he continued, seeing her about to leave. "Forgive me, ere you go!"

"Forgiveness is not necessary where no harm has been meant. Thee wilt not again so speak."

With many earnest words and promises, Francois followed her to the gate; his words were pathetically humble.

When next they gathered in the artist's room, every sign of cloud had disappeared. She had wondered if the portrait would still be in the same place, and, with a sense of gratification, she observed it standing in the same spot; only now some rich-hued hangings had been disposed about it in the form of a canopy, which greatly heightened the effect. Francois led them into the room, and narrowly scanned her face. He saw the exultant glance come across her retina, while one of triumph came over his. This time the talk ran lightly on various matters but for a short period, when Francois dexterously introduced the portrait, and there the converse anchored until the sitting was over. Yesterday the young painter had sung the praises of his fair subject; to-day he chanted pæans in honor of the far-distant brother. Yesterday it had been a monologue, to-day it was a dialogue; then it was flames of modesty which covered her cheek, now it was the torch of excitement. Amid the stream of anecdote, incident, and narrative which poured from his lips, Francois often sought the young girl's face, and out of the corner of his eye seemed to exult at her growing enthusiasm. She plied him with question upon question, to which he gave answer in the most passionless voice; and before either was aware that the time had passed so rapidly, Dorcas returned long enough from her revery to call the hour which measured the extent of the "sitting."

A week later another meeting occurred, the picture having advanced rapidly towards completion. Leila took her accustomed place, but manifested no little uneasiness, apparently unnoticed by the

artist. At length she asked permission to change her seat, and the alteration was made. With a meaning smile, Francois observed that in her new position she could command a view of the portrait, which had been placed out of range of her line of sight. An observer would almost have been persuaded, from the expression on the painter's face, that he had designedly shifted its position. The painting after that incident went along smoothly, and although Francois endeavored to introduce the old subject, Leila would take no part or lot in the matter. He allowed some surprise to creep upon his face, which we who are looking behind the canvas can see, and which the same canvas hides from Leila. Here his craft was at fault, and instead of wondering thereat, he might have predicted it days before. He gave a few strokes more, with contracted brow, and then, with a brightened face, said:

"Oh, Miss Brosius, I thought to tempt you to listen to my gossip about my brother in order to fill a little commission he gave me. But you seem to take no interest in the theme to-day, thus making my task more difficult."

"Thou hast heard again from thy brother?" she asked, in joyful surprise.

"Yes, in truth, I have; and he has, moreover, sent you a souvenir," slowly enunciated the young man.

The blushes came rushing to her cheek, and in a moment she had forgotten the resolution of the previous day to suppress all conversation about the stranger, as she eagerly exclaimed:

"Why hast thou kept it back until now?"

With a strange laugh, Francois averred:

"You gave me no opportunity. As I before said, I was endeavoring to 'lead up to the subject' as the writers say. Excuse me until I get your package."

Leila once more alone (for one could hardly say of Dorcas Brosius that she was part of the company) was alternately remorseful and elated, and in consequence more than miserable. What could she do? Her natural instinct resembled a magnet. Positively, she would receive the gift; negatively, repel it. So between the two powers she was distracted. She turned at last in her desperation to the portrait, and the sunny smile on the painted canvas was so assuring and so gentle, that the positive arm of her mental magnet overpowered the other, and by the time Francois returned all

qualms had been removed. The package, untied and unwrapped, disclosed a superb copy of Shakspeare, bound in panels of iridescent seashells and heavy dead gold ornaments. Besides this was a bracelet of coral and a cameo pin of rare workmanship. Her eyes glistened as she noted their exquisite beauty and the changing lights on the mother-of-pearl. Wrapt in an examination of their lovely colors, no thoughts of their value obtruded. Meanwhile the artist worked rapidly upon his picture.

A partial reaction of the negative pole began to assert itself after she became more accustomed to their beauty, and in almost childlike accents she asked:

"What beautiful things! Am I to keep them?"

"Most certainly. Bertram sent them as souvenirs. The shells and corals were gathered by himself, as as he has gathered hundreds of others." Here the expression on her face changed, and disappointment gathered in her eyes, which the next sentence drove away. "But, he writes, 'these were the most exquisite of all, and selected especially for you.' The cameo is, as you can see, very skillfully wrought. It is a Beatrice; the background, bust, and prison-bars are all cut from one stone, each of the three divisions representing a different strata."

The next sitting and the last was three weeks later, and not even then was Leila to see the picture upon which Francois Faber was engaged. In the interval, Leila has sent over to the mansion a dainty little note of thanks to Bertram Faber, and had in reply received one from Francois, stating that the note had been enclosed that day to his brother.

The three weeks of leisure, Leila had resolved, were to be devoted mainly to the art of staying away from the Faber residence, and the drowning of Bertram Faber in the waters of Lethe. Miss Dorcas, had she known the cause of her charge's whimsies and violence, would have turned parliamentarian, and insisted on striking out the word Lethe and substituting therefor the Stygian waver. Leila was a revelation, and a trying one, to Miss Dorcas during those three weeks. The revelation was not a matter of steady growth, but of fits and starts; it was cumulative besides; that is to say, the spasms were each in turn more surprising, and excited the interior peace of the placid old soul with more violence. The last sennight had de-

stroyed the fair fabric of her visions, and every one knows what it is to have one's castles tumbling about their ears, even though that castle be of airy masonry and mystic joinery. It was now twice six working and one Lord's day since her imagination had uninterruptedly and duceltly played under her pepper-and-salt curls. Twice six secular days and one sacred day, because the visions of the latter were decorously religious, and instead of rioting among worldly silks, army and naval officers, and brown-stone fronts, they reveled in Solomon's temple, fine needlework, pomegranates, wealthy Centurions, and Scribes and Pharisees. It is not easy to convey a just idea of Leila's methods and madness, for it was so petty and nervous. But then it was Leila Brosius, the calm, sweet-voiced Leila; and that made all the difference imaginable. The ring-dove scolding in parrot's plumes was quite as uncomfortable as the parrot wearing the claws and beak of an eagle. Indeed, matters were so disenchanting that the guardian meditated flight and a return of her charge to paternal arms. Before this course was decided upon, the atmosphere brightened a little, and the last sitting came about. That was a memorable day for the aunt. During that operation she had actually indulged in an eminently satisfactory seance.

Once in the atelier, she considered herself relieved from duty until the time for retiring came. The aunt was simplicity itself, although in a widely different sense of qualification than when the word was applied to her niece. Francois, with subtle craft, had metaphorically closed her eyes and stopped her ears. He had charmed wisely. At the very time the sentinel should have been most on guard and alert, by some species of reasoning best known to herself, she tacitly turned over her post to the enemy. Leila had a dim perception of this rank treason, and resenting it, in the same sort of blind unreason, had vented her temper upon the confiding Dorcas. Of course, she was not so constituted as to see all this clearly, but had it been reasoned out, her aunt's dereliction and her own dissatisfaction with herself would have been discovered as the mainspring of the conduct toward that good lady.

Francois saw signals of a perturbed mind in his "subject," and had the magic mirror whereof we read in fairy tales been held before him, and the secret workings of his heart or intellect presented,

the reader might have observed a little thrill of joy running through the cardiacal region. Considerable changes had been made in the room, some new articles of furniture had taken the place of those present on former occasions, and the quiet curtains which once had depended in careless grace from the embayed windows were now replaced with more brilliant colors. But what was more noticeable to Leila was the absence of Bertram's portrait. She made a detour of the room with wistful eyes, but there was no suggestion of its presence. The curtains were drawn back as far as possible, and the sunlight came tiding in with great waves on all sides. The chamber seemed almost metamorphosed by the sunlight glare, which touched with boldness every recess and object therein. Leila shifted uneasily on her chair, and conversation seemed to lag. Still the artist painted on unconsciously, and the fair girl becoming less and less at her ease, until at last, with the faintest quiver in her voice, she asked, "Hast thou destroyed thy brother's likeness?"

Before the words were all uttered she regretted the speech, as she saw the artist's emotionless eye rest upon her face as if reading her inmost soul, and then with steady pupil range the room in search of the portrait.

"I presume William has removed it to another room. I had not noticed the vacant spot," he nonchalantly answered, and then went coolly on painting.

Leila was in torture, and the very effort she made to calm her excited nerves only aggravated the matter. The portrait was the point upon which she had fixed her attention, and even when conversation was brisk, the picture strangely held it. She had studied every line and touch of the brush until it was familiar; every stroke and tint communicated its peculiar and characteristic trait. It had become necessary to her peace of mind, as the nearest approach to the living person.

"Something annoys you, Miss Brosius; can I do anything to make you more at ease?" politely asked the artist.

Had Leila spoken the words uppermost in her mind, she would have called for the return of the portrait, but she contented herself by asking that the curtains be drawn closer. This done, the painting went on as silently as before, the artist apparently engrossed in his work. In Leila's mind a struggle was in progress, and after a lapse of

some moments she ended it by asking for the portrait after this fashion :

"I am almost ashamed to ask thee to grant a favor, but I have been so accustomed to seeing thy brother's face opposite me, that I am actually uncomfortable without it!"

Ring the bell at once, he ordered the servant who answered to bring down the portrait, and smilingly addressed his "subject:"

"Ah, you have found him good company! I can take that as a compliment to my work, since in his own person he is a rare companion. I most certainly have reason to be proud of it, and I only hope the portrait upon which I am now engaged will be half as true to life as that of Bertram's."

The servant returned, bringing with him the easel and canvas.

"Now, Miss Brosius, have it placed as you like," quietly said the artist. The troubled look lifted from her face, and she bade the man place it in its old position. After it was disposed to her liking, the servant threw back the curtains, and Leila, with eyes aglow, gave it a satisfied glance. An astonished look and quick pallor came over the young girl's face as she exclaimed, with so much vehemence that Dorcas tumbled from her lofty castles to common earth: "What hast thou done to thy brother's face?" and leaving her fauteuil she advanced rapidly to the easel to unravel the mystery.

Both artist and aunt vacated their seats, warned by the anguish plainly noticeable in the exclamation. He answered:

"I never dreamed that yours was an artist's eye, Miss Brosius, and could so soon detect a touch or two of the brush. There," he explained, "I have repaired the mischief," as with several rapid strokes he restored the expression to the picture. The little interjection which escaped Leila, as she returned to her chair, was mingled grief, joy and chagrin.

"Oh!"

Francois, turning to his work, gave a pedantic explanation of the matter. The veriest touch from his brush, a trifling movement of the spot of white in the eye, the depression of one eyelid, and a downward curve at the corner of the lips in place of the upward, had brought about the metamorphosis. At length he dilated upon the *limbus luteus*, the contraction of the *obicularis palpebrarum*, and the muscles of the mouth. This was all

very dreary for Leila. She stood it as long as possible, and then broke out with:

"Why didst thou spoil my picture, Mr. Faber?" for she felt an ownership in the portrait.

"Miss Brosius, I thought to perfect the likeness; there was something about it not quite true to life, and I thought to experiment with the face; I almost flattered myself that I had succeeded."

"Succeeded! Why thy brush wronged thy brother's whole nature; the cruel, mocking eyes, and the evil mouth, calledst thou that improvement?" hotly answered the maiden.

"You have seen my brother, then?"

The excited glare died at once out of her eyes, and abashed, she cowered back in her chair. "It was true," she thought, "I never have seen this man; it is not for me to say what is like and unlike him. Foolish girl that I am, what snares I have wound about my path! What should I care if Francois Faber does despite to my cherished fancies? And yet I *do* care. I have formed an affection for a man whom I know not. He has grown dearer than all else to me, though I have seen but his painted semblance. Around my every idea and hope Bertram Faber is entwined." These and a thousand other thoughts crowded through her brain before she answered.

"Thee knowest I have not seen him with the eye of flesh; thy rebuke is meet." Passionately she continued, "And yet, even then, how could you destroy Bertram Faber's face with thy hateful brush?"

"You are equally unfortunate in your second attack, Miss Brosius. You cannot criticise what you have not seen, much less call in question the right of a artist to guide his brush as fancy chooses." This was spoken with a laughing face, but there was also an infusion of sarcasm in the tone. Leila looked up astonished at this, the first rude speech from the artist's lips. It was as a dash of cold water to her bearing, and made her once more assume the mild, humble mein of her mother's people. Very meekly she replied:

"Friend Faber, thee hast done well to quell my unruly speech."

So divinely meek was this speech, and endorsed as it was by the drooped eyelids, the dimpling of the cheek, as well as the exchange of the spirited pose of the head for one of abashed submission, that Francois deeply regretted his cruel speech, and resuming his most gracious manner, talked in

a brilliant, confiding way of that one subject so dear to her.

The sitting ended; Francois invited them back that day week to have their first view of the portrait. Leila's manner during the week had veered to another point of the compass. *Now* she would be alone, much to Aunt Dorcas's relief. In the quiet of her chamber, she took up Shakspeare, and reveled in that treasure-trove. There she found words to suit her passion, and delighted in all the forms of ardent emotions. There were times in which she was depressed, and bitterly denounced herself for having given reins to her feeling, and cruelly scourged and mortified her love. What an abyss had she fallen into? Why had she allowed herself to think of Bertram, and listen to his praises! Perhaps she would never see him, never, never, never! The agony of this thought was unendurable, and vainly she wished her mother back that she might pillow her head upon her breast, and pour out her soul. She imagined the words in which she would confide all, and in what glowing phrases she would depict the object of her passion. In this last thought she forgot her grief and fears, for she had a thousand ways in which to picture his speech and carriage.

A brighter morning than that on which Leila and Dorcas visited the Faber mansion seldom shone. A flakeless sky, and a breezy air, full of vigor and elasticity, and the vegetation glittering in the sun from the morning's shower, all conspired to render the walk enjoyable. Leila was in brighter spirits than she had been. The exercise had deepened the tint on her cheek, as the air had given radiance to her eyes. Francois met them at the door in spirits equally lively. Evidently he had given especial attention to his dress, and from some cause, a bright flush mounted his cheeks. Gaily he led them to the atelier, and placed them where best they could see his work. He withdrew the covering, and watched the faces of his critics. A gratified blush crimsoned Leila's cheek as she saw the picture before her. "Could she really be as fair to look upon as that canvas?" she mused. Her mirror told no such tale! What would Bertram think of her could he see this? Would Francois copy it and send it to his brother—the brother who had been so lavish in praise of an unseen maiden? It was also a period of supreme enjoyment to the artist as he noted the effect of the portrait upon the two women. He had given

his best efforts to the work, and he felt well repaid for his labor by the evident admiration visible on the faces of his visitors. Leila glanced from one canvas to the other; side by side these pictures stood, and this thought she could not repress: "Shall we ever stand thus together in real life—thou and I?"

After some conversation, the situation grew embarrassing. The business of their visit was over, and it did not seem exactly proper to leave at once, and yet what was there else to be done than bid the young painter adieu; and after an awkward sentence or two, they left the house.

The afternoon following, Leila was startled by the approach of a servant from the Faber mansion, and a feeling that some catastrophe had occurred. He bore a message from his master, asking Leila to call that evening. The messenger went on to say also that Francois was not expected to live much longer, having sustained a fatal injury by falling down a ravine during one of his midnight rambles. He had been found there the next morning insensible, and a doctor from the city at once summoned, who warned the patient that his tenure of life was exceedingly short. A carriage came for Leila before dusk, and she, with Dorcas, were driven rapidly to the house. On their way the driver informed them that his master was slowly sinking, and that Dr. Dracol was of the opinion that the vital spark would soon be extinguished. They were met by the doctor, and ushered into the chamber of death. No sooner were they in the chamber, than Francois asked all to leave the room but Leila, and all but she silently withdrew. Francois was suffering no pain, but was apparently very weak. He motioned her to sit down at a chair by the bedside, and with his face turned from hers, began to speak rapidly, as if conscious that the time for him was short:

"Leila Brosius, I have sent for you to undo mischief and a great wrong I have done you. The doctor says I have but a short time to live, and I want to undo some of my work. Your pure sweet face attracted me from the first, but it is only lately that I knew I loved you supremely. I shall not ask you whether that love is returned, for I could not bear to hear your answer, and yet why should it make any difference? A little while and it will not matter one way or the other. Let me say for myself that I had no idea of the wrong I was doing, and that it brought with it its own

punishment." Turning his head toward the weeping girl, he gave her a piercing look, and asked, "Can you bear a sudden sorrow? You must prepare yourself to receive a dagger into your heart, driven home by the hand of one you thought a friend; I am a murderer, and yet I meant no harm. I was fascinated with the study of psychology, and read and studied all writers on the subject. I was likewise a skilled anatomist, and my nerves were hardened in dissecting rooms. I sought to find out the wonders of those secrets, the passions and the nerves. The first day I saw you, the tempter came to me and suggested the trial on you of some of my theories. I meant you no harm, nor did I ever think that evil would come of it. I thought no more of it than I would of the cleavage of a crystal, or the analysis of a chemical compound. It was only at the last sitting that my eyes were opened, and I sought to undo my sin. I was awakened to the knowledge of it by the discovery of the love I had for you, which was changing my old habits, and had life been granted me, I might have undone it all. I say that the passion for you, and your sweet speech and gentle manners opened my eyes, and I saw the evil sown by me eating into your life. I then resolved to work backward and remove the canker-spot, but this accident has come between me and my purpose. I have no brother," he gasped.

Leila's face grew pale; she trembled from head to foot, and the hot tears ceased to roll from her eyes. He motioned for wine, and with shaking hand she poured out and handed him the glass. After it was swallowed, he continued: "You were so innocent, so guileless, and so different from all others, that I yielded to the tempter and prepared that portrait, sitting up at night to embody in its expression and features the idea of a noble man, one whose thoughts were pure, and whose life was without guile. I wanted to see what effect the presence of such a face would have upon you, because you were, I thought, so susceptible and innocent. I followed up that by constant references to the qualities and manners of the man. Up stairs in my room, you will find the 'syllabus' as it were of his character, the soul with which I endowed a canvas portrait. To make this was far harder than to paint the picture. You will now recall all my little designs and tricks to interest you in a person who had no existence. Believe me, Leila, I had no thought of entangling your

soul. The cursed curiosity of my nature led me into the experiment; the cost of it to you I never counted; I thought to amuse myself, and you as well. Can you, oh, Leila, the purest one of all earth's daughters, can you forgive me?" He waited a moment, looked into her now staring eyes, and then repeated the question, to which she answered:

"Francois Faber, thou didst lie to me, and lead my soul astray."

"This is my punishment—to go down to hell, unforgiven! Was it not enough that I saw my own burning love swallowed up in the very experiment I made? You loved my creation, and not the creator of it. Had I foreseen it, never would the evil one have persuaded me do aught. And yet, Leila, loved one, I swear to you that I never meant you harm. I have digged a pit for another, and fallen therein myself. I did not mean to touch you with even so much as the shadow of pain. I am innocent. Will you not forgive me? For I have loved you truly; and as soon as I saw you in the toils I turned me about to withdraw your lily-white heart from the pit. Oh, how I have repented me of my sin! Leila, I loved you—oh, I loved you with a love that never was known to man! Give me, by your touch, by a spoken word, your forgiveness!"

The agony of this speech, and the anguish of soul, drew Leila's thoughts from herself, and her eyes melted with divine pity. She clasped his hand, and brokenly whispered:

"Francois, I *do* forgive you; seek One higher than I." Tears fell rapidly from her eyes, and one or two fell upon his hand. He started, and looked at her face, and saw from whence the hot baptism had fallen, and an ecstatic glow filled his eyes, as he drew her towards him, and gently whispered:

"Leila, my darling, I know you have forgiven me. Think of me sometimes. I have given you everything I own; just do what you will with it; do good with it. I know you will. Keep something of mine specially to remind you of one who loved much, and suffered much. Good-by, Leila; good-by, darling." Even as she put her trembling lips to his forehead, and her arm about his neck, to lift him, if possible, to an easier position, his spirit fled, leaving on his face the sunny smile that had so charmed her when in life.

Years have gone by since then, and but yester-

day I saw the placid face of Leila Brosius, with her pure white and pink complexion, going about on an errand of mercy. It was Leila Brosius in spite of the Quaker garb, and a gentle step instead of a springing one; while in her eyes one could see an ineffable peace, begotten of some deep anguish. Her name has not been blazoned about, but the money of Francois Faber, in her hands, has compassed and brightened scenes of squalor, of poverty and despair; an asylum for "Magdalenes" is her special care, and Francois Faber's

name is to be found on the marble slab over the entrance, just under the words, "He loved much; he suffered much." In Leila's room are two pictures, whose history she never tells; and hidden away in a bureau drawer are a volume of Shakespeare, bound beautifully in mother-of-pearl and dead gold, a coral bracelet, a cameo, and a handsome opal.

Where'er her troubled path may be,  
The Lord's sweet pity with her go;  
The outward, wayward life we see;  
The hidden springs we may not know.

## THE FASCINATION OF A FASHIONABLE IDEA.

BY LEONIDAS.

It seems to be the tendency of the popular mind to run into extremes with regard to nearly all subjects. The middle way, spite of the classical axiom which declares it to be the safest, is very rarely, or never, the popular way. There is a perennial charm in exaggeration, which fascinates us in the face of our better judgment. The inevitable outcome of this lax practice is a sort of pendulum motion in the currents of thought and opinion—a lack of stability and certainty as to any matter whatever, and a habit of following the fashion of the day in matters of thought and speculation as mechanically as we do with regard to ceremony and costume—just as if fact and truth, like "leather and prunella," were mere conventional things. The Great Muscular Idea, with which certain of our fiction writers and popular lecturers have been so industriously indoctrinating the American people for some dozen years past, offers a fair illustration of the tendency to which we allude. We are taught to look upon muscle, and bone, and nerve, and sinew as the types of all conceivable excellencies in the heroes depicted for our admiration—and, by inference, of course, to regard the absence of these anatomical analogues as evidence of inferiority or insignificance. Now, granted that to be strong is a very good thing, it does not follow that muscular strength is necessarily or even generally conjoined with any other kind of strength whatever.

A generation or so back the popular idea inclined the other way. Then, in the days of our boyhood, it was the slender, delicate, limp, fallow, "intel-

lectual-looking" man, with the bare Byronic throat flanked by the voluminous shirt collar, who was the personification of genius and "all the talents." This sort of idea, moreover, had prevailed for a long time, and it seems to have reached a stereotyped form in the days of Dr. Watts, who in replying to some observations on his diminutive stature, is said to have improvised the well-known verse:

Were I so tall to reach the pole,  
And mete the ocean with my span,  
I must be measured by my soul;  
The mind's the standard of the man.

The world endorsed the sentiment of the worthy doctor's quatrain, and the fictionists and orators of his days, and of days long after, did the same, as any one may see who will take the trouble to look but cursorily over the "circulating" literature of the closing of the last and opening of the present century. The old idea and the new one are, we think, both equally wanting in any solid basis—both are pendulum notions, equally distant from the plumb-line of truth—the new muscular one being just a centripetal swing back again, an inevitable reaction from the old one. That both notions are mischievous there can be no doubt: the old one led many weak minds to asceticism, and others to reckless dissipation; and the new one is productive of consequences just as evil.

We hear complaints from time to time to the effect that our Universities, the great national establishments for the education of the intellect, are in danger of becoming mere training-grounds for the body; and it is said that of late years they

have turned out a far greater number of accomplished athletes than of accomplished scholars—that rowing, running, and leaping are preferred to the classics, and the Tripos is postponed in favor of football, pitching the bar, and other favorite exercises. What truth there is in the libel we do not pretend to say; there is, however, one ugly consequence of the furor for muscularity which marks the rising men among the upper classes, which one must be blind not to recognize, and which grows more repulsive and more formidable every year; and that is, the spread of the love of sport, as it is absurdly called, among all classes of the population. There might be little harm in sport, if sport were what the term implies—innocent amusement and excitement; but in the present day, sport is but another name for gambling, unless it is also another name for cruelty. No trial of strength or endurance can now publicly take place, but immediately there is betting all through the country as to the result, and in cases where the competition is long delayed, it shall happen that hundreds of thousands of dollars are lost and won. What does this mean? It means that, in instances a hundred times more numerous than ever come to light, the bettors have staked and lost money that was not their own, or, being their own, should have been applied in the maintenance of their families. But this is partly a digression; let us return to the question of strength.

What is bodily strength? Is it strength to do, or strength to endure—and what sort of relation is there between the two kinds of strength? We know a blind man, miserably poor, the very twin brother of privation, and nearly seventy years old; he is about five feet three in height, and bent out of shape by the fire which burned out his eyes nearly threescore years ago; for the last forty or more years he has groped through the streets in all seasons at all hours; and for nearly all that time his principal ailments have been fainting from exhaustion. Is he a strong man? No, for he could barely lift a hundred-weight from the ground. Yes, for he has outlived hardships under which the majority of living men would have succumbed. Again: Some forty years ago, the writer sat at the desk in an office in company with two others, W— and D—. W— was an invalid, much below the middle size, of a pale, bloodless countenance, and generally suffering in health. D—, tall and robust, was the picture of

manly health, vigor and cheerfulness; he excelled in feats of strength, and could walk about freely with weights to the amount of a quarter of a ton hung about him. At fifty-five, D— began to break down, aged rapidly in the following three or four years, and died in a state of decrepitude at sixty-one. W— retained his post until he was approaching seventy, then retired and bought an annuity, and still lives to enjoy it, though he cannot be far from fourscore. Which of these was the strong man? *Strong*, you perceive, is a rather vague term when you come to consider the different senses in which it may be used. There is strength to do, and there is strength to endure, and it is not at all evident that the relation between the two strengths is of a very intimate kind; indeed, so far as our experience goes, it points rather to the contrary.

The navy is strong; he is held up by his admirers as the type of muscular strength; so are the puddlers, casters, and platemakers of the Black country; one is amazed at the bodily strength these men will exercise for hours together. But nothing is more certain than that they do not last longer than men of ordinary power, while in general they break down earlier, and are not so strong at threescore as ordinary workers are at the same period of life—which, moreover, few of them, comparatively reach. It would seem to be the case that the human frame can put forth but a definite amount of force in a lifetime, and that the man who draws too frequently or extravagantly on this reserved fund really squanders his life, and like other spendthrifts, must suffer the penalty of exhaustion. The existence of some such law as this is fairly inferable from facts open to us all. We see around us persons who, having husbanded their strength in youth and manhood, lead healthy and comfortable lives in their old age, and live on and on, year after year, and lustre after lustre, while many younger, and to all appearance stronger men, drop and fall and die. What is it, too, that makes women on the average so much longer-lived than men? What, but their calmer and more tranquil modes of life, their relatively passionless existence and freedom from fierce excitement, and both mental and muscular stress?

Then, as to intelligence and general physical power. Is it true, as the muscular missionaries have so long been trying to persuade us, that it is the strong in body who is strong in mind—that

muscular and mental power are correlatives? We do not think it. Robert Hall, the most powerful orator, and one of the most correct thinkers of this century, was never a strong man in the muscular sense; and though he might be called a big man, it is well known that his bulk was his burden, and was due to disease. Heine, the famous German poet, was a little man, puny in person, all his life a weakling, and during his latter years, when he produced some of his finest works, was bedridden and totally helpless. Alexander Pope was notoriously feeble and infirm, and grew almost decrepit in middle life. Keats and Shelley were both men of feeble constitution; so was Nelson; and the same might be said of many others who have done some of the best work in the world, and left their mark on their age. On the other hand, the men of powerful physique, such as Goethe, Johnson, Scott, Wilson, and others, have played as prominent a part and achieved as lasting reputation. So that there is no proof that any kind of relation exists between the intellectual and corporal strengths. Fools and philosophers, as all the world knows, are not distinguishable by stature and brawn and muscle; but both are to

be found, and always have been found, among all varieties of size and constitution and bodily qualities. In one respect we believe it is true that the man of huge and powerful frame shows to greater advantage than he of small and slender proportions—but the advantage is a moral and not a mental one; the large, powerful man (perhaps by a kindly provision of nature) is generally, and that even among the rough and least civilized classes, a being of gentle and forbearing temper, and, as a rule, far more ready to assist and oblige than to take offence—while traits of character the reverse of these are too often observable in persons of feeble frame and puny stature. This is all.

If the above observations are just, then the Great Muscular Notion is after all nothing better than a deceptive exaggeration. Let the comely bodily frame, and all health-giving, manly exercises, receive the admiration and encouragement that are due to them; but do not let it be thought that, wanting muscular development with breadth of chest and length of limb, a man is therefore lacking in any of the essentials either of manliness or capacity.

### WINTER'S HOPE.

THE Autumn days are gone—all flown;  
The yellow leaves from off the trees  
Are shed, with sad and doleful moan  
Of whistling wind and mournful breeze.

The cumbered earth bears far and near  
Those saddening signs of autumn's death;  
And leafless forests, moist and drear,  
Oppress us with their chilly breath.

But let us look around once more—  
Is there no beam to cheer our sight?  
No rift in these dark clouds? Ah! sure,  
We are not left without *some* light?

No; 'tis not so! E'en while we gaze,  
See, from yon hill the red sun rise,  
Illuming with his cheering rays  
The earth that all so darkly lies.

And in deserted hedgerow springs  
The hawthorne berry, brave and bright;  
While perched atop the robin sings  
His clear, sweet song with all his might.

Our life will come to autumn hours,  
And all may chill and dreary seem,  
But even then we'll find some flowers,  
And even then some joyous beam.

### THE MISSING SHIP.

RIGHT gallantly, that morning hour,  
From harbor she sailed forth;  
Five hundred sunny hearts on board,  
A thousand bales of worth—

A little kingdom on the sea,  
A little heaven of hopes,  
And whistled merrily the winds,  
And seamen at the ropes.

Oh, what a picture gallery  
Was in those wooden walls!  
Each man was painting out his dream  
Of woods and waterfalls.

VOL. IX.—30

Of corn-fields bowing to the sun;  
Of kine on sweet green sward;  
These were to be, across the sea,  
And he of all, the lord!

No wonder 'twas, though hard to part  
From all beloved of yore,  
That such a shout rang from the ship,  
And such a shout from shore!

They went. They're gone from mortal ken,  
God only knoweth where;  
Full many a fathom deep, perchance,  
Each with his dream so fair.

## NOTES AND QUERIES.

**Strange Coincidences in Dates.**—In an article lately given by us on "Curious Links," we illustrated the advantages conferred so widely upon society and the world by the connections between and the incidents of human life; as if an overruling decree of fate and destiny had settled the whole affair for us, without leaving us the power of setting it aside. It will be found, on further examination, that this idea is especially marked in connection with sovereigns, princes, and great personages generally, more particularly in the years of their birth, accession, deposition, and death. With such as are superstitious these coincidences will have weight.

One singular mode of fishing out the connection (for a fishing it certainly is in many cases) consists in adding up the digits or numerals in a particular date, and comparing this sum with the date itself. Thus, the year 1876 is expressed by four digits (one, eight, seven, six), the sum of which amounts to twenty-two; and the "fishing" would consist in catching any peculiar relation or connection between twenty-two and 1876. The French have taxed their ingenuity greatly in this kind of thing, with results which are less curious if nothing more.

Take, for instance, some of the French sovereigns who flourished several centuries ago. The *crochet-mongers* have discovered, in four cases, at any rate, a numerical connection between the order of succession on the one hand, and on the other the sum of the digits in special dates rendered memorable by noteworthy events in the lives of the respective sovereigns. Louis IX. was born in 1215; the sum of these digits is nine. Charles VII. was born in 1402; the sum of these digits is seven. Louis XII. was born in 1461; the sum of these digits is twelve. Lastly, Louis XIV. was crowned in 1643, a date the digits of which sum up to fourteen. In regard to an intermediate sovereign, Louis XIII., the accumulation of coincidences (so to speak) is very curious. We must first remind the reader that in the old court language of France, "Louis" was spelled "Loys;" that this king's French, Christian and surnames were "Loys de Bourbon," and that those of his queen were "Anne d'Autriche." The figures came out thus: Louis XIII. married Anne of Austria in 1615; the sum of these four digits is thirteen. "Loys de Bourbon" comprises thirteen letters, and so does "Anne d'Autriche." The boy-king and girl-princess were each thirteen years old at the time of the marriage; he was the thirteenth Louis of France, and she the thirteenth Anne of Austria.

Come we now to the nineteenth century, with which mystical Frenchmen have been equally busy. Bourbonists, Bonapartists, Orleanists, Republicans—all are cited to supply materials for the same story. The great French Revolution, which brought so many momentous events in its train, began in 1789; the sum of these four digits is twenty-five, which, added to 1789, brings us to 1814, the year when the Emperor Napoleon went captive to Elba, and ceased his European conquests—although there was destined to be one more year

of struggle on the battle-field. When Charles X. was deposed in 1830, a contest arose concerning his successor; some politicians wished for the appointment of another Bourbon, while others preferred Louis Philippe, Duke of Orleans, as a representative monarch or "citizen king." The Chamber of Deputies decided on the latter by two hundred and twenty-one votes against one hundred and eighty-one. The Bourbonists sustained a defeat; but they solaced themselves by pointing out that by expressing the numbers in words instead of figures, and taking the alphabetical order of the letters in the words, they could prove two hundred and twenty-one to mean "La queue de Robespierre," while one hundred and eighty-one meant "Les Honnêtes Gens." We have not quite succeeded in realizing this bit of reckoning ourselves; but the Bourbonists very much relished the idea of proving their adherents to be "virtuous or honorable persons," while their opponents were merely "the tail of Robespierre."

We have had a little of this sort of thing in England, and possibly a due exercise of ingenuity might convert the little into much. Charles I.'s son, and eventual successor, was born in 1630; the sum of these digits is ten, which brings us to 1640, the year when the short Parliament began to make short work of the kingly power. Again, the sum of the digits in 1640 is eleven, which brings us to 1651, the year when the battle of Worcester drove Charles II. into exile. One more instance: George I. ascended the British throne in 1714, which added to thirteen, the sum of its digits, makes 1727, the date of his death.

But apart from, and in addition to, these numerical conundrums involving the summing up of digits, there are many associations of particular years with certain persons, families and dynasties. The year 1809 was marked by the death of Haydn and the birth of Mendelssohn; the sum of these digits (availing ourselves of one more illustration of this class) is eighteen, which, added to 1809, brings us to 1827, the year marked by the death of another great composer, Beethoven.

The year '88 is associated with a train of events, none of them cheerful in character, concerning the House of Stuart. For instance, in 1388, Robert II., first Stuart king of Scots, became little more than a nominal sovereign in the hands of the nobles, and died two years afterwards; in 1488 James III. of Scotland was murdered; close to the ominous '88, but really in 1587, the beautiful, erring, hapless Mary, Queen of Scots, was beheaded; in 1688 the last Stuart king of Great Britain, James II. (James VII. of Scotland) was dethroned; and in 1788 Charles Edward Stuart, who had been known forty years previously as the Young Pretender (the "Bonnie Prince Charlie" of the romancists and balladists), died in a foreign land, unhonored and almost uncared for. In eleven years another '88 will come; is there another Stuart anywhere to come under a cloud in that year?

In some instances one particular month in the year, and

one particular day of that month, are claimed by the believers in the star of destiny as being associated with one particular personage of note. Destiny or no destiny, it is a fact that the 24th of February was thus associated with the Emperor Charles V., the 2d of December with the late Emperor Napoleon III., the 14th of May with Henri Quatre, and the 13th of October with King Otho of Greece. In the dreadful religious wars of the sixteenth century in France, Huguenots massacred Catholics in Bearn on the 25th of August in one year, and Catholics massacred Huguenots on the 25th of August three years afterwards. The stern Puritan and the gay monarch who had so much to do with the moulding of English history during the seventeenth century, had each his particular association with one special day in the year—Oliver Cromwell with the 3d of September, and Charles II. with the 29th of May.

A crochet has been started (we do not know by whom) to the effect that the number three is peculiarly stamped on the royal dynasties of England; that after three sovereigns of any one dynasty, either a revolution takes place, or a passing of the royal sceptre to a collateral line. It is certainly the case that the House of Blois came in under Stephen, in virtue of his father's marriage with a daughter of William the Conqueror; that Edward II. was dethroned; that Lady Jane Grey, through her relations and adherents, made an attempt to gain the throne; that Cromwell made a gap in the Stuart line; that James II. was driven out; and that the House of Hanover came in on the lapse of issue to the House of Orange and to the Protestant branches of the Stuarts—these are admitted facts; but nevertheless we must confess to have failed in an attempt to reconcile other known events in English history with this number three theory.

**Curiosities of Wills.**—An English newspaper, the *Newcastle Chronicle*, contributes to the list of curiosities of wills: "Some years ago an English gentleman bequeathed to his two daughters their weight in £1 bank notes. The eldest daughter got £51,200 and the younger £57,344. Here is a singular bequest by a French gentleman. It may truly be styled 'A New Way to Pay Old Debts.' Vaugeois, the famous French grammarian, was in the receipt of several pensions, but so prodigal was he in his liberalities that he not only always remained poor, but was rarely out of debt. His will contains much that is original, but the following is an especially characteristic clause. After disposing of all the little he possessed to meet the claims of his creditors, he adds: 'Still, as it may be found that even after the sale of my library and effects these funds will not suffice to pay my debts, the only means I can think of to meet them is that my body should be sold to the surgeons on the best terms that can be obtained, and the product applied, as far as it will go, towards the liquidation of any sums it may be found I still owe. I have been of very little service to society while I lived, I shall be glad if I can thus become of any use after I am dead.' Whether the creditors accepted this well-intentioned bequest in part satisfaction of their claims is not recorded. The following is an extract from the will of John Hylett Stow, proved in 1781: 'I hereby direct my executors to lay out five guineas in the purchase of a picture of the viper biting the benevolent hand of the person who saved him from per-

ishing in the snow, if the same can be bought for the money; and that they do, in memory of me, present it to —, Esq., a king's counsel, whereby he may have frequent opportunities of contemplating on it, and, by a comparison between that and his own virtue, be able to form a certain judgment which is best and most profitable, a grateful remembrance of past friendship and almost parental regard, or ingratitude and insolence. This I direct to be presented to him in lieu of a legacy of three thousand pounds I had by former will, now revoked and burned, left him.'"

**A Quaint Legend of the Rainbow.**—According to popular belief in Germany, the extremities of a rainbow always touch streams, whence it draws water by means of two large golden dishes. That is why it rains for three days after the appearance of a rainbow, because the water must fall again on the earth. Whoever arrives at the right moment on the spot where the rainbow is drinking, can take possession of the golden dish, which reflects all the colors of the rainbow; but if nobody is there, the dishes are again drawn up into the clouds. Some say that the rainbow always lets a dish fall. This once happened at Reutlingen, in Suabia. It broke in several pieces, but the finder received a hundred gulden for it. At Tübingen, people used to run to the end of the rainbow, which appeared to be resting over the Neckar or the Steinach, to secure the golden dish. Usually it is considered wrong to sell the dish, which ought to be kept as an heir-loom in the family, for it brings good luck. A shepherd in the Suabian Alps once found such a dish, and he never afterwards lost a sheep. An unfortunate native of Heubach, who sold the treasure at a high price, was struck dumb on the spot. Small round gold coins, marked with a cross or star, are frequently found in Suabia, and the peasants declare that these were manufactured from the rainbow dishes by the Romans when they invaded Germany. In the Black Forest the rainbow uses a golden goblet, which is afterwards dropped. A shoe thrown into a rainbow comes back filled with gold. The Servians have a theory that passing beneath a rainbow changes the sex.

When a double rainbow is seen, Suabian peasants say that the devil would like to imitate the rainbow, but he cannot succeed. The Esthonians called the rainbow "the thunder-god's sickle."

A theory existed in the Middle Ages that the rainbow would cease to appear a certain number of years before the Last Judgment, and Hugo von Trimber, in an old German poem, mentions forty years as the prescribed time.

**A Curious Harp.**—The harp has in all ages been associated with love, romance and knightly sway, and while kings and queens have been touched by its power as the magician's wand, the peasant and lowly of the earth have found themselves spell-bound by its enchanting influence. Curious indeed is the power of music on animated creation everywhere.

The weird notes and wild desultory strains produced by the power of the wind on the stretched chords of the Æolian harp, are the delight of the sentimental and romantic, and hence this really charming though unscientific music has come to be spoken of in rather a disrespectful manner. Yet

who that has set half dozing on the rustic lounge of some vine-clad summer temple, and listened to the confused sounds of buzzing insects, trilling birds, the soft rustle of the leaves, and the sweet vibrations of the rustic-cased *Æolian* harp fastened within the trellised casement, as the gentle zephyrs played upon its strings, or that has lain and listened to the loud, wild music of its chords during the long watches of some boisterous night, will not say that its music is at once deliciously dreamy and soothing, inspiriting and wonderfully touching? As a musical instrument of very ancient origin, it carries with it certain poetical associations which render it a pleasant addition to the household, the tastes of which are educated to admire and love those things which lead

"From nature up to nature's God."

This instrument, whose music is not awakened by scientific art, but through the agency of natural powers—the "breath of the zephyr," "the voice of the wind," sweeping over strung cords, simply fastened in a case secured to the window, or in some tree or arbor—sends forth sounds, first low and sweet, and soothing as the song of the spirits which are said to sing the lullaby of the gentle babe; or changing anon to deep resonant chords, whose volume rises and swells, and, with trembling reverberations, sweeps over the strings like the wail of some sad soul chanting a requiem or the "Deus misereatur;" or again suddenly changing, as the wild winds lull, quick, staccato notes and lively dancing strains are thrown upon the breeze, and resound with loud and joyous music that the tinkling feet of *Terpsichore* would seem to have inspired.

Such is the music of the *Æolian* harp; and many a house is never without one or more in certain windows, or fastened to tree or rustic building out upon the grounds. The cases for these harps may be either extremely simple or elaborately elegant; but for the dwelling, we would recommend a pretty pine-wood case, adorned with spray-work, cutting a monogram for each side, with tracery of ferns and sprays, and a border of ivy leaves. Or, making a walnut case, decalcomanie designs may be effectively applied; or whitewood with paintings in India ink and sepia, or oil or water color, will be charming; while, for outside use, rustic ornaments are most appropriate, and form lovely objects.

The pictures from Egyptian vases and other ancient designs, as mythological characters, figures from books of travel, taken from relics, etc., ancient Grecian, Chinese, and Japanese art, with borders of curious conventional, vegetables, and animal forms, will form proper embellishments for such cases, which should be made as follows: Measure the breadth of the window, or other position destined for it, and make a pine case to fit it in length, five inches wide, four inches deep, and of quarter-inch stuff. On the extremities of the top, glue two pieces of oak wood, about half an inch and a quarter of an inch thick, for bridges, to which the strings are to be fixed; into one of these fix seven pegs, such as are used for piano strings, into the other fasten the same number of brass pins, and to these fasten one end of the graduated strings, made of catgut, such as are used for guitar and violin strings, and twist the other end round the pegs.

Within the box at each end glue two pieces of beech, or

other such wood, about an inch square and the width of the box, on which to rest the sounding board—a thin board with a hole cut in the centre; place over the top another thin board, supported on four pegs, and about three inches from the sounding board, to procure a free passage of air over the strings.

Where possible, affix the harp in the window having another window opposite to it. When exposed to a current of air, and the strings are attuned in unison with the varying force of the current the melody changes from soft low sounds and diatonic scales to wild but delightful and harmonious notes. Hidden in some grotto or shady nook, the effect of its sweet sounds are peculiarly delightful.

The gourd of the South African bushman is a sort of complicated jewsharp, in which a quill is distended by the string of a bow, and is breathed upon by the player. A gut string is attached at one end to one extremity of the bow, and the other to an oval-shaped piece of bustard quill, which is lashed to the other extremity of the bow. The quill is of an attenuated oval shape, and its quality, as well as the tension of the string, determines its musical tone. The performer holds the bow nearly horizontally, steadying himself by placing his elbows on his knees, his right forefinger into his right ear, and the forefinger of his left hand into his nostrils. He is then ready for duty. He breathes upon the quill, eliciting tones both in expiration and inspiration.

The instrument is the most ingenious to be found in South Africa, and is a great favorite with the people, though monotonous and weak in tone. The string adds resonance to the tones, which are like those of a jewsharp, though inferior to the latter.

It seems that no regular time is attempted, but the variations of tone follow each other much as when a person unskilled in the jewsharp elicits sounds of various pitch by changing the position of his lips and the strength of his breathing.

When the instrument is used by a woman, she holds it differently; grasping the middle and holding the instrument perpendicularly, she blows upon the quill and taps the string with a small stick. When the woman plays, it is called a *joum-joum*.

## CURRENT MEMORANDA.

**Glimpses at National Events.**—As we survey the past, the present, and make reckonings for the future, there is much to give encouragement to the American people.

The great conflict between capital and labor, it is true, goes on, but by the peaceful and political power embodied in the ballot; open rebellion against constitutional authority has been suppressed, and quietude and submission to "the powers that be" are witnessed in all parts of the Union. New factors on the great political chessboard are the chief attractions among politicians. Not that the new order of things is equally welcomed by all, but that place and power so long held within their grasp are likely soon to know many of them no more. The Labor Party, "of the people, and for the people," from insignificant beginnings, already assumes giant proportions, and bids fair to force the two old organizations into the background, if it should not entirely obliterate both. It would seem as if the fiat had already gone out, for Ohio has spoken with no uncertain sound, and from all present indications, other States will go with the swelling tides. *Now* we see some of the fruits of the strike; *then* we read only of the coming revolution with incredulity.

In national affairs, Congress attracts the attention of the people. Honorable Samuel J. Randall is again Speaker of the House by an overwhelming majority. Of course this result was clearly foreshadowed since the contest assumed anything like tangible shape. It was well, therefore, that his vote was made to mean no uncertain deliverance on the fidelity of the party to the majesty of the law. In point of fitness for the high trust, he is quite the equal of any of his able competitors, and his pledge, given in returning his acknowledgments to the caucus for the honor conferred upon him, that "I will, in administering the high office to which I am called, endeavor to do my full duty to my country," has the flavor of the days when the statesman and not the partisan ruled in the councils of the nation.

It is rarely that a Congress convenes under surroundings so peculiar. Not only does the nation call for important laws to mitigate the financial distress of the people, but it demands of its representatives service for the country instead of for parties, as in times past. It demands statesmanship in lieu of partisanship; the nation's weal in place of individual aggrandizement. It calls for a purification of the ballot-box in order that it may now, henceforth and forever proclaim *the true voice* of the people, and not the mandate of political mountebanks. Policy and expediency must give way to truth and justice. The people, who are the conservators of both civil and religious liberty, will take good care in the future to guard and defend the priceless heritages committed to their keeping. It shall be our province to chronicle the records made by those to whom power has been delegated.

In the West General Miles has won laurels by his skill and daring. Joseph, the Chief of the Nez Percés, is now a prisoner in the hands of our Government, and the trouble with these Indians is brought to a close. The Apache Indians have also surrendered, as shown in the following despatch:

*To General Townsend, Washington, D. C.:*

The following is just received from General Pope: "Three chiefs and one hundred and eighty-seven Apaches have surrendered at Wingate, and their arms and horses will be taken from them. Others are expected, and probably the whole band of Warm Spring Apaches will soon do likewise. I have ordered them sent, dismounted and disarmed, to their agency, at Canada Almosa, for the present. I will communicate in a few days my opinion as to the best final disposition to be made of them."

P. H. SHERIDAN, Lieutenant-General.

We don't hear in any of the reports a word about the conservative General Howard. It is possible he was protecting General Miles's rear, as he has already shown rare skill in guarding the reserves.

The President has recognized the following named Consular officers for Spain: Juan De Alminara, Consul at Savannah; Luis De Zea Bermudez, Consul at Charleston, and Alberto Goicoechea, Vice Consul at Savannah.

The Smithsonian Institution is in receipt of a telegram from Professor Peters, Clinton, New York, announcing the discovery of a planet of the eleventh magnitude, in one hour and five minutes right ascension, seven degrees fifty-five minutes north declination, and a south motion.

Mrs. Emily Edson Briggs (Olivia) has been appointed by Secretary Schurz a member of the Board of Visitors for the United States Hospital for the Insane. Mrs. Briggs is the first lady who has ever been appointed on this or any other of the advisory boards connected with government institutions.

As in the line of our record, we give the following message from the Secretary of the Treasury, transmitting extracts of the appropriations required to complete the service of the fiscal year, ending June 30th, 1878:

TREASURY DEPARTMENT, October 15th, 1877.

SIR: Agreeably to the joint resolution of Congress of January 7th, 1846, I have the honor to transmit, for the information of Congress, the estimates of appropriations required for the military establishment for the service of the fiscal year ending June 30th, 1878, as furnished by the Secretary of War, together with special estimates of other deficiencies and reappropriations required by the several executive departments for the current and past fiscal year, as follows:

War Department.....	\$32,436,764.08
Library of Congress.....	22,800.00
Court of Claims.....	1,206,453.90
Treasury Department.....	273,891.20
Post-office Department.....	700,000.00
Navy Department.....	2,063,861.27
Judicial.....	202,545.22
Total.....	\$36,906,806.66

Accompanying these estimates are the following, submitted by the Secretary of War without recommendation: Forts and fortifications, \$2,078,000; rivers and harbors, \$13,220,100. The estimate of \$1,031,453.58 for permanent annual appropriations is also submitted for the information of Congress, but is not recommended.

I am, very respectfully, your obedient servant,

JOHN SHERMAN, Secretary of the Treasury.

The President has appointed Thursday, the 29th of November, "as a day of national thanksgiving and prayer." In his proclamation, he says: "In all the blessings which depend on benignant seasons, this has indeed been a memorable year. Over the wide territory of our country, with all its diversity of soil and climate and products, the earth has yielded a bountiful return to the labor of the husbandman. The health of the people has been blighted by no prevalent or wide-spread disease, no great disasters of shipwreck upon our coast, or to our commerce on the seas, have brought loss and hardship to merchants and marines, and clouded the happiness of the community with sympathetic sorrow. In all that concerns our strength and peace and greatness as a nation; in all that touches the permanence and security of our government and the beneficent institutions on which it rests; in all that affects the character and dispositions of our people, and tests our capacity to enjoy and uphold the equal and free condition of society, now permanent and universal throughout the land, the experience of the last year is conspicuously marked by the protecting providence of God, and is full of promise and hope for the coming generations. Under a sense of these infinite obligations to the Great Ruler of times and seasons and events, let us humbly ascribe it to our own faults and frailties if, in any degree, that perfect concord and happiness, peace and justice which such great mercies should diffuse through the hearts and lives of our people, do not altogether and always and everywhere prevail. Let us, with one spirit and with one voice, lift up praise and thanksgiving to God for His manifold goodness to our land and His manifest care for our nation."

**Abroad** nothing has occurred since our last issue to materially alter the outlook. Russia, it is true, has gained some triumph, but not sufficient to place her prospects much brighter. In France the result of the election shows a victory for the Republicans. The New Chamber will consist of about 320 Republicans and 210 Conservatives. The papers say that both the opposition and the government are disappointed, the former having hoped to return four hundred deputies.

The honors of France have been extended to our ex-President Grant, and at this writing he is the lion in the city of Paris.

**The True System of Finance.**—The rapid increase of political economists during the last decade should have given to the American people a sound system of finance long ere this, but it is a most lamentable fact that this very increase has rather increased the confusion of ideas upon the subject. If everybody's system proved to be all that is claimed for it—"The True System"—there certainly would be a certain degree of homogeneity or uniformity of ideas in them as an aggregate. Not that it is essential in order to reach a given objective that the same road or means should be taken, but that each should reach the same conclusions on tenable grounds. True, each system may possess a different class of factors, but they converge, instead of diverging upon one common centre. This they have failed to do. Yet in all the obscurity we see practical methods which, if made measures by our present Congress, now in session, would disperse

the remaining clouds now hovering over the industrial interests of the nation.

In the one hundred and one years which have elapsed since the formation of this Government, there have been fourteen disastrous panics, all traceable to one cause—all precipitated upon the country by similar indiscretions. Upon an average there has been a financial panic, followed by bankruptcy and the most disastrous results, every seven years. Possessing a land large enough for all, and full of natural riches, all classes accumulate wealth easily. But every seventh year, society, from the humblest laborer to the strongest merchant, is profoundly shaken by a financial commotion which injures rich and poor alike. There has been a continual state of uncertainty. A man who is comfortable one day, might be penniless the next. Under such circumstances, business ceases to be legitimate trade and becomes an affair of guess-work—of speculation.

What has been the matter? Is there a cure for these evils? These are the questions of the hour, which override all others in importance.

A careful examination of our history will show this. Every disturbance of values, every panic in business affairs, has been the result directly of financial legislation. No money and inefficient money have retarded enterprise, retarded trade, retarded civilization. The people have suffered under the most vicious systems of money which an ignorant or corrupt legislation could invent. A currency was given to the country lacking the first elements of money—which are stability and honesty. Subject to no fixed law, it was contracted at the will of individuals. Every time it was contracted there resulted a convulsion in business—and great houses tumbled like so many bricks set up in a row. Every time it was contracted labor was thrown out of employment and suffered the pangs of enforced idleness—sometimes the awful agonies of starvation. Every panic, every stoppage of business, every period of bankruptcy and idleness may be traced to this one cause—the miserable currency and contraction. There is not a single exception—not one. With every natural advantage, we have been the victims of ignorant law-makers. We are now in the midst of the greatest of all our panics—this is the fourth and worst year. It is time to stop it if we would save a portion of what yet remains.

As there is but one cause, so there is but one remedy. We must have a currency which will not fluctuate in value, and which is not dependent upon the whim of a few individuals for the regulation of the amount.

It is to remedy this evil that we propose a resumption of specie payments by the issue of a greenback which shall be,

1st. Receivable for all dues, public or private.  
2d. Interconvertible with the new four per cent. bonds, so that all excess of currency not required for business purposes, may be converted into Government bonds, and any lack of currency may be supplied by a reconversion of the bonds into greenbacks—a measure which must give a currency exactly adequate to the business of the country, and which will be neither contraction nor expansion. Inasmuch as the four per cent. bonds are now equal to gold, this convertible greenback must be equal to gold, as certainly as things equal to the same things must be equal to each other.

Sooner or later this will be found to be the only remedy.

All the wild talk of the so-called "gold resumptionists" and all their baneful theories, will give way to the only method by which prosperity can be restored. The vague notions of the Communist, and fanciful ideas of such men as John Sherman, must equally resolve themselves into nothingness, before the teachings of common sense.

The public mind is being rapidly educated upon this subject. In Congress it becomes the principal question of debate. As the plain, matter-of-fact business men of the country come to examine into it, its importance becomes suddenly manifest to them. This panic has been the most severe, but it will in the end bring about the cure for all the financial ills under which we have labored for these hundred years. Then will come the time when all men will have an opportunity for labor, and when financial earthquakes will be relics of barbarism. "Men do not dream of the prosperity which is yet in store for all orders of the people."

An interesting and original illustration of this financial problem, is given in the *True Citizen*, and we believe it will be appreciated by the readers in this connection.

Every manufacturing establishment or printing-office that is run by steam-power, has a broad-belt which passes around both the driving-wheel of the engine and the main shaft. This belt has no power in itself, but it is the medium by which power is communicated from the engine to the shaft, and from thence to the machinery which is to be operated by it. If the main shaft belting should be removed, all the machinery would stop. If it should be narrowed by cutting off from either edge, the machinery would run slower, and perhaps stop. If the machinery stopped by reason of the belting being made narrower, it might be started again by disconnecting a part of the machinery. If a part of the machinery should be disconnected, then the small belts which are used to convey power from the shaft to each machine would hang idle and useless. Suppose, under these circumstances, some one should come to the factory and inquire why so much of the machinery was idle. He would be told that it was owing to a deficiency of *belting*. But it might be observed that plenty of idle belting was hanging near each idle machine—hence, how can this stoppage be owing to a want of belting? The answer would be, the deficiency is in the *main shaft belting*, which conveys power from the *engine* to the shaft—not in the belting that conveys power from the shaft to the machines.

The visitor might say, "I need some belting. I have a number of threshing machines ready to ship, but have no belting to send with them. Will you lend me some of this idle belting, that I may cut it and fit it to my threshing machines? I have ordered a supply of belting from Chicago, and will return you an equal amount, with something additional for the use of it."

The answer would probably be: "I would gladly lend you my belting which is idle, if you would be certain to return it to me instantly, on *call*, in case I should want it, and I should certainly want it instantly, as soon as a sufficient main shaft belt was supplied. But I cannot loan it to you at any price to be taken down, cut up, and sent with threshing machines to the West. I can only lend it absolutely on *call*, and it must not be taken far away. I would lend it to you on *call*, at the rate of two cents a year on each hundred

feet." But this offer is not taken—there are "no loans" of belting.

The legal tender of a country—or what serves the purpose of legal tender—is like the main shaft belting in mechanics.

Bank checks and accounts, drafts, bills of exchange, etc., are like the other kind of belting which conveys power from the shaft to the machine.

If the main shaft belting is deficient, machines must be detached from the main shaft or all will stop. So when legal tender is deficient, money of account (credits in bank), available for transfer by checks, is idle and is freely offered in our commercial centres as low as two per cent. per annum *on call*, and frequently not taken at that. So we frequently see the quotation "money two per cent. in New York on loans," when, if Chicago, Cincinnati and St. Louis should on the next day order the balances from them to be forwarded by express in greenbacks, or even in currency, they would withdraw so much of the reserve (the financial main-shaft belting), from that city, that its banks would be obliged to decline to loan at any rate of interest, until they could obtain a sufficient supply of Legal Tender to make good their reserve.

The *American Monthly* with this issue completes its Ninth volume. The full Tables of Contents, Lists of Illustrations, and Names of Contributors to the two volumes of 1877, which preface this number, show what we have done during the past year more fully than any brief we could make here. What has been done is now a matter of record, with which contributors, subscribers, readers, and the general public are already familiar. Our labors, notwithstanding the general depression of business, have been appreciated and recognized substantially by steadily-increasing numbers of friends and patrons. In all parts of our great country the *AMERICAN MONTHLY* has been cordially welcomed, giving us assurance that its influence has been to educate and strengthen the home circle in those things which elevate and purify society.

Our patrons and contributors merit a full meed of praise for their heart, mind and hand coöperation with us to make the magazine entertaining and instructive. Our editorial labors have been lightened, and at times made pleasurable, through the many "good words and cheering thoughts" that have come to us from all parts of the Union.

To the press, also, are we grateful for its signals of light, pointing to our sanctum and the merit of our publication.

With the January number we will open our Tenth Volume, with strengthened faith in our mission, and bright promises for our friends. All those features which go to make a magazine entitled to take a front rank among an educated and enlightened people, it shall be our aim to give *POTTER'S AMERICAN MONTHLY* for 1878. Questions which affect government and society will be considered from independent and broad platforms, holding ourselves neutral in nothing, cosmopolitan in all things.

Influence in behalf of our work is solicited from all.

Believing that the general dissemination of our periodical, as a vehicle of thought, is calculated to increase the refining and ennobling forces in society and at HOME, we ask you, dear reader, to help us enlarge our sphere of usefulness.

## LITERATURE AND ART.

**The Elements of Literary Renown.**—There is probably no subject more vaguely understood than the true causes of literary renown. So much has been said and written concerning the elements which must of necessity lie at the foundation of all human achievements, that it is remarkable that the world is still in such a state of ignorance relative to the primal and secondary fountains from and through which the intellectual and moral forces in all ages have sprung. This is true in an eminent sense as applied to art and literary attainments. The germs out of which new and higher orders of life grow in the vegetable kingdom, have been exhaustively treated by naturalists with satisfactory, if not always logical, results; but the true origin and nature of the supplies that have given to the world men and women illustrious through their works, are still clouded with the mists of doubt. While the multitude are measurably content with some one or all of the theories advanced as solutions of the problems bearing upon human greatness, in the fields above referred to, many earnest and faithful thinkers are by no means satisfied. The prevailing idea is that eminent success in any department is indisputable evidence of inherent genius, and that this is beyond the pale of acquisition for those not thus gifted. This opinion or belief is productive of no small amount of evil, as it tends to check laudable ambition, and thus deprive mankind of the fruits of many noble minds. No more erroneous idea could be formed, generally speaking, as to the underlying elements of what is called greatness. While we concede birthrights to such powers for a few, the major portion of those who have illuminated their day and generation have possessed no extraordinary native talent.

It is generally supposed that the possessor of the coveted quality may dispense with those habits which are admitted to be so essential to a man of business. We admit the existence of the quality—a disposition of mind, often hereditary, which qualifies a man for a particular pursuit—but deny its importance, unless accompanied by the less showy but more sterling attributes of industry, energy and perseverance. So important are these characteristics, that even writers eminent for their knowledge of mankind have asserted, that an individual possessed of a determined will can distinguish himself in any pursuit, irrespective of predisposition towards it. Though we are not prepared to go to this length, we conceive that a little genius, when accompanied by these qualities, will go a long way; whereas, a large share of it, unassociated with such important accessories, will be a curse rather than a blessing to its possessor.

If there is one fact more than another which strikes one in studying the lives of great men, in any of the avenues which lead to distinction, it is the life of unceasing toil they lead, coupled with such an attention to details as less gifted men would have scorned. To hear some people talk of a man of genius, one would think that the general had but to grasp his sword and lead his men to victory; or the author to take up his pen, and the work which is to charm thousands flows

readily from it. But in the one case, the years of toil expended in training these soldiers, in mastering the science of manœuvring them, and attending to camp details, are forgotten; and in the other, if we follow the author to his desk, we shall probably find, by the blotted and interlined manuscript, the knitted brow, and frequent reference to books, that the work is not produced in so easy a manner as had been supposed. The case of Sir Walter Scott may be advanced in opposition to this, for some of his books were penned as fast as his quill could "trot" over the page; but then we must remember the years of preparation he had gone through—thirty-four years had passed over his head when he wrote his "Lay," and forty-three when "Waverly" was published—to accomplish such a result, during which he had steeped his soul in archaeological lore, border legends and ballads, and studied character with unwavering minuteness.

We trust that the examples we shall give in the present paper of the toil undergone by those who have won a niche in the Temple of Fame, will show that really good work of every kind is the product of hard, unflinching labor—mere drudgery, often—and that such statements will encourage those who, misled by the too popular estimate of genius, wonder that they do not more easily accomplish their designs.

Sir Walter Scott's rapid method of working has been mentioned as a fact which might be quoted against our theory, but nothing could exceed his care when "getting up" a subject. For example, when writing "Rokeby," he visited Mr. Morritt, and said he wanted "a good robbers' cave, and an old church of the right sort." That gentleman says: "We rode out in quest of these; and he found what he wanted in the ancient slate quarries of Brignoll, and the ruined abbey of Egglestone. I observed him noting down even the peculiar little wild-flowers and herbs that, as it happened, grew round and on the side of a bold crag near his intended cave of Guy Denzil, and could not help saying that, as he was not to be upon oath in his work, daisies, violets, and primroses would be as poetical as any of the humble plants he was examining. I laughed, in short, at his scrupulousness; but understood him when he replied: "That in Nature herself no two scenes are exactly alike, and that whoever copied truly what was before his eyes, would possess the same variety in his descriptions, and exhibit, apparently, an imagination as boundless as the range of nature in the scenes he recorded; whereas, whoever trusted to imagination would soon find his own mind circumscribed and contracted to a few favorite images; and the repetition of these would sooner or later produce that very monotony and barrenness which had always haunted descriptive poetry in the hands of any but the patient worshippers of truth." Lockhart was astonished to find, that even during a trip in which he accompanied Sir Walter into Lanarkshire, the latter continued his literary labors. "Wherever we slept, whether in the noble mansion or in the shabbiest of country inns, and whether the work was done after retiring to rest at night, or before an early start in the morning, he very rarely mounted the carriage again without hav-

ing a packet of the well known aspect ready sealed and corded, and addressed to his printer in Edinburgh."

At a banquet given once at Liverpool to Charles Dickens, he said, that all he could claim in establishing the relations which existed between himself and his readers was constant fidelity to hard work, and remarked, that his literary fellows knew very well how true it is in all art, that what seems the easiest done is oftentimes the most difficult to do, and that the smallest truth may come of the greatest pains. This was exemplified in himself in a remarkable degree, as the following incident, related by Mr. Mundella, M.P., at a public meeting at Sheffield a year after, will show. A distinguished artist once said to him: "When I was painting a portrait of Dickens, it was arranged that I should sit in his room while he was at work. He was a most painstaking, industrious, and methodical man, and nothing would divert him from the regularity of his habits. I was there for hours, and he wrote, as it seemed to me, almost with anguish. I looked in his face, and watched the anxiety and the care. I saw the blotting and the re-writing of his work, and was astonished to find how much he owed to his indomitable perseverance."

To the same effect wrote Mr. Arthur Helps in *Macmillan*: "Those who have seen his manuscripts will recollect what elaborate notes, and comments, and plans (some adopted, many rejected) went to form the basis of his works. To see those manuscripts would cure anybody of the idle and presumptuous notion that men of genius require no forethought or preparation for their greatest efforts, but that these are dashed off by the aid of a mysterious something which is comprehended in the word genius. It was one of Mr. Dickens's theories, and I believe a true one, that men differ hardly in anything so much as their power of attention."

Lord Lytton—himself an indefatigable worker—was of the same opinion. "What men want," he wrote, "is not talent; it is purpose; in other words, not the power to achieve, but the will to labor;" and Lord Chesterfield had observed before him: "The power of applying our attention, steady and undissipated, to a single object, is the sure mark of superior genius."

Take the testimony of two schoolmasters of the highest class. Dr. Arnold of Rugby wrote, as the result of his great experience: "The difference between one boy and another consists not so much in talent as in energy;" and his successor, Dr. Temple, in one of his sermons, says: "Nothing can be a greater mistake than to suppose that genius dispenses with labor. What genius does is to inspire the soul with a power to persevere in the labor that is needed; but the greatest geniuses in every art invariably labor at their art far more than all others, because their genius shows them the value of such patient labor, and aids them to persist in it."

Lord Macaulay's industry was untiring. He would spend hours in the Library of the British Museum hunting up what many would think an unimportant fact, and those who read his well rounded periods little knew with what labor they were produced. His thrilling narrative of the western rebellion was not written in his own study, but in a cottage on the the Somerset marshes, in which he spent weeks, so that no detail to be gained from the spot might be wanting in his description. To this quality, more than any other, he was indebted for his fame.

Jeffrey, the original editor of the *Edinburgh Review*, was an indefatigable worker. If he had not been, it is probable that the *Review* would have died in its infancy. That he had great difficulty in keeping his team in order, appears from the following extract from a letter to Horner, asking for his contribution: "I have some right to dun, too, not merely because I am the master to whom your service is due, but because I have myself sent fifty pages to the press before I ask you for one. Hear now our state, and consider: Brown has been dying with influenza, and is forbidden to write for his chest's sake. Brougham is roaming the streets, or correcting his colonial proofs, and trusting everything to the exertions of last week, and the contributions of the unfledged goslings who gabble under his wings. Elmsley—even the sage and staid Elmsley—has solicited to be set free from his engagements. And Timothy refuses to come under any engagements, with the greatest candor and good-nature in the world."

Byron said that Sheridan had written the best comedy, the best opera, the best farce, and delivered the best speech known. He appeared to his friends as a brilliant wit and writer, producing *bon-mot*, speech, or play without effort. But when Moore published his manuscripts after his death, it was discovered that all was the product of toil and elaboration. The wit he had been conning over in the morning, he would wait patiently to introduce in such a manner that it appeared an inspiration; and his speeches were often written several times over, and committed to memory. Such a sentence as the following would be written many times before he was satisfied with it: "His (Bonaparte) are no ordinary fortifications. His martello towers are thrones; sceptres tipped with crowns are the palisades of his entrenchments, and kings are his sentinels." The dialogues in his plays were elaborated in like manner.

Moore spent nearly eighteen months reading up Greek and Persian works for *Lalla Rookh*, and the result was, that it exhibited such fidelity to Oriental manners, customs, and scenery that its popularity even in the East was extraordinary, and people found it difficult to believe that its scenes were not penned on the spot. The circumstance of this poem, with its gorgeous Oriental scenery and sentiment, being written during the depth of winter, in a secluded dwelling in Derbyshire, is in itself a marvel. Many of Moore's songs were also the product of much labor.

Our own Bayard Taylor, William Cullen Bryant, and other writers of national fame, have won their laurels only after many years of painstaking toil and unwavering perseverance.

**Nicholas Minturn.** By J. G. HOLLAND. *New York: Scribner, Armstrong & Co.*

Dr. Holland, in this work, has weaved considerable wisdom and very entertaining pictures of humanity under different influences. Nicholas Minturn, the central character and hero, is made to appear as a model of courage and philanthropy. Wealth at his command is regarded more as a trust from a Higher Power to make the world better, than to administer to any selfish want. He figures as a great reformer, and inaugurates a revolution among the poor of New York, by teaching them the doctrine that begging is a sin, and that charity tends to augment pauperism and vice. This idea is

very prettily carried into practice, but the results can hardly be claimed as satisfactory. The complete isolation of self by the hero, is a charming example to the world, but, in several instances, a strain upon credulity—notably, where he encountered, with the pop-corn man, the three who had deceived him, and made them his instruments to establish his reform school. The picture, however, is gracefully drawn, and cannot fail to entertain. Where Nicholas becomes famous in his grand exhibition of both moral and physical heroism at sea, is, to our mind, the best drawn portion of the book. Mr. Benson, as a type of "duty" men, is a very faithful portraiture; and the lesson which this character teaches greatly enhances the value of the book. When we come to divorce religion from business, we may avoid conflicts of conscience with policy; but to allow both to travel as a match team, requires a higher order of Christianity and more honorable system of barter and trade than is generally practiced in the present age. The circumstances preceding and preliminary to Benson's death, are quite natural, save the last act, which fastens the crime of murder upon an injured party. This portion of the most thrilling story seems a little unnatural, as well as an ending rather trying to sensitive nerves.

The part taken by Nicholas's bosom friend, Montgomery Glezen, is captivating, and leads the reader into strange expectations. Miss Larkin, the heroine, Mr. and Mrs. Coates, and daughter, are made to perform their parts very creditably, and lend quite an additional interest to the story. What Mrs. Coates, *she said*, is made, however, a little monotonous by a too frequent repetition. "Talking Tim" is one of the instructive features of the book. Tim's sermon on Mission Schools will compensate perusal.

This book can only be understood and fully appreciated by reading it; and the home circle will be made wiser, and, we think, happier, by its presence. It is 12mo, 418 pages, handsomely printed, and elegantly bound.

**Historical Sketches of Plymouth, Luzerne County, Pennsylvania.** By HENRY B. WRIGHT, of Wilkesbarre, Pennsylvania. Philadelphia: T. B. Peterson & Brothers, Publishers.

The author and publishers, in this volume have given to the public a most valuable book, replete in historical matter, handsomely printed on good paper, and bound in black morocco, heavy boards, and gold-lettered imprint, duodecimo size, and made specially attractive by some twenty odd elegant photographs of pioneer and representative men identified with the history of Plymouth. The title is prefaced with a photograph of the handsome author, followed by a fine view of Plymouth Rock.

We have rarely read a book with deeper interest than this one; it literally carries us back to the memorable events prior and subsequent to the Revolutionary War. The style is so natural, and the spirit of the author so patriotic, that we seemed to see, and hear, and feel the memorable battles and heat of the long struggles of the Colonists. It is gratifying to see graphically pictured the noble spirits engaged in the early settlements of any portion of our great Republic; but to have brought before us in such vivid style the minor and major characters and incidents of the great Pennanite and Yankeeite war for rights of land and home, in what was

at that time the wilds of the Sun-able surprise. No one can read to the descendants of the first set must be an invaluable souvenir.

**"Theo." A Love Story.** By BURNETT, Author of "That i delphia: T. B. Peterson & B

## SCIENCE AND MECHANICS.

**Personal Equation.**—Among the discoveries in the field of Science to which public attention has recently been called, both in Europe and this country, is that of Personal Equation. Its special application, as a matter of utility, has been confined to the domain of Astronomy. One writer designates it as "a phenomenon;" but, to our mind, there is nothing wonderful or mysterious connected with it. In making the common observation of the exact moment when a star travels across the fine vertical wire intersecting the field of view of a telescope, some observers always anticipate the event, and others allow it to pass before they succeed in noting it. This, Francis Galton, F.R.S., in his address as President of the Anthropological Department of the British Association, says, is "by no means the effect of inexperience or maladroitness, but is a persistent characteristic of each individual, however practiced in the art of making observations he may be." The difference between the time of a man's noticing an event and that of its actual occurrence, is called his "personal equation," and it is carefully ascertained for every assistant in every observatory, and is published along with his observations. Hence, the magnitude of one's personal equation indicates a fundamental peculiarity of the constitution of that particular individual. This conclusion is in complete harmony with reason and the general experience of mankind, even when entirely isolated from the sphere of astronomy or the realm of philosophy. Experience, which lies at the root of all science, has from time immemorial gauged or equated individual character.

It is no new idea or discovery that there are quick-witted people and slow-witted people, and, therefore, nothing specially "startling," as one writer has it, in the fact that the pace of mind may be measured by inches and a clock. "As quick as thought," is an expression frequently heard, but *how quick* that is as variable as the pulsations of the human heart. Yet the pulsations are accurately measured, and the conditions of the mind and body equated. Not that health requires to register one invariable and uniform number of pulsations per minute, for all persons alike, but that the temperament, occupation, climate, habits, etc., all considered, a general required average of each individual is demanded as an index of good health.

The same principle applies to the individual motion of the body, and is recognized as "the gait" of this or that one. Intimate acquaintance with any one will soon furnish reliable knowledge of this peculiarity, and this knowledge has been demonstrated so trustworthy as to enable one familiar with it to recognize, at a distance, a person's "foot-fall" after many years of absence. Here *sound*, in lieu of sight, is actually equated. If *time* enter into the composition of all things in the material world, is it not clearly within the range of possibilities to establish every man's and every woman's equation in each distinctive particular which goes to make up character? Nay! more, is it not within the range of human achievements to gauge a man's value to society and the world by his personal equation?

**A Valuable Discovery.**—Many of the most wonderful and valuable discoveries, both ancient and modern, have been accidental. Notable instances will be readily called to mind by the intelligent reader, not only of the discovery of gold and other mines of great value, but also the germs of such great and useful arts and inventions as printing, steam, electricity and various kinds of mechanism. Among the modern and, indeed, recent discoveries of great value to mankind, one in our country is particularly noteworthy. It is that of the discovery of a mine or vast bed of borax, by which a most useful and necessary article, instead of being an expensive luxury as formerly, is rendered so cheap as to bring it within the means of all classes.

This remarkable discovery was made in Esmeraldo County, Nevada, a short time since, by a young man who was prospecting for gold and silver mines. While thus engaged, traversing mountains, cañons, and valleys on horseback, he saw, in a valley known as Teel's Marsh, what appeared to be a vast bed of white sand, resembling dry sea foam. The appearance was so novel and singular that he dismounted and descended to prospect the object. Upon arriving at the place, he found it to be the bed of a dry lagoon with the appearance of having been dry for centuries. Walking cautiously over the place, he found the surface to be soft and clayey, and often sunk ankle deep. After an examination of the curious clayey deposit, he put several handfuls into his pockets, mounted his horse, and returned across the mountains to his home in Columbus. There he handed the contents of his pockets to an assayer, who, after analysis, pronounced it the richest sample of borax he had ever seen.

**The Science of Living.**—In the November issue of the MONTHLY want of space compelled us to break off the discussion of the subject which heads this article; our object being to show that the quantity of food is of *secondary* importance, and that the supply of the nutrition essential to meet the demands of nature should command at all times the *first* consideration in our efforts to approximate the cost of living.

Dr. Letheby, in his valuable work on "Food," gives a table showing the amount of carbon and of nitrogen in a large number of articles of diet. From this table we have taken the values of the varieties of food in the given list, and we find that the sum total of the entire regimen amounts to 18,117 grains of carbon and 751 grains of nitrogen daily. According to Dr. Wilson, the dietaries of women should be about one-tenth less than those of men, and of children under ten years about one-half (maximum) those of women. Applying these rations to the aggregate, we find that the husband's daily diet is 4,365 grains of carbon and 180 grains of nitrogen; and the wife's 3,928 grains of carbon and 162 grains of nitrogen, and the remainder constitutes the food of the children.

Now this diet is not enough to support life in the husband and to enable him to work. In other words, we mean to say

that a man that attempts to do even moderately hard work on food containing the proportions we have mentioned, is steadily falling behind in the struggle for existence. And it is mathematically obvious that he cannot improve matters save at the expense of other lives. From the mean of all the researches which have been made by eminent physiologists—and they cover thousands of instances—Dr. Letheby gives the following as the amounts required daily by an adult man for idleness, or ordinary labor, and for active labor:

	Carbon, grains.	Nitrogen, grains.
Idleness.....	2910	180
Ordinary labor.....	6498	307
Active labor.....	6823	139

It may be said that working men cannot be expected to consider chemically everything they eat. Perhaps not, but it is the duty of sanitary authorities, and others charged with their welfare, to do it for them. Half a pound of cheese, a pound of Indian meal, and a quart of milk, together aggregating 5,187 carbon, and 449 nitrogen, costs 14 cents. On this a man could do steady work for one day, and could keep on on the same diet continuously. The same sum would purchase one loaf of bread and a quarter of a pound of butter, on which, as a continuous diet, a man could not subsist. For the guidance of working men who wish to base their living on proper and cheap food, we give herewith Dr. Letheby's table:

Grains per pound.		Grains per pound.	
Carbon.	Nitrogen.	Carbon.	Nitrogen.
Split peas.....	2069	248	43
Indian meal.....	3018	120	44
Barley meal.....	2563	68	483
Rye meal.....	2093	68	204
Seconds flour.....	2700	116	189
Oatmeal.....	2831	130	184
Baker's bread.....	1973	68	100
Pearl barley.....	2440	91	95
Rice.....	2732	68	76
Potatoes.....	709	22	195
Turnips.....	263	13	217

Salt butter.....	4565	—	—
Fresh butter.....	6498	—	—
Cocoa.....	3034	140	—
Beer.....	274	1	—

It should ever be borne in mind that the character of the nutrition required to supply mental or *brain* power is entirely different from that which supplies *muscular* force and vigor. A larger proportion of phosphorus is needed for the former, such as fish and other similar articles of consumption furnish. The cost of living will consequently vary with the occupation, viewed entirely from a scientific standpoint. If viewed from a social point, employment which calls into play the intellectual powers mainly, necessitate a larger outlay of money to supply the almost inexorable laws of society—the entertainment of friends and visitors with an inviting board. This extra expense cannot be ignored, as it is in a greater or less degree one of the penalties (if one chooses to so call it) attached to social prominence. Superior intelligence and education usually awaken desires in man or woman to reach higher planes in the social world, and having reached them, influence and power naturally follow. We would like to record that such promotion augmented the higher moral forces in the world in the same ratio as the growth of such influence and power, but statistics would not sustain it. Power, too frequently, is but a prelude to corruption. But to the main

question at issue we return, *i.e.* "The Science of Living." The general intelligence of the masses of the American people need only be brought to bear upon this subject in order to form a stable basis upon which to predicate an equitable rate of compensation commensurate with their necessary cost of subsistence. That the labor population, or those who are engaged chiefly in occupations demanding only manual or muscular labor, can live at less expense than those engaged in intellectual pursuits simply in the matter of **TABLE SUPPLIES**, is too self evident to admit of discussion. And when we come to estimate the additional cost of rent, furniture, and clothing, which society demands of the educated classes engaged in intellectual means of livelihood, we are forced to admit that the rate of remuneration should be more. There certainly should be no antagonism between the two classes; both are essential for the good of society, the promotion of the arts and the sciences. One equals the other in the building up and sustaining of States and governments. One represents the warp and the other the woof of that great fabric called society. For ourselves, we do not sustain the low estimate made by the wife of a workingman, as given in the November number. We believe our remarks will warrant no such conclusion. No family of *seven* can live as they should live on the sum of \$7.97. The effort to do so can only result in wrecking the constitution and making it unfit for what should be the great mission of life, happiness—the sequence of usefulness.

**Optical Characters of Minerals.**—A new method of studying characters of minerals was described by Mr. Sorby, F.R.S., in a paper read before the British Association. The author first described the principles on which this method depended, and that the great difference between the appearance seen with the naked eye and the microscope is due to the object-glass being able to collect divergent rays. In looking with a low magnifying power at a small circular hole seen through a section of a crystal, very different phenomena present themselves, according to its optical characters. If double refraction, only one well-defined circular hole can be seen. If the mineral possess double refraction and only one optic axis, like calcite, two images of the hole are seen. If the section be cut perpendicular to the axis, two circular holes are seen directly superimposed, but at two different foci. If the section be in the plane of cleavage, two widely-divided images are visible, the one due to the ordinary ray being circular, and the other due to the ordinary ray being distorted and drawn out in two opposite planes at two different foci. When the section is cut parallel to the axis, this image due to the extraordinary ray is still more elongated, but the images are directly superimposed. We thus at once learn that the mineral has double refraction, has an optic axis, and also what is the direction in which the section is cut. In the case of crystals like aragonite, which have two optic axes, there is no ordinary ray, and at the focal points we see the circular hole drawn out in opposite planes into crosses. The character of these crosses depends upon the direction of the section, but the fact of the crosses being seen at once proves that the mineral has two optic axes. Some facts are better observed if, instead of a circular hole, we examine through the crystalline plate a grating with two

systems of lines at right angles to one another. We then obtain what the author calls unifocal or bifocal images, according to the system of crystallization. Crystals with double refraction have only one unifocal image; crystals having one optic axis have one unifocal and bifocal image; whereas crystals having two optic axes give two bifocal images. The definition of unifocal is independent of the position of the lines; whereas in the case of bifocal images the lines are distinctly visible only when they are parallel or perpendicular to a particular axis of the crystal, and, spread out, become obscure and disappear when rotated to a different azimuth. The above-named general characters differ so much in different minerals that they furnish a most valuable means for their identification.

**National Academy of Sciences.**—The annual meeting of the National Academy of Sciences was held recently in the Chapel of Columbia College. This society was founded in 1863 and is chartered by Congress. It numbers eighty members, all of whom are men who have made a lasting fame in the various branches of science. At the meeting were Professor Henry, of the Smithsonian Institute, President of the Academy; General Henry L. Abbott, United States Army; Professor Alexander Agassiz, Professor Stephen Alexander, of Princeton; President F. A. P. Barnard, of Columbia; General J. G. Barnard, United States Engineer; C. F. Chandler, of Columbia College School of Mines; Theodore Gill, of Washington; Julius E. Hilgard, of the Coast Survey; George W. Hill, of Nyack, Mathematician; Samuel P. Langley, of Pittsburg, Astronomer; Professor James Hall, State Geologist; Professor Loomis, of New Haven, Astronomer; Professor O. C. Marsh, of New Haven, who will be remembered by the Indian Commissioners; Alfred M. Mayer, of the Stevens Institute; Dr. J. S. Luberry, of New York; Raphael Pumpelly and Ogden N. Rood, of New York; J. Lawrence Smith, of Louisville; William P. Trowbridge, of New York; Professor Henry Draper, of New York; Professor Newton, of New Haven. Six papers were read, one by Professor Stephen Alexander on the law of extreme distances in the solar system, in which he alluded to Mars's new Moon in a scientifically humorous way. If an asteroid, he said, with an excess of velocity just equal to the present satellite came that way he did not see any reason why that asteroid might not have been appropriated. So he concluded, and right in the face of Professor Hall, that Mars's new moon is only an asteroid. Professor Gill followed, and read a paper on the morphology of the antlers of cervidae. Professor Rood read two papers, one on the construction for the study of the contrast of colors, during the reading of which an adjustable chromatic circle was shown, with the colors arranged upon its circumference, and the mode of ascertaining the effects of contrasts was explained in detail. It was also stated that the results obtained by using this circle corresponded to those which had been gained by the experience of painters. Professor Rood's second paper was on the photometric comparisons of light and different colors, by a series of experiments in colored disks, their luminosity being compared with that of black and white disks. The problem was solved by combining these disks with others painted in complementary colors. Professor Mayer read a paper on the new and simple

method of determining the number of vibrations of sonorous bodies, and General Henry L. Abbott read one on the velocity of transmissions of shocks caused by the explosion of gunpowder and nitro-glycerine compounds through the earthy crusts.

**Worth Knowing, if True.**—An enthusiastic admirer of Mr. Keely writes as follows regarding his latest achievement in the scientific world: "Fifteen pounds pressure on a column of mercury is supposed to represent a *perfect vacuum*, that being the pressure of the atmosphere per square inch. Torricelli, the Italian philosopher, who discovered the principle on which the barometer is constructed, obtained about fourteen and seven-eighths pounds of vacuum, the nearest approach to fifteen pounds ever known. Mr. Keely recently obtained, by means of the vaporic force in his famous motor, a little over *fifteen pounds*, and held it for three-fourths of a minute. He contends that vacuum is *not* fixed at fifteen pounds, but, as developed by his experiments, is subject to variation and increase—as pressure is. He expects to get and seal up a fifteen-pound (or more) vacuum and send it to the Franklin Institute. If he does, he will startle the entire scientific world."

**How to Use Light.**—Statistics kept by oculists employed in infirmaries for eye diseases have shown that the habits of some persons in facing a window from which the light falls directly in the eye as well as on the work, injure their eyes in the end. The best way is to work with a side light, or, if the work needs a strong illumination, so that it is necessary to have the working table before the window, the lower portion of the latter should be covered with a screen, so as to have a top light alone, which does not shine in the eyes while the head is slightly bent over and downward towards the work.

**To Make Composition Ornaments for Picture Frames, etc.**—Mix whiting with thin glue to the consistency of putty. Have the mould ready, rub it over with sweet oil and press the composition into it. When a good impression is produced, take it out and lay it aside to dry. If it be desired to fit the ornament to a curved or irregular surface, apply glue and bend it to the place where it is to be attached before it gets dry.

**Improvement in Marine Signals.**—The Bureau of Navigation will soon put in use on board the naval vessels the new night signal invented by Lieutenant Very, of the navy. This plan is based on the Roman candle system, and colored stars are projected from a pistol from two hundred to three hundred feet into the air, by means of which the commander-in-chief of a fleet can readily communicate with any or all vessels in any crowded harbor, notwithstanding intervening vessels, which is of itself a valuable improvement. By firing single red or green stars, or a combination of them, numbers from one to ten can be made, and all the sentences in the navy signal code be rapidly communicated. The stars projected from the pistol are brilliantly red and green, and can be seen at a distance of from ten to twelve miles, as has been ascertained by practical tests. This invention of a new means of nocturnal communication will, it is believed in high naval circles, be of incalculable service to the navy.

## GOSSIP AND NOTE BOOK.

**The True Ideal of Matured Life.**—The locomotive speed with which everything is done in our country, makes us at times conclude that the American people have no time even to grow old. We see too plainly to doubt the truth of the remark of a foreigner that "No American grows beautifully old." There are of course to be found here and there old age, in the natural order, fully ripened; a few restored to their second youth, in possession of all their powers, and the accumulated wisdom of an active and useful life.

The complete intellectual strength and health retained to the last by Lady Smith, who died at Lowestoft a short time ago, within three months of the great age of one hundred and four, opens out almost a new prospect for the aged.

That a woman who was born while the United States were British colonies, whose girlhood passed away while Warren Hastings was on his trial, who was married before the battle of Arcola, and might well have been married, had she married as early as many English girls do, before Napoleon's name had even been heard of—indeed, he was but four years her senior—should have lived to read the celebration of the centenary of American independence, of the proclamation of the Empress of India at Delhi, and to survive the second French empire by nearly seven years, and should, moreover, have lived to such an age without any loss of interest in public or private events; with the hymns she learned as a girl still fresh in her memory, and with the most vivid interest in the latest despatches of statesmen who were not born till her married and middle life was almost over, suggests at least the possibility of a very different termination to aged lives from that of which we have most frequent experience. Not that it can be said, in Lady Smith's case, that she lived

Till old Experience doth attain  
To something of prophetic strain.

She seems to have been a wise and thoughtful, but by no means exceptional, woman in anything but the unimpaired vigor of the faculties at an age when the nerves and the brain have usually gone before the body. But then that is precisely the interest of her case. Had she been a very remarkable woman in early years, everybody would have said that hers was a selected life, a physique of exceptional force, and that the unimpaired vigor of her faculties in age was due to the same exceptional causes which gave her her great brilliancy in youth. But as it is, excepting that the intellectual men of her youthful days found her a very fascinating woman—a not uncommon experience with regard to women who, like Lady Smith, are at once beautiful and amiable—there was no unusual power in her. And hence, of course, the vast age to which she retained her powers unimpaired—unless the defect of vision which came upon her after her hundredth year be so accounted—promises the more for the chance of other average men and women retaining their mental vivacity and interests to something like the same age. It is not much encouragement to ordinary men to know that a man like Lyndhurst retained the power to review the politics of the session with undiminished brilliance till after the age of

eighty, for no man could have become what Lord Lyndhurst became, without possessing an exceptional amount of physical vigor from the first. But if Lady Smith were exceptional at all, it was not shown in any overflow of youthful or mature energy, but only in the peculiar durability of the energy she had; and if durability be due, as it may be due, to some special congenital quality, no one need despair of possessing that quality till the facts show that he is wrong; while if it be not due to any congenital quality, but only to the prudence with which life is regulated, there is still more reason to hope that others may be able to follow Lady Smith's example.

But the interesting question, after all, is not so much what chance have we of living to anything like Lady Smith's age in the possession of equally unimpaired faculties—for every one must feel that such a chance is small—but, rather, what chance have we of retaining anything like Lady Smith's serenity and cheerfulness, if we do but live to her age; for that is a matter more likely to be within our own power, and very closely connected, too, with the other; for had Lady Smith been apt to fret and brood over the isolation of her position, she could hardly have retained her undiminished mental power to the age she did. For the full enjoyment of old age, there must evidently be a somewhat unique moral nature as well as a unique physique, and it is possible enough that it may be deficiencies of that nature, much more than any deficiency of physical energy, which so often cause old men and women to fret or brood themselves into premature apoplexy, or premature exhaustion. A nature evincing the highest degree of intensity and individuality of the affections is obviously not fitted to live on into extreme old age without suffering great wear and tear through very exhausting griefs. A nature that always craves the excitement of action, that is never happy except when wielding practical influence over others, is obviously unfitted to live on to such an age without suffering great wear and tear through impatience bred of enforced inaction. A nature, again, very conservative in its habits, one without high adaptability and elasticity in it, cannot change sufficiently with the times to conform to new modes of life and new modes of thought, without an amount of irritation which would hardly be consistent with unimpaired energy, and certainly not with unimpaired serenity. "To grow old in an age you condemn" is not a condition likely to fit you for a serene evening of life. Perhaps the best temperament for old age is that of such a poet as Sophocles, whom—

From first youth tested up to extreme old age,  
Business could not make dull nor passion wild,  
Who saw life steadily, and saw it whole,  
The mellow glory of the Attic stage,  
Singer of sweet Colonus and his child.

or of such a poet as Goethe—

Who took the suffering human race,  
And read each wound, each weakness clear,  
And struck his finger on the place,  
And said, "Thou sittest here, and here;"  
He looked on Europe's dying hour  
Of fitful dream and feverish power,  
And said, "The end is everywhere;  
Art still has truth—take refuge there."

**The Query Settled.**—Dr. Louis, of New Orleans, who is something of a wag, called on a Baptist minister, and propounded a few puzzling questions: "Why is it," he said, "that you are not able to do the miracles that the Apostles did? They were protected against all poisons and all kinds of perils. How is it you are not protected now in the same way?" The colored brother responded promptly: "Don't know about that, Doctor. I s'pect I is. I've taken a mighty sight of strong medicine from you, Doctor, and I is alive yet."

**Which was he After?**—"He is a man after my own heart, pa!" said Julia, reverting to her Charles Augustus.

"Nonsense!" replied Old Practical; he is a man after the money your uncle left you." And then all was quiet.

**Before there was any Tropics.**—A negro preacher elaborated a new theory of the exodus, to wit, that the Red Sea got frozen over, and so afforded the Israelites a safe passage; but when Pharaoh, with his heavy iron chariots, attempted it, they broke through and were drowned. A brother rose and asked for an explanation of that point. "I've been studyin' gography, and de gography say dat be very warm country—where dey have de tropics. And de tropics too hot for frezin'. De pint to be 'splaind is, 'bout breaking through de ice." The preacher straightened up and said, "Brudder, glad you axed dat question. It give me 'casion to 'splain it. You see that was great while 'go—in de ole times 'fore dey had any gography—'fore dere was any tropics."

**Noise about a Little Thing.**—A German Jew was eating a pork-chop in a thunder-storm. On hearing an unusually loud clap, he laid down his knife and fork and observed: "Vell, did anybody efer hear such a fuss about a little biece of bork!"

**The Conductor and Driver's Dispute.**—In 1850, when England was going mad about the question of "Papal Aggression," the interest of Londoners was centered upon Cardinal Wiseman, who had just been created Archbishop of Westminster. One day a portly gentleman, who much resembled the newly titled ecclesiastic, hailed a West-end 'bus, and got inside, whereupon a controversy in an undertone arose between the driver and the conductor as to the identity of of their passenger, the former treating with contempt the assertion of the latter that it was Dr. Wiseman. In order to settle the point the conductor descended from his perch on the step, and with a touch of his hat, apologetically addressed the stranger: "Beg your pardon, sir; but me and my mate has a bit of dispute about you; are you Cardinal Wiseman?" The old gentleman being a very staunch Protestant, and, withal troubled with a rather short temper, met the conductor's civil inquiry with a storm of oaths, and consigned him to a place where he certainly would not be in danger of catching cold. As soon as the passenger's vocabulary began to fail, the 'bus cad civilly touched his hat: "Thank you, kindly, sir," and then called out in a loud tone to the driver, so that everybody inside the vehicle should hear, "Drive on, Jim; it is the Cardinal!"

**An Innocent Thought.**—A three year old little girl at Rochester, New York, was taught to close her evening prayer, during the temporary absence of her father, with, "and please watch over my papa." It sounded very sweet, but the mother's amusement may be imagined when she added: "And you'd better keep an eye on mamma, too."

**The Result of Friction.**—An insurance adjuster went to see a man whose house had been destroyed by fire. Said *Adjuster*—"How did this thing happen?" *House Owner*—"Don't know; it's a mystery." *Adjuster*—"Well, I know." *House Owner*—"Let's have it; that's just what I'd like to find out." *Adjuster*—"It's friction." *House Owner*—"Friction? friction? What's that?" *Adjuster*—"Why, friction is the result of rubbing a thousand-dollar policy on a six-hundred-dollar house."

**Afraid to Reprove.**—A clergyman was annoyed by people talking and giggling. He paused, looked at the disturbers, and said: "I am always afraid to reprove those who misbehave, for this reason: Some years since, as I was preaching, a young man who sat before me was constantly laughing, talking, and making uncouth grimaces. I paused and administered a severe rebuke. After the close of the service a gentleman said to me: 'Sir, you have made a great mistake; that young man was an idiot.' Since then I have always been afraid to reprove those who misbehave themselves in chapel, lest I should repeat that mistake and reprove another idiot." During the rest of the service there was good order.

**Congratulation Misplaced.**—A noted miser who felt obliged to make a present to a lady, entered a crockery store for the purpose of making a purchase. Seeing a statuette broken into a dozen pieces, he asked the price. The salesman said it was worthless, but he could have it for the cost of packing in a box. He sent it to the lady, with his card, congratulating himself that she would imagine that it became ruined while on its way home. He dropped in to see the effect. The tradesman had carefully wrapped each piece in a separate bit of paper.

**Another Patient in the Neighborhood.**—A good story is told of a physician in one of our suburban towns. After he had continued his calls on a lady patient for some weeks, she expressed her fears that it would be inconvenient for him to come so far on her account. "Oh, madame," replied the doctor, innocently, "I have another patient in the neighborhood and thus I can kill two birds with one stone."

**The Same Thing for the Last Two Years.**—San Diego has a young gentleman telegraph operator, who, after repeated calls for a young lady operator in another office, at last got a response, and then, "click, click, click" (*fortissimo*), he telegraphed back to her vehemently, "I have been trying to get you for the last hour!" In a moment the following spicy reply came tripping back to him over the wires from the telegraphic maiden: "That's nothing; there is a young man here who has been trying to do the same thing for the last two years, and he hasn't got me yet."

**Shadows Against the Curtain.**—The Burlington *Hawkeye* says: A girl up on North Hill, who has never "a feller" in the world, goads the other girls in that neighborhood to madness by lighting up the parlor brilliantly, and then setting her father's hat where its shadow will be boldly marked against the curtain.

**A Judicious Elimination.**—He was a graduate of Harvard, and he got a position on one of the Philadelphia dailies last week. "Cut that stuff of yours down," said the city editor, as the new man came in with a column where a stick only was required. "Do you desire a judicious elimination of the superfluous phraseology?" mildly returned the Harvard man. "No! Boil it down!" thundered the city ed. The new man is gone now—gone back to Boston. He says there ain't "cultuah" enough in Philadelphia.

**Relieved from Embarrassment.**—A Scotch clergyman, who was a hard laborer on his glebe, and, when occupied in cultivating it, dressed in a very slovenly manner, was one day engaged in a potato field, when he was surprised at the very rapid approach of his patron in an open carriage, with some ladies whom he was to meet at dinner in the evening. Unable to escape in time, he drew his bonnet over his face, extended his arms, covered with his tattered jacket, and passed himself off as a scarecrow.

**The Lawyer and Scotch Divine.**—An eminent Scotch divine happened to meet two of his parishioners at the house of a lawyer whom he considered too sharp a practitioner. The lawyer jocularly and ungraciously put the question, "Doctor, these are members of your flock; may I ask, do you look upon them as white or black sheep?" "I don't know," answered the divine, dryly, "whether they are black or white sheep; but I know, if they are here long, they are pretty sure to be fleeced."

**Greatness in Confession.**—A learned man has said that the hardest words to pronounce in the English language are, "I made a mistake." When Frederick the Great wrote to the Senate, "I have just lost a battle, and it's my own fault," Goldsmith says, "His confession shows more greatness than his victories."

**The Old Story.**—"Do you know anything about an old story connected with this building?" asked an antiquary of a woman near an old ruin. "Oh, yes," was the reply, "there used to be another old story to it, but it fell down long ago."

**She Thought He Must Be.**—At a little gathering the other evening a young man asked a lady whether, if his small brother was a lad, he was not a ladder, and she kindly said she thought he must be, she could see through him so easily. It is pleasant to be a young man.

**Providence has Spared the Necessity.**—"My dear," said John Henry to his scornful wife, "Providence has spared you the necessity of making any exertions of your own to turn up your nose."

**Take which Road you Please.**—John Randolph was travelling in a part of Virginia with which he was unacquainted. In the meantime he stopped during the night at an inn at the forks of the road. The innkeeper was a fine old gentleman, and no doubt one of the first families of the Old Dominion. Knowing who his distinguished guest was, he endeavored to draw him into conversation, but failed in all his efforts. But in the morning, when Mr. Randolph got ready to start, he called for his bill, which, on being presented, was paid. The landlord, still anxious to have some conversation with him, began as follows:

"Which way are you travelling, Mr. Randolph?"

"Sir?" said Mr. Randolph, with a look of displeasure.

"I asked," said the landlord, "which way you were travelling?"

"Have I paid my bill?"

"Yes."

"Do I owe you anything more?"

"No."

"Well, I am going just where I please—do you understand?"

The landlord by this time got somewhat excited, and Mr. Randolph drove off. But, to the landlord's surprise, the servant returned to inquire which of the forks of the road to take. Randolph not being out of hearing distance, the landlord spoke at the top of his voice—

"Mr. Randolph, you don't owe me a cent; just take which road you please."

It is said the air turned blue with the curses of Randolph.

**The Drawing Brothers.**—Four brothers in Illinois have got rich by drawing houses. One is a house mover, one an architect, one an actor, and one had lucky tickets in a real estate lottery.

**"Thank You, I Will."**—"I'd like you to help me a little," said a tramp, poking his head into a country store. "Why don't you help yourself?" said the proprietor, angrily. "Thank you; I will," said the tramp, as he picked up a bottle of whisky and two loaves of bread, and disappeared.

**He Likes Long Rests.**—"Isn't that a beautiful piece of music?" said one of Mrs. Clogger's female boarders, as she turned from the piano. "I like it very much," replied Jones; "particularly those long rests that occur all through it."

**The Greatest Planet.**—Instructor in astronomy: "And now, young gentlemen, which of you can tell me the name of the greatest of the planets—the champion planet, so to speak—of our solar system?" Student: "I can, sir; it's Saturn." Instructor, hesitatingly: "And how's that, pray?" Student: "Why, because he carries the belt."

**As Seen when Shadows Fall.**—The setting of a great hope is like the setting of the sun. The brightness of our life is gone, shadows of the evening fall behind us, and the world seems but a dim reflection of itself—a broader shadow. We look forward into the lonely night, the soul withdraws itself. Then stars arise, and the night is holy.

# THE COMPOUND OXYGEN TREATMENT,

FOR THE

## CURE OF ALL CHRONIC DISEASES.

"The Compound Oxygen Treatment; Its Mode of Action and Results," is the title of a handsomely gotten-up pamphlet by G. R. Starkey, A.M., M.D., and bearing the imprint of Starkey & Palen, No. 1112 Girard Street, Philadelphia. This pamphlet treats of the "Compound Oxygen Treatment" as practiced by the publishers, both of whom are physicians. It should be read by everybody, that the merits of this potential curative agent may become generally known. It will be mailed free to all parties desiring it.

Mr. W. M. Claflin, Manufacturer, 1006 Arch Street, and Mr. H. J. Jacobs, Chief Clerk in the Architectural Bureau, Washington, were both confirmed consumptives eighteen months ago. We have their testimonials, written this June, that they are entirely well the last year.

Hon. W. D. Kelley thanks us "for renewed health, strength and the hope of years of comfortable life."

We are also permitted to refer to Hon. S. S. Field, United States Supreme Court; Judge Samuel Smith, New York; Hon. Montgomery Blair; Ex-Governor Boreman, West Virginia; T. S. Arthur, and many more.

### *From Arthur's Home Magazine for July.*

"In our magazine for this month will be found an advertisement of what is known as the 'Compound Oxygen Treatment,' for which unusual curative powers are claimed. Two or three years ago we spoke very favorably of this treatment. Since then we have had large opportunity for observing its effects, as well in our own case as in that of others, and can now speak of it with even greater confidence than before. One of the marked effects attendant on this treatment is an increase of healthy action in the whole system, every part of which seems to respond to the influx of a new life. We found this especially so in our own case, and in that of many others with whom we have conversed.

"Nearly five years have passed since we began using this treatment. Up to that period our health had been steadily declining; not in consequence of any organic disease, but from overwork and consequent physical and nervous exhaustion. The very weight of the body had become tiresome to bear, and we regarded our days of earnest literary work as gone forever. But almost from the very beginning of our use of the Compound Oxygen, an improvement began. There was a sense of physical comfort and vitality not felt for years, and this slowly but steadily increased. Literary work was resumed within a few months, the mind acting with a new vigor, and the body free from the old sense of weariness and exhaustion. A better digestion, an almost entire freedom from severe attacks of nervous headache from which we had suffered for twenty years, and from a liability to take cold on the least exposure, were the results of the first year's use of the new treatment; and this benefit has remained permanent. As to literary work in these five years, we can only say that it has been constant and earnest; and if its acceptance with the public may be regarded as any test of its quality, it is far the best work that we have done.

"So much for the results of the Compound Oxygen Treatment in our own case; and we give it for the benefit of any and all, who, in despair of old curative agencies, are looking anxiously for relief in some new direction."

*From Hon. Wm. D. Kelley.*

WEST PHILADELPHIA, June 6th, 1877.

DR. G. R. STARKEY, Philadelphia.

*Dear Sir:* Just about four years have elapsed since, overcoming a violent prejudice against any treatment that was offered as a specific for a wide range of apparently unrelated diseases, I yielded to the wishes of my friends, and abandoning other medicine, put myself in your charge.

Gratitude to you and duty to those who may be suffering as I was from chronic catarrh and almost daily effusion of blood in greater or less quantities, but always sufficient to keep one reminded of his mortality, impel me to say to you, and authorize you to give any degree of publicity to my assertion, that the use of your gas at intervals has so far restored my health, that I am not conscious of having discharged any blood for more than a year, and that my cough, the severity of which made me a frequent object of sympathy, has disappeared. In short, my experience under your treatment has convinced me that no future dispensary will be complete that does not embrace the administration by inhalation or otherwise, of your agent or its equivalent, to those who, from their vocation or other cause, are, as I was, unable to assimilate enough of some vital element to maintain their systems in healthful vigor.

Thanking you for renewed health, strength, and the hope of years of comfortable life, I remain

Your grateful friend,

WILLIAM D KELLEY.

The author of the following letter is Chief Clerk of the Architectural Bureau. His letter fails to present adequately his condition when he began treatment. He does not state, as he might, that he had had more than forty hemorrhages; that some had blamed me, and more had considered me a fool, for encouraging him to try once more to recover his health. Up to last February, he had had no occasion to ask a doctor for a prescription.

[COPY.]

WASHINGTON, D. C., June 7th, 1877.

DR. G. R. STARKEY.

*Dear Sir:*—Your favor of the 6th inst. is received, and in reply, I have pleasure in bearing testimony as to the efficacy of your Oxygen Treatment in my case.

As you will remember, I began the experiment (for so I considered it) in April, two years ago. At that time I was so reduced in strength, by frequent hemorrhages, as to be unable to walk to and from my office without the utmost exertion.

After two months' trial, I discontinued the treatment at your suggestion, being so far recovered as to feel no need of it. My health has been uniformly good from that time to the present.

Very truly yours,

H. G. JACOBS.

STARKEY & PALEN, 1112 GIRARD STREET, PHILADELPHIA, Pa.

RUSKIN,  
THOMSON,  
BROWNING,

and many others, are represented in the pages of

# LITTELL'S LIVING AGE.

THE LIVING AGE has been published for more than thirty-three years, and is admittedly unrivalled in its special field. It has never failed to receive the warmest support of the best men of the country, and has met with constantly increasing success.  
A WEEKLY MAGAZINE of sixty-four pages, THE LIVING AGE gives more than

THREE AND A QUARTER THOUSAND

double-column octavo pages of reading matter yearly, forming four large volumes. It presents in an inexpensive form, considering its great amount of matter, with freshness, owing to its weekly issue, and with a SATISFACTORY COMPLETENESS attempted by no other publication, the best Essays, Reviews, Criticisms, Tales, Sketches of Travel and Discovery, Poetry, Scientific, Biographical, Historical, and Political Information, from the entire body of Foreign Periodical Literature.

During the coming year, the productions of

## THE LEADING FOREIGN AUTHORS;

will be presented in its pages,—embracing the choicest Serial and Short Stories, and an amount

## UNAPPROACHED BY ANY OTHER PERIODICAL

in the world, of the most valuable Literary and Scientific matter of the day, from the pens of the foremost Essayists, Scientists, Critics, Discoverers and Editors, above-named and many others, representing every department of Knowledge and Progress.

THE LIVING AGE is, in short, a time, labor, and money-saving publication, furnishing the only satisfactorily COMPLETE as well as fresh compilation of a literature that is indispensable to EVERY AMERICAN READER—INDISPENSABLE because it embraces the productions of

## THE ABLEST LIVING WRITERS

in all branches of Literature, Science, Art, and Politics. Attention is invited to the following recent

## Opinions.

"THE LIVING AGE affords the best, the cheapest, and most convenient means of keeping abreast with the progress of thought in all its phases. . . . It is the best work of its kind ever published in the country, and can hardly ever be improved upon."—NORTH AMERICAN, PHILADELPHIA.

"In it we find the best productions of the best writers upon all subjects ready to our hand. . . . Through its pages alone it is possible to be as thoroughly well informed in current literature as by the perusal of a long list of monthlies."—PHILADELPHIA INQUIRER.

"Cannot be matched by any other periodical."—EPISCOPAL REGISTER, PHILADELPHIA.

"For all who desire to know the tendencies of current thought and feeling, THE LIVING AGE is not simply desirable, but necessary and indispensable."—BOSTON JOURNAL.

"Grows richer and richer the longer it lives. There is no other known way of getting so much good reading for so little money."—CHRISTIAN REGISTER, BOSTON.

"Fairly without a rival."—CONGREGATIONALIST, BOSTON.

"Its frequent issue and ample space enable it to do fully what it proposes to do—to give ALL that the very ablest of living writers furnish to periodical literature on science, history, biography, philosophy, poetry, theology, politics and criticism, and to add to this the full complement of the best that there is in fiction."—THE INTERIOR, CHICAGO.

"Every weekly number of THE LIVING AGE now-a-days is equal to a first-class monthly. For solid merit, it is the cheapest magazine in the land."—THE ADVANCE, CHICAGO.

"It is incomparable in the richness, variety, and sterling worth of its articles."—THE STANDARD, CHICAGO.

"It contains the best results of the world's thinking."—THE CHURCHMAN, NEW YORK.

"Its pages teem with the choicest literature of the day."—NEW YORK TRIBUNE.

"The best periodical in America."—REV. THEO. L. CUTLER, D.D.

"It is, beyond all question, the best compendium of the best current literature."—NEW YORK EVENING POST.

"WITH IT ALONE a reader may fairly keep up with all that is important in the literature, history, politics, and science of the day."—THE METHODIST, NEW YORK.

"A pure and perpetual reservoir and fountain of entertainment and instruction."—HON. ROBERT C. WINTHROP.

"It has no equal in any country."—PHILADELPHIA PRESS.

"The most valued of all the issues of the periodical press. . . . In offering in their completeness and freshness the best stories, sketches, essays, and reviews of the day, THE LIVING AGE has distanced all competitors among the eclectic, and well deserves a place in every household."—IOWA CHURCHMAN, DAVENPORT.

"The ablest essays, the most entertaining stories, the finest poetry of the English language are here gathered together."—ILLINOIS STATE JOURNAL.

"In fact, a reader needs no more than this one publication to keep him well abreast of English periodical literature."—SUNDAY-SCHOOL TIMES, PHILADELPHIA.

"To keep up with it, is to master the best thought of our time."—ILLUSTRATED CHRISTIAN WEEKLY, NEW YORK.

"Of all periodicals in the world, if a man can take only one, he should by all means take THE LIVING AGE."—MOBILE REGISTER.

"There is no magazine published that gives so general a knowledge of what is going on in the literary world."—PRESBYTERIAN WEEKLY, BALTIMORE.

"It is the only compilation that presents with a satisfactory completeness, as well as freshness, a literature embracing the productions of the ablest and most cultured writers living. IT IS, THEREFORE, INDISPENSABLE TO EVERY ONE WHO DESIRES A THOROUGH COMPENDIUM OF ALL THAT IS ADMIRABLE AND NOTEWORTHY IN THE LITERARY WORLD."—BOSTON POST.

"Ought to find a place in every American home."—N. Y. TIMES.

PUBLISHED WEEKLY, at \$3 00 a year, FREE OF POSTAGE. An extra copy sent gratis to any one getting up a club of five new subscribers.

## EXTRA OFFER FOR 1878.

All new subscribers for 1878, will receive gratis the six numbers of 1877, containing the first instalments of a new serial, "ERICA," translated from the German of Frau von Ingelsleben—the best work of one of the best and brightest authors of Germany. A new story by the charming English authoress, MISS THACKERAY, also appears in the same numbers, from advance sheets, and the usual amount of other valuable matter.

# POTTER'S AMERICAN MONTHLY.

## PUBLISHERS' DEPARTMENT.

Contributions from first-class writers in all parts of the country solicited, our aim being to exhibit diversified talent, culture, observation, experience and knowledge. Manuscripts not used will be returned, if sufficient postage accompanies them.

For their labors to make the AMERICAN MONTHLY worthy of a place in every household where Literature, Art, Science, Romance and History are appreciated, THE PUBLISHERS are pleased to note, oral, written, published and monetary evidences of reward. Both the secular and religious press, at home and abroad, have teemed with words of praise in our behalf. Letters and subscriptions from the educated and refined in all parts of the land speak, "well done!" Thus encouraged in our efforts to give to the reading world an American Magazine unrivalled in matter, variety, illustrations, typographical workmanship—indeed, in every respect—and at a price within the reach of all, we shall go forward,

with renewed energy, to make each succeeding number of the MONTHLY still more attractive than its predecessor—mingling with the serious, flashes of wit and humor—to cheer the reader onward as well as ourselves in life's great missions entrusted to both—hoping thereby to augment our monthly greetings. To the Editorial departments, hitherto attractive features, it will be our desire to add strength and vitality.

In this connection we shall be pardoned for giving extracts from a few representative papers whose good will it is no discredit to earn. Like our readers, they stimulate us in our efforts to disseminate the good, the true, and the beautiful through the medium of our periodical.

## OPINIONS OF THE PRESS.

### Departments Replete with Practical Thoughts.

POTTER'S AMERICAN MONTHLY gives an unequalled variety of sketches, stories, and poems, with other useful and entertaining matter. The editorial departments are replete with thoughts of practical value.—*Daily Gazette, Salem, Mass.*

### Grand Educator of the People.

The AMERICAN MONTHLY is a magazine that ought to find a welcome by thousands of firesides on the Pacific Coast. It is a grand educator of the people, and in many respects has no equal among our splendid array of magazine literature.—*Daily Mercury, San Jose, Cal.*

### Unquestionably the Cheapest in the Country.

Taken altogether this magazine fills a niche in our periodical literature such as no other magazine does, and is unquestionably the cheapest first-class magazine in the country.—*Evening Chronicle, Philadelphia.*

### Instructive—Sterling.

Persons desiring a magazine that will instruct all with whom it may come in contact, should subscribe for POTTER'S AMERICAN MONTHLY. It is a sterling magazine, and deserves unlimited success.—*Delawarean, Dover, Del.*

### The Imprint of Success.

This magazine is in every sense what its name implies—an American periodical—and among its contributors we find many of our best American writers. It bears upon every page the imprint of success.—*Home and Farm, Louisville, Kentucky.*

### Family Magazine of High Literary Character.

POTTER'S AMERICAN MONTHLY comes to us in good time, well filled with matter of interest, and may safely be designated as a Popular Magazine of high literary character.—*Toledo Blade, Ohio.*

### Uniform in Point of Excellence.

This Monthly is full of good, new, bright matter. Though there is uniformity in point of excellence, there is such diversity in subjects and styles that all classes of readers must be specially interested in some one of its articles.—*Daily Times, Oswego, N. Y.*

### Recognised as one of the Best in America.

This first-class periodical is universally recognized as one of the best monthlies in America.—*The Herald, Quincy, Ills.*

### Deservedly Popular—a Gem of Literature.

POTTER'S AMERICAN MONTHLY is one of the best Magazines published in this country, and has rapidly obtained popular favor. It is profusely and beautifully illustrated, and in matter and variety of subjects, is a very valuable and entertaining publication.—*Daily Gazette, Alexandria, Va.*

### Rivals its more Expensive Cotemporaries.

POTTER'S AMERICAN MONTHLY is especially attractive in home matters and fairly rivals its more expensive cotemporaries.—*Journal, Syracuse, N. Y.*

### Credit to Philadelphia.

The MONTHLY contains numerous entertaining and valuable papers, is both an historical and literary magazine, and all of its articles are of the best character. As a magazine it is a credit to Philadelphia.—*The Keystone, Philadelphia.*

### A First-class Popular Magazine.

It has become a first-class family magazine in the range and variety of its contents, and its illustrations are exceedingly fine. There are stories, sketches, poems, and "Notes and Queries," on topics relating to history, literature, art, science, industry, mechanics and current events. The popular taste is well met by this MONTHLY.—*Lutheran Observer, Philadelphia.*

### Peculiarly American Magazine for the Family.

The taste, talent and vigor displayed in this peculiarly American Magazine for the Family and Home make it worthy of its increasing popularity. The Editorial departments are replete with valuable matter. In way of illustrations and variety of subjects it equals in all, and excels in many respects, any similar publication.—*Morning Star, Wilmington, N. C.*

### Richly Illustrated.

The AMERICAN MONTHLY is one of the finest publications in America; it is richly illustrated and filled to overflowing with choice matter. The subscription price is only three dollars per annum, and we do not think the amount could be better invested.—*Evening Journal, Boston.*

### Replete with Fresh Matter.

The magazine is profusely illustrated, and replete with fresh and attractive matter covering a wide variety of topics.—*Free Press, Detroit, Michigan.*

## CABINET SECRETARY OPEN AND CLOSED. THE WOOTON DESKS.

It becomes, when once used, an *absolute necessity*.

## THE Compound Oxygen Treatment

The safest, the greatest, and the most effective Curative Agent  
now known. Eight years of constant practice demonstrates this in  
thousand-fold cases.

We defy the world to bring forward a more brilliant record of cures  
than we do.

It cures the most desperate diseases with which physicians have to  
deal. Milder and gentler with corresponding promptness.  
A new brochure of 100 pages, and other valuable documents contain a  
full account of this wonderful Agent, its mode and extended sphere of  
action, and a most brilliant array of authentic testimonials, fees, etc.,  
to send free.

Office, 1112 GIRARD STREET, PHILADELPHIA.

STARKEY & PALEN.

ANNOUNCEMENT OF THE TENTH VOLUME,  
POTTER'S AMERICAN MONTHLY.

With the new year commences the Tenth Volume of the AMERICAN MONTHLY. At the close of a very prosperous season, in face of the general depression of business the Publishers desire to express their appreciation of the hearty support that has been accorded their efforts in every section of the country; which support at once attests and confirms the emphatic popular fitness of the Magazine and its entertaining and instructing influence with the General Reader.

"THE POPULAR ILLUSTRATED MAGAZINE OF AMERICA."

## FEATURES OF THE AMERICAN MONTHLY.

<b>Adventure, Travel and Narrative</b> - 1	• The attraction of the past and future.
• The importance of the individual's experience.	• A sense of reality.

Scientific, Mechanical, Art, and Critical Productions - An. 18

THREE DOLLARS A YEAR THIRTY CENTS A NUMBER.

The Publishers are determined to make the next twelve numbers worthy of the increasing confidence and patronage of the American people, they will spare no efforts or expense to furnish an entertaining and soon preferable supply of **POPULAR AND INSTRUCTIVE READING.**
